THE HISTORY OF ROME: BOOK I

The Period Anterior to the Abolition of the Monarchy

Preparer's Note

This work contains many literal citations of and references to foreign words, sounds, and alphabetic symbols drawn from many languages, including Gothic and Phoenician, but chiefly Latin and Greek. This English Gutenberg edition, constrained to the characters of 7-bit ASCII code, adopts the following orthographic conventions:

- 1) Except for Greek, all literally cited non-English words that do not refer to texts cited as academic references, words that in the source manuscript appear italicized, are rendered with a single preceding, and a single following dash; thus, -xxxx-.
- 2) Greek words, first transliterated into Roman alphabetic equivalents, are rendered with a preceding and a following double-dash; thus, —xxxx—. Note that in some cases the root word itself is a compound form such as xxx-xxxx, and is rendered as —xxx-xxx—
- 3) Simple unideographic references to vocalic sounds, single letters, or alphabetic diphthongs; and prefixes, suffixes, and syllabic references are represented by a single preceding dash; thus, -x, or -xxx.
- 4) (Especially for the complex discussion of alphabetic evolution in Ch. XIV: Measuring and Writing). Ideographic references, meaning pointers to the form of representation itself rather than to its content, are represented as -"id:xxxx"-. "id:" stands for "ideograph", and indicates that the reader should form a picture based on the following "xxxx"; which may be a single symbol, a word, or an attempt at a picture composed of ASCII characters. E. g. —"id:Gamma gamma"— indicates an uppercase Greek gamma-form followed by the form in lowercase. Some such exotic parsing as this is

necessary to explain alphabetic development because a single symbol may have been used for a number of sounds in a number of languages, or even for a number of sounds in the same language at different times. Thus, -"id:*Gamma* gamma" might very well refer to a Phoenician construct that in appearance resembles the form that eventually stabilized as an uppercase Greek "gamma" juxtaposed to one of lowercase. Also, a construct such as —"id:E" indicates a symbol that with ASCII resembles most closely a Roman uppercase "E", but, in fact, is actually drawn more crudely.

5) Dr. Mommsen has given his dates in terms of Roman usage, A.U.C.; that is, from the founding of Rome, conventionally taken to be 753 B. C. The preparer of this document has appended to the end of this combined text (Books I-V) a table of conversion between the two systems.

Page 3

PREFACE BY THE TRANSLATOR

When the first portion of this translation appeared in 1861, it was accompanied by a Preface, for which I was indebted to the kindness of the late Dr. Schmitz, introducing to the English reader the work of an author whose name and merits, though already known to scholars, were far less widely familiar than they are now. After thirty-three years such an introduction is no longer needed, but none the less gratefully do I recall how much the book owed at the outset to Dr. Schmitz's friendly offices.

The following extracts from my own "Prefatory Note" dated "December 1861" state the circumstances under which I undertook the translation, and give some explanations as to its method and aims:—

"In requesting English scholars to receive with indulgence this first portion of a translation of Dr. Mommsen's 'Romische Geschichte,' I am somewhat in the position of Albinus; who, when appealing to his readers to pardon the imperfections of the Roman History which he had written in indifferent Greek, was met by Cato with the rejoinder that he was not compelled to write at all—that, if the Amphictyonic Council had laid their commands on him, the case would have been different—but that it was quite out of place to ask the indulgence of his readers when his task had been self-imposed. I may state, however, that I did not undertake this task, until I had sought to ascertain whether it was likely to be taken up by any one more qualified to do justice to it. When Dr. Mommsen's work accidentally came into my hands some years after its first appearance, and revived my interest in studies which I had long laid aside for others more strictly professional, I had little doubt that its merits would have already attracted sufficient attention amidst the learned leisure of Oxford to induce some of her great scholars to clothe it in an English dress. But it appeared on inquiry that, while there was a great desire to see it translated, and the purpose of translating it had been entertained in more quarters than one, the projects had from various causes miscarried. Mr. George Robertson published an excellent translation (to which, so far as it goes, I desire to acknowledge my obligations) of the introductory chapters on the early inhabitants of Italy; but other studies and engagements did not permit him to proceed with it. I accordingly requested and obtained Dr. Mommsen's permission to translate his work.

"The translation has been prepared from the third edition of the original, published in the spring of the present year at Berlin. The sheets have been transmitted to Dr. Mommsen, who has kindly communicated to me such suggestions as occurred to him. I have thus been enabled, more especially in the first volume, to correct those passages where I had misapprehended or failed to express the author's meaning, and to incorporate in the English work various additions and corrections which do not appear in the original.

Page 4

"In executing the translation I have endeavoured to follow the original as closely as is consistent with a due regard to the difference of idiom. Many of our translations from the German are so literal as to reproduce the very order of the German sentence, so that they are, if not altogether unintelligible to the English reader, at least far from readable, while others deviate so entirely from the form of the original as to be no longer translations in the proper sense of the term. I have sought to pursue a middle course between a mere literal translation, which would be repulsive, and a loose paraphrase, which would be in the case of such a work peculiarly unsatisfactory. Those who are most conversant with the difficulties of such a task will probably be the most willing to show forbearance towards the shortcomings of my performance, and in particular towards the too numerous traces of the German idiom, which, on glancing over the sheets, I find it still to retain.

"The reader may perhaps be startled by the occurrence now and then of modes of expression more familiar and colloquial than is usually the case in historical works. This, however, is a characteristic feature of the original, to which in fact it owes not a little of its charm. Dr. Mommsen often uses expressions that are not to be found in the dictionary, and he freely takes advantage of the unlimited facilities afforded by the German language for the coinage or the combination of words. I have not unfrequently, in deference to his wishes, used such combinations as 'Carthagino-Sicilian,' 'Romano-Hellenic,' although less congenial to our English idiom, for the sake of avoiding longer periphrases.

"In Dr. Mommsen's book, as in every other German work that has occasion to touch on abstract matters, there occur sentences couched in a peculiar terminology and not very susceptible of translation. There are one or two sentences of this sort, more especially in the chapter on Religion in the 1st volume, and in the critique of Euripides as to which I am not very confident that I have seized or succeeded in expressing the meaning. In these cases I have translated literally.

"In the spelling of proper names I have generally adopted the Latin orthography as more familiar to scholars in this country, except in cases where the spelling adopted by Dr. Mommsen is marked by any special peculiarity. At the same time entire uniformity in this respect has not been aimed at.

"I have ventured in various instances to break up the paragraphs of the original and to furnish them with additional marginal headings, and have carried out more fully the notation of the years B.C. on the margin.

"It is due to Dr. Schmitz, who has kindly encouraged me in this undertaking, that I should state that I alone am responsible for the execution of the translation. Whatever may be thought of it in other respects, I venture to hope that it may convey to the English reader a tolerably accurate impression of the contents and general spirit of the book."

Page 5

In a new Library edition, which appeared in 1868, I incorporated all the additions and alterations which were introduced in the fourth edition of the German, some of which were of considerable importance; and I took the opportunity of revising the translation, so as to make the rendering more accurate and consistent.

Since that time no change has been made, except the issue in 1870 of an Index. But, as Dr. Mommsen was good enough some time ago to send to me a copy in which he had taken the trouble to mark the alterations introduced in the more recent editions of the original, I thought it due to him and to the favour with which the translation had been received that I should subject it to such a fresh revision as should bring it into conformity with the last form (eighth edition) of the German, on which, as I learn from him, he hardly contemplates further change. As compared with the first English edition, the more considerable alterations of addition, omission, or substitution amount, I should think, to well-nigh a hundred pages. I have corrected various errors in renderings, names, and dates (though not without some misgiving that others may have escaped notice or been incurred afresh); and I have still further broken up the text into paragraphs and added marginal headings.

The Index, which was not issued for the German book till nine years after the English translation was published, has now been greatly enlarged from its more recent German form, and has been, at the expenditure of no small labour, adapted to the altered paging of the English. I have also prepared, as an accompaniment to it, a collation of pagings, which will materially facilitate the finding of references made to the original or to the previous English editions.

I have had much reason to be gratified by the favour with which my translation has been received on the part alike of Dr. Mommsen himself and of the numerous English scholars who have made it the basis of their references to his work.⁽¹⁾ I trust that in the altered form and new dress, for which the book is indebted to the printers, it may still further meet the convenience of the reader.

September 1894.

Notes for Preface

1. It has, I believe, been largely in use at Oxford for the last thirty years; but it has not apparently had the good fortune to have come to the knowledge of the writer of an article on "Roman History" published in the Encyclopedia Britannica in 1886, which at least makes no mention of its existence, or yet of Mr. Baring-Gould, who in his *Tragedy of the Caesars* (vol. 1. p. 104f.) has presented Dr. Mommsen's well-known "character" of Caesar in an independent version. His rendering is often more spirited than accurate. While in several cases important words, clauses, or even sentences, are omitted, in others the meaning is loosely or imperfectly conveyed—e.g. in "Hellenistic"

Page 6

for “Hellenic”; “success” for “plenitude of power”; “attempts” or “operations” for “achievements”; “prompt to recover” for “ready to strike”; “swashbuckler” for “brilliant”; “many” for “unyielding”; “accessible to all” for “complaisant towards every one”; “smallest fibre” for “Inmost core”; “ideas” for “ideals”; “unstained with blood” for “as bloodless as possible”; “described” for “apprehended”; “purity” for “clearness”; “smug” for “plain” (or homely); “avoid” for “avert”; “taking his dark course” for “stealing towards his aim by paths of darkness”; “rose” for “transformed himself”; “checked everything like a praetorian domination” for “allowed no hierarchy of marshals or government of praetorians to come into existence”; and in one case the meaning is exactly reversed, when “never sought to soothe, where he could not cure, intractable evils” stands for “never disdained at least to mitigate by palliatives evils that were incurable.”

INTRODUCTORY NOTE BY DR. MOMMSEN

The Varronian computation by years of the City is retained in the text; the figures on the margin indicate the corresponding year before the birth of Christ.

In calculating the corresponding years, the year 1 of the City has been assumed as identical with the year 753 B.C., and with Olymp. 6, 4; although, if we take into account the circumstance that the Roman solar year began with the 1st day of March, and the Greek with the 1st day of July, the year 1 of the City would, according to more exact calculation, correspond to the last ten months of 753 and the first two months of 752 B.C., and to the last four months of Ol. 6, 3 and the first eight of Ol. 6, 4.

The Roman and Greek money has uniformly been commuted on the basis of assuming the libral as and sestertius, and the denarius and Attic drachma, respectively as equal, and taking for all sums above 100 denarii the present value in gold, and for all sums under 100 denarii the present value in silver, of the corresponding weight. The Roman pound (=327.45 grammes) of gold, equal to 4000 sesterces, has thus, according to the ratio of gold to silver 1:15.5, been reckoned at 304 1/2 Prussian thalers [about 43 pounds sterling], and the denarius, according to the value of silver, at 7 Prussian groschen [about 8d.](1)

Kiepert's map will give a clearer idea of the military consolidation of Italy than can be conveyed by any description.

1. I have deemed it, in general, sufficient to give the value of the Roman money approximately in round numbers, assuming for that purpose 100 sesterces as equivalent to 1 pound sterling.—*Tr.*

CHAPTER I

Introduction

Ancient History

The Mediterranean Sea with its various branches, penetrating far into the great Continent, forms the largest gulf of the ocean, and, alternately narrowed by islands or projections of the land and expanding to considerable breadth, at once separates and connects the three divisions of the Old World. The shores of this inland sea were in ancient times peopled by various nations belonging in an ethnographical and philological point of view to different races, but constituting in their historical aspect one whole. This historic whole has been usually, but not very appropriately, entitled the history of the ancient world. It is in reality the history of civilization among the Mediterranean nations; and, as it passes before us in its successive stages, it presents four great phases of development—the history of the Coptic or Egyptian stock dwelling on the southern shore, the history of the Aramaean or Syrian nation which occupied the east coast and extended into the interior of Asia as far as the Euphrates and Tigris, and the histories of the twin-peoples, the Hellenes and Italians, who received as their heritage the countries on the European shore. Each of these histories was in its earlier stages connected with other regions and with other cycles of historical evolution; but each soon entered on its own distinctive career. The surrounding nations of alien or even of kindred extraction—the Berbers and Negroes of Africa, the Arabs, Persians, and Indians of Asia, the Celts and Germans of Europe—came into manifold contact with the peoples inhabiting the borders of the Mediterranean, but they neither imparted unto them nor received from them any influences exercising decisive effect on their respective destinies. So far, therefore, as cycles of culture admit of demarcation at all, the cycle which has its culminating points

Page 8

denoted by the names Thebes, Carthage, Athens, and Rome, may be regarded as an unity. The four nations represented by these names, after each of them had attained in a path of its own a peculiar and noble civilization, mingled with one another in the most varied relations of reciprocal intercourse, and skilfully elaborated and richly developed all the elements of human nature. At length their cycle was accomplished. New peoples who hitherto had only laved the territories of the states of the Mediterranean, as waves lave the beach, overflowed both its shores, severed the history of its south coast from that of the north, and transferred the centre of civilization from the Mediterranean to the Atlantic Ocean. The distinction between ancient and modern history, therefore, is no mere accident, nor yet a mere matter of chronological convenience. What is called modern history is in reality the formation of a new cycle of culture, connected in several stages of its development with the perishing or perished civilization of the Mediterranean states, as this was connected with the primitive civilization of the Indo-Germanic stock, but destined, like the earlier cycle, to traverse an orbit of its own. It too is destined to experience in full measure the vicissitudes of national weal and woe, the periods of growth, of maturity, and of age, the blessedness of creative effort in religion, polity, and art, the comfort of enjoying the material and intellectual acquisitions which it has won, perhaps also, some day, the decay of productive power in the satiety of contentment with the goal attained. And yet this goal will only be temporary: the grandest system of civilization has its orbit, and may complete its course but not so the human race, to which, just when it seems to have reached its goal, the old task is ever set anew with a wider range and with a deeper meaning.

Italy

Our aim is to exhibit the last act of this great historical drama, to relate the ancient history of the central peninsula projecting from the northern continent into the Mediterranean. It is formed by the mountain-system of the Apennines branching off in a southern direction from the western Alps. The Apennines take in the first instance a south-eastern course between the broader gulf of the Mediterranean on the west, and the narrow one on the east; and in the close vicinity of the latter they attain their greatest elevation, which, however, scarce reaches the line of perpetual snow, in the Abruzzi. From the Abruzzi the chain continues in a southern direction, at first undivided and of considerable height; after a depression which forms a hill-country, it splits into a somewhat flattened succession of heights towards the south-east and a more rugged chain towards the south, and in both directions terminates in the formation of narrow peninsulas.

Page 9

The flat country on the north, extending between the Alps and the Apennines as far down as the Abruzzi, does not belong geographically, nor until a very late period even historically, to the southern land of mountain and hill, the Italy whose history is here to engage our attention. It was not till the seventh century of the city that the coast-district from Sinigaglia to Rimini, and not till the eighth that the basin of the Po, became incorporated with Italy. The ancient boundary of Italy on the north was not the Alps but the Apennines. This mountain-system nowhere rises abruptly into a precipitous chain, but, spreading broadly over the land and enclosing many valleys and table-lands connected by easy passes, presents conditions which well adapt it to become the settlement of man. Still more suitable in this respect are the adjacent slopes and the coast-districts on the east, south, and west. On the east coast the plain of Apulia, shut in towards the north by the mountain-block of the Abruzzi and only broken by the steep isolated ridge of Garganus, stretches in a uniform level with but a scanty development of coast and stream. On the south coast, between the two peninsulas in which the Apennines terminate, extensive lowlands, poorly provided with harbours but well watered and fertile, adjoin the hill-country of the interior. The west coast presents a far-stretching domain intersected by considerable streams, in particular by the Tiber, and shaped by the action of the waves and of the once numerous volcanoes into manifold variety of hill and valley, harbour and island. Here the regions of Etruria, Latium, and Campania form the very flower of the land of Italy. South of Campania, the land in front of the mountains gradually diminishes, and the Tyrrhenian Sea almost washes their base. Moreover, as the Peloponnesus is attached to Greece, so the island of Sicily is attached to Italy—the largest and fairest isle of the Mediterranean, having a mountainous and partly desert interior, but girt, especially on the east and south, by a broad belt of the finest coast-land, mainly the result of volcanic action. Geographically the Sicilian mountains are a continuation of the Apennines, hardly interrupted by the narrow “rent” —Pegion—of the straits; and in its historical relations Sicily was in earlier times quite as decidedly a part of Italy as the Peloponnesus was of Greece, a field for the struggles of the same races, and the seat of a similar superior civilization.

The Italian peninsula resembles the Grecian in the temperate climate and wholesome air that prevail on the hills of moderate height, and on the whole, also, in the valleys and plains. In development of coast it is inferior; it wants, in particular, the island-studded sea which made the Hellenes a seafaring nation. Italy on the other hand excels its neighbour in the rich alluvial plains and the fertile and grassy mountain-slopes, which are requisite for agriculture and the rearing of cattle. Like Greece, it is a noble land which calls forth and rewards the energies of man, opening up alike for restless adventure the way to distant lands and for quiet exertion modes of peaceful gain at home.

Page 10

But, while the Grecian peninsula is turned towards the east, the Italian is turned towards the west. As the coasts of Epirus and Acarnania had but a subordinate importance in the case of Hellas, so had the Apulian and Messapian coasts in that of Italy; and, while the regions on which the historical development of Greece has been mainly dependent—Attica and Macedonia—look to the east, Etruria, Latium, and Campania look to the west. In this way the two peninsulas, so close neighbours and almost sisters, stand as it were averted from each other. Although the naked eye can discern from Otranto the Acroceraunian mountains, the Italians and Hellenes came into earlier and closer contact on every other pathway rather than on the nearest across the Adriatic Sea. In their instance, as has happened so often, the historical vocation of the nations was prefigured in the relations of the ground which they occupied; the two great stocks, on which the civilization of the ancient world grew, threw their shadow as well as their seed, the one towards the east, the other towards the west.

Italian History

We intend here to relate the history of Italy, not simply the history of the city of Rome. Although, in the formal sense of political law, it was the civic community of Rome which gained the sovereignty first of Italy and then of the world, such a view cannot be held to express the higher and real meaning of history. What has been called the subjugation of Italy by the Romans appears rather, when viewed in its true light, as the consolidation into an united state of the whole Italian stock—a stock of which the Romans were doubtless the most powerful branch, but still were only a branch.

The history of Italy falls into two main sections: (1) its internal history down to its union under the leadership of the Latin stock, and (2) the history of its sovereignty over the world. Under the first section, which will occupy the first two books, we shall have to set forth the settlement of the Italian stock in the peninsula; the imperilling of its national and political existence, and its partial subjugation, by nations of other descent and older civilization, Greeks and Etruscans; the revolt of the Italians against the strangers, and the annihilation or subjection of the latter; finally, the struggles between the two chief Italian stocks, the Latins and the Samnites, for the hegemony of the peninsula, and the victory of the Latins at the end of the fourth century before the birth of Christ—or of the fifth century of the city. The second section opens with the Punic wars; it embraces the rapid extension of the dominion of Rome up to and beyond the natural boundaries of Italy, the long status quo of the imperial period, and the collapse of the mighty empire. These events will be narrated in the third and following books.

Notes for Book I Chapter I

Page 11

1. The dates as hereafter inserted in the text are years of the City (A.U.C.); those in the margin give the corresponding years B.C.

CHAPTER II

The Earliest Migrations into Italy

Primitive Races of Italy

We have no information, not even a tradition, concerning the first migration of the human race into Italy. It was the universal belief of antiquity that in Italy, as well as elsewhere, the first population had sprung from the soil. We leave it to the province of the naturalist to decide the question of the origin of different races, and of the influence of climate in producing their diversities. In a historical point of view it is neither possible, nor is it of any importance, to determine whether the oldest recorded population of a country were autochthones or immigrants. But it is incumbent on the historical inquirer to bring to light the successive strata of population in the country of which he treats, in order to trace, from as remote an epoch as possible, the gradual progress of civilization to more perfect forms, and the suppression of races less capable of, or less advanced in, culture by nations of higher standing.

Italy is singularly poor in memorials of the primitive period, and presents in this respect a remarkable contrast to other fields of civilization. The results of German archaeological research lead to the conclusion that in England, France, the North of Germany and Scandinavia, before the settlement of the Indo-Germans in those lands, there must have dwelt, or rather roamed, a people, perhaps of Mongolian race, gaining their subsistence by hunting and fishing, making their implements of stone, clay, or bones, adorning themselves with the teeth of animals and with amber, but unacquainted with agriculture and the use of the metals. In India, in like manner, the Indo-Germanic settlers were preceded by a dark-coloured population less susceptible of culture. But in Italy we neither meet with fragments of a supplanted nation, such as the Finns and Lapps in the Celto-Germanic domain and the black tribes in the Indian mountains; nor have any remains of an extinct primitive people been hitherto pointed out there, such as appear to be revealed in the peculiarly-formed skeletons, the places of assembling, and the burial mounds of what is called the stone-period of Germanic antiquity. Nothing has hitherto been brought to light to warrant the supposition that mankind existed in Italy at a period anterior to the knowledge of agriculture and of the smelting of the metals; and if the human race ever within the bounds of Italy really occupied the level of that primitive stage of culture which we are accustomed to call the savage state, every trace of such a fact has disappeared.

Page 12

Individual tribes, or in other words, races or stocks, are the constituent elements of the earliest history. Among the stocks which in later times we meet with in Italy, the immigration of some, of the Hellenes for instance, and the denationalization of others, such as the Bruttians and the inhabitants of the Sabine territory, are historically attested. Setting aside both these classes, there remain a number of stocks whose wanderings can no longer be traced by means of historical testimony, but only by a priori inference, and whose nationality cannot be shown to have undergone any radical change from external causes. To establish the national individuality of these is the first aim of our inquiry. In such an inquiry, had we nothing to fall back upon but the chaotic mass of names of tribes and the confusion of what professes to be historical tradition, the task might well be abandoned as hopeless. The conventionally received tradition, which assumes the name of history, is composed of a few serviceable notices by civilized travellers, and a mass of mostly worthless legends, which have usually been combined with little discrimination of the true character either of legend or of history. But there is another source of tradition to which we may resort, and which yields information fragmentary but authentic; we mean the indigenous languages of the stocks settled in Italy from time immemorial. These languages, which have grown with the growth of the peoples themselves, have had the stamp of their process of growth impressed upon them too deeply to be wholly effaced by subsequent civilization. One only of the Italian languages is known to us completely; but the remains which have been preserved of several of the others are sufficient to afford a basis for historical inquiry regarding the existence, and the degrees, of family relationship among the several languages and peoples.

In this way philological research teaches us to distinguish three primitive Italian stocks, the Iapygian, the Etruscan, and that which we shall call the Italian. The last is divided into two main branches,—the Latin branch, and that to which the dialects of the Umbri, Marsi, Volsci, and Samnites belong.

Iapygians

As to the Iapygian stock, we have but little information. At the south-eastern extremity of Italy, in the Messapian or Calabrian peninsula, inscriptions in a peculiar extinct language⁽¹⁾ have been found in considerable numbers; undoubtedly remains of the dialect of the Iapygians, who are very distinctly pronounced by tradition also to have been different from the Latin and Samnite stocks. Statements deserving of credit and numerous indications lead to the conclusion that the same language and the same stock were indigenous also in Apulia. What we at present know of this people suffices to show clearly that they were distinct from the other Italians, but does not suffice to determine what position

Page 13

should be assigned to them and to their language in the history of the human race. The inscriptions have not yet been, and it is scarcely to be expected that they ever will be, deciphered. The genitive forms, -aihi- and -ihi-, corresponding to the Sanscrit -asya- and the Greek —oio—, appear to indicate that the dialect belongs to the Indo-Germanic family. Other indications, such as the use of the aspirated consonants and the avoiding of the letters m and t as terminal sounds, show that this lapygian dialect was essentially different from the Italian and corresponded in some respects to the Greek dialects. The supposition of an especially close affinity between the lapygian nation and the Hellenes finds further support in the frequent occurrence of the names of Greek divinities in the inscriptions, and in the surprising facility with which that people became Hellenized, presenting a striking contrast to the shyness in this respect of the other Italian nations. Apulia, which in the time of Timaeus (400) was still described as a barbarous land, had in the sixth century of the city become a province thoroughly Greek, although no direct colonization from Greece had taken place; and even among the ruder stock of the Messapii there are various indications of a similar tendency. With the recognition of such a general family relationship or peculiar affinity between the lapygians and Hellenes (a recognition, however, which by no means goes so far as to warrant our taking the lapygian language to be a rude dialect of Greek), investigation must rest content, at least in the meantime, until some more precise and better assured result be attainable.(2) The lack of information, however, is not much felt; for this race, already on the decline at the period when our history begins, comes before us only when it is giving way and disappearing. The character of the lapygian people, little capable of resistance, easily merging into other nationalities, agrees well with the hypothesis, to which their geographical position adds probability, that they were the oldest immigrants or the historical autochthones of Italy. There can be no doubt that all the primitive migrations of nations took place by land; especially such as were directed towards Italy, the coast of which was accessible by sea only to skilful sailors and on that account was still in Homer's time wholly unknown to the Hellenes. But if the earlier settlers came over the Apennines, then, as the geologist infers the origin of mountains from their stratification, the historical inquirer may hazard the conjecture that the stocks pushed furthest towards the south were the oldest inhabitants of Italy; and it is just at its extreme south-eastern verge that we meet with the lapygian nation.

Italians

Page 14

The middle of the peninsula was inhabited, as far back as trustworthy tradition reaches, by two peoples or rather two branches of the same people, whose position in the Indo-Germanic family admits of being determined with greater precision than that of the Iapygian nation. We may with propriety call this people the Italian, since upon it rests the historical significance of the peninsula. It is divided into the two branch-stocks of the Latins and the Umbrians; the latter including their southern offshoots, the Marsians and Samnites, and the colonies sent forth by the Samnites in historical times. The philological analysis of the idioms of these stocks has shown that they together constitute a link in the Indo-Germanic chain of languages, and that the epoch in which they still formed an unity is a comparatively late one. In their system of sounds there appears the peculiar spirant -f, in the use of which they agree with the Etruscans, but decidedly differ from all Hellenic and Helleno-barbaric races as well as from the Sanscrit itself. The aspirates, again, which are retained by the Greeks throughout, and the harsher of them also by the Etruscans, were originally foreign to the Italians, and are represented among them by one of their elements—either by the media, or by the breathing alone -f or -h. The finer spirants, -s, -w, -j, which the Greeks dispense with as much as possible, have been retained in the Italian languages almost unimpaired, and have been in some instances still further developed. The throwing back of the accent and the consequent destruction of terminations are common to the Italians with some Greek stocks and with the Etruscans; but among the Italians this was done to a greater extent than among the former, and to a lesser extent than among the latter. The excessive disorder of the terminations in the Umbrian certainly had no foundation in the original spirit of the language, but was a corruption of later date, which appeared in a similar although weaker tendency also at Rome. Accordingly in the Italian languages short vowels are regularly dropped in the final sound, long ones frequently: the concluding consonants, on the other hand, have been tenaciously retained in the Latin and still more so in the Samnite; while the Umbrian drops even these. In connection with this we find that the middle voice has left but slight traces in the Italian languages, and a peculiar passive formed by the addition of -r takes its place; and further that the majority of the tenses are formed by composition with the roots -es and -fu, while the richer terminational system of the Greeks along with the augment enables them in great part to dispense with auxiliary verbs. While the Italian languages, like the Aeolic dialect, gave up the dual, they retained universally the ablative which the Greeks lost, and in great part also the locative. The rigorous logic of the Italians appears to have taken offence at the splitting of the idea of plurality into that of duality and of multitude; while they have continued with much precision to express the relations of words by inflections. A feature peculiarly Italian, and unknown even to the Sanscrit, is the mode of imparting a substantive character to the verb by gerunds and supines,—a process carried out more completely here than in any other language.

Page 15

Relation of the Italians to the Greeks

These examples selected from a great abundance of analogous phenomena suffice to establish the individuality of the Italian stock as distinguished from the other members of the Indo-Germanic family, and at the same time show it to be linguistically the nearest relative, as it is geographically the next neighbour, of the Greek. The Greek and the Italian are brothers; the Celt, the German, and the Slavonian are their cousins. The essential unity of all the Italian as of all the Greek dialects and stocks must have dawned early and clearly on the consciousness of the two great nations themselves; for we find in the Roman language a very ancient word of enigmatical origin, -Grai-us-or -Graicus-, which is applied to every Greek, and in like manner amongst the Greeks the analogous appellation —Opikos— which is applied to all the Latin and Samnite stocks known to the Greeks in earlier times, but never to the Iapygians or Etruscans.

Relation of the Latins to the Umbro-Samnites

Among the languages of the Italian stock, again, the Latin stands in marked contrast with the Umbro-Samnite dialects. It is true that of these only two, the Umbrian and the Samnite or Oscan, are in some degree known to us, and these even in a manner extremely defective and uncertain. Of the rest some, such as the Marsian and the Volscian, have reached us in fragments too scanty to enable us to form any conception of their individual peculiarities or to classify the varieties of dialect themselves with certainty and precision, while others, like the Sabine, have, with the exception of a few traces preserved as dialectic peculiarities in provincial Latin, completely disappeared. A conjoint view, however, of the facts of language and of history leaves no doubt that all these dialects belonged to the Umbro-Samnite branch of the great Italian stock, and that this branch, although much more closely related to Latin than to Greek, was very decidedly distinct from the Latin. In the pronoun and other cases frequently the Samnite and Umbrian used -p where the Roman used -q, as -pis- for -quis-; just as languages otherwise closely related are found to differ; for instance, -p is peculiar to the Celtic in Brittany and Wales, -k to the Gaelic and Erse. Among the vowel sounds the diphthongs in Latin, and in the northern dialects generally, appear very much destroyed, whereas in the southern Italian dialects they have suffered little; and connected with this is the fact, that in composition the Roman weakens the radical vowel otherwise so strictly preserved,—a modification which does not take place in the kindred group of languages. The genitive of words in -a is in this group as among the Greeks -as, among the Romans in the matured language -ae; that of words in -us is in the Samnite -eis, in the Umbrian -es, among the Romans -ei; the locative disappeared more

Page 16

and more from the language of the latter, while it continued in full use in the other Italian dialects; the dative plural in -bus is extant only in Latin. The Umbro-Samnite infinitive in -um is foreign to the Romans; while the Osco-Umbrian future formed from the root -es after the Greek fashion (-her-est- like —leg-so—) has almost, perhaps altogether, disappeared in Latin, and its place is supplied by the optative of the simple verb or by analogous formations from -fuo-(-amabo-). In many of these instances, however—in the forms of the cases, for example—the differences only exist in the two languages when fully formed, while at the outset they coincide. It thus appears that, while the Italian language holds an independent position by the side of the Greek, the Latin dialect within it bears a relation to the Umbro-Samnite somewhat similar to that of the Ionic to the Doric; and the differences of the Oscan and Umbrian and kindred dialects may be compared with the differences between the Dorism of Sicily and the Dorism of Sparta.

Each of these linguistic phenomena is the result and the attestation of an historical event. With perfect certainty they guide us to the conclusion, that from the common cradle of peoples and languages there issued a stock which embraced in common the ancestors of the Greeks and the Italians; that from this, at a subsequent period, the Italians branched off; and that these again divided into the western and eastern stocks, while at a still later date the eastern became subdivided into Umbrians and Oscans.

When and where these separations took place, language of course cannot tell; and scarce may adventurous thought attempt to grope its conjectural way along the course of those revolutions, the earliest of which undoubtedly took place long before that migration which brought the ancestors of the Italians across the Apennines. On the other hand the comparison of languages, when conducted with accuracy and caution, may give us an approximate idea of the degree of culture which the people had reached when these separations took place, and so furnish us with the beginnings of history, which is nothing but the development of civilization. For language, especially in the period of its formation, is the true image and organ of the degree of civilization attained; its archives preserve evidence of the great revolutions in arts and in manners, and from its records the future will not fail to draw information as to those times regarding which the voice of direct tradition is dumb.

Indo-Germanic Culture

Page 17

During the period when the Indo-Germanic nations which are now separated still formed one stock speaking the same language, they attained a certain stage of culture, and they had a vocabulary corresponding to it. This vocabulary the several nations carried along with them, in its conventionally established use, as a common dowry and a foundation for further structures of their own. In it we find not merely the simplest terms denoting existence, actions, perceptions, such as -sum-, -do-, -pater-, the original echo of the impression which the external world made on the mind of man, but also a number of words indicative of culture (not only as respects their roots, but in a form stamped upon them by custom) which are the common property of the Indo-Germanic family, and which cannot be explained either on the principle of an uniform development in the several languages, or on the supposition of their having subsequently borrowed one from another. In this way we possess evidence of the development of pastoral life at that remote epoch in the unalterably fixed names of domestic animals; the Sanscrit -gaus- is the Latin -bos-, the Greek —bous—; Sanscrit -avis- is the Latin -ovis-, Greek —ois—; Sanscrit -asvas-, Latin -equus-, Greek —ippos—; Sanscrit -hansas-, Latin -anser-, Greek —chein—; Sanscrit -atis-, Latin -anas-, Greek —neissa—; in like manner -pecus-, -sus-, -porcus-, -taurus-, -canis-, are Sanscrit words. Even at this remote period accordingly the stock, on which from the days of Homer down to our own time the intellectual development of mankind has been dependent, had already advanced beyond the lowest stage of civilization, the hunting and fishing epoch, and had attained at least comparative fixity of abode. On the other hand, we have as yet no certain proofs of the existence of agriculture at this period. Language rather favours the negative view. Of the Latin-Greek names of grain none occurs in Sanscrit with the single exception of —zea—, which philologically represents the Sanscrit -yavas-, but denotes in the Indian barley, in Greek spelt. It must indeed be granted that this diversity in the names of cultivated plants, which so strongly contrasts with the essential agreement in the appellations of domestic animals, does not absolutely preclude the supposition of a common original agriculture. In the circumstances of primitive times transport and acclimatizing are more difficult in the case of plants than of animals; and the cultivation of rice among the Indians, that of wheat and spelt among the Greeks and Romans, and that of rye and oats among the Germans and Celts, may all be traceable to a common system of primitive tillage. On the other hand the name of one cereal common to the Greeks and Indians only proves, at the most, that before the separation of the stocks they gathered and ate the grains of barley and spelt growing wild in Mesopotamia,(3) not that they already cultivated grain. While, however,

Page 18

we reach no decisive result in this way, a further light is thrown on the subject by our observing that a number of the most important words bearing on this province of culture occur certainly in Sanscrit, but all of them in a more general signification. -Agras-among the Indians denotes a level surface in general; -kurnu-, anything pounded; -aritrām-, oar and ship; -venas-, that which is pleasant in general, particularly a pleasant drink. The words are thus very ancient; but their more definite application to the field (-ager-), to the grain to be ground (-granum-), to the implement which furrows the soil as the ship furrows the surface of the sea (-aratrum-), to the juice of the grape (-vinum-), had not yet taken place when the earliest division of the stocks occurred, and it is not to be wondered at that their subsequent applications came to be in some instances very different, and that, for example, the corn intended to be ground, as well as the mill for grinding it (Gothic -quairinus-, Lithuanian -girnos-,⁽⁴⁾) received their names from the Sanscrit -kurnu-. We may accordingly assume it as probable, that the primeval Indo-Germanic people were not yet acquainted with agriculture, and as certain, that, if they were so, it played but a very subordinate part in their economy; for had it at that time held the place which it afterwards held among the Greeks and Romans, it would have left a deeper impression upon the language.

On the other hand the building of houses and huts by the Indo-Germans is attested by the Sanscrit -dam(as)-, Latin -domus-, Greek —domos—; Sanscrit -vesas-, Latin -vicus-, Greek —oikos—; Sanscrit -dvaras-, Latin -fores-, Greek —thura—; further, the building of oar-boats by the names of the boat, Sanscrit -naus-, Latin -navis-, Greek —naus—, and of the oar, Sanscrit -aritrām-, Greek —eretmos—, Latin -remus-, -tri-res-mis-; and the use of waggons and the breaking in of animals for draught and transport by the Sanscrit -akshas-(axle and cart), Latin -axis-, Greek —axon—, —am-axa—; Sanscrit -iugam-, Latin -iugum-, Greek —zugon—. The words that denote clothing-Sanscrit -vastra-, Latin -vestis-, Greek —esthes—; as well as those that denote sewing and spinning-Sanscrit -siv-, Latin -suo-; Sanscrit -nah-, Latin -neo-, Greek —netho—, are alike in all Indo-Germanic languages. This cannot, however, be equally affirmed of the higher art of weaving.⁽⁵⁾ The knowledge of the use of fire in preparing food, and of salt for seasoning it, is a primeval heritage of the Indo-Germanic nations; and the same may be affirmed regarding the knowledge of the earliest metals employed as implements or ornaments by man. At least the names of copper (-aes-) and silver (-argentum-), perhaps also of gold, are met with in Sanscrit, and these names can scarcely have originated before man had learned to separate and to utilize the ores; the Sanscrit -asis-, Latin -ensis-, points in fact to the primeval use of metallic weapons.

Page 19

No less do we find extending back into those times the fundamental ideas on which the development of all Indo-Germanic states ultimately rests; the relative position of husband and wife, the arrangement in clans, the priesthood of the father of the household and the absence of a special sacerdotal class as well as of all distinctions of caste in general, slavery as a legitimate institution, the days of publicly dispensing justice at the new and full moon. On the other hand the positive organization of the body politic, the decision of the questions between regal sovereignty and the sovereignty of the community, between the hereditary privilege of royal and noble houses and the unconditional legal equality of the citizens, belong altogether to a later age.

Even the elements of science and religion show traces of a community of origin. The numbers are the same up to one hundred (Sanskrit -satam-, -ekasatam-, Latin -centum-, Greek —e-katon—, Gothic -hund-); and the moon receives her name in all languages from the fact that men measure time by her (-mensis-). The idea of Deity itself (Sanskrit -devas-, Latin -deus-, Greek —theos—), and many of the oldest conceptions of religion and of natural symbolism, belong to the common inheritance of the nations. The conception, for example, of heaven as the father and of earth as the mother of being, the festal expeditions of the gods who proceed from place to place in their own chariots along carefully levelled paths, the shadowy continuation of the soul's existence after death, are fundamental ideas of the Indian as well as of the Greek and Roman mythologies. Several of the gods of the Ganges coincide even in name with those worshipped on the Ilissus and the Tiber:—thus the Uranus of the Greeks is the Varunas, their Zeus, Jovis pater, Diespiter is the Djaus pita of the Vedas. An unexpected light has been thrown on various enigmatical forms in the Hellenic mythology by recent researches regarding the earlier divinities of India. The hoary mysterious forms of the Erinnyes are no Hellenic invention; they were immigrants along with the oldest settlers from the East. The divine greyhound Sarama, who guards for the Lord of heaven the golden herd of stars and sunbeams and collects for him the nourishing rain-clouds as the cows of heaven to the milking, and who moreover faithfully conducts the pious dead into the world of the blessed, becomes in the hands of the Greeks the son of Sarama, Sarameyas, or Hermeias; and the enigmatical Hellenic story of the stealing of the cattle of Helios, which is beyond doubt connected with the Roman legend about Cacus, is now seen to be a last echo (with the meaning no longer understood) of that old fanciful and significant conception of nature.

Graeco-Italian Culture

The task, however, of determining the degree of culture which the Indo-Germans had attained before the separation of the stocks properly belongs to the general history of the ancient world. It is on the other hand the special task of Italian history to ascertain, so far as it is possible, what was the state of the Graeco-Italian nation when the Hellenes and the Italians parted. Nor is this a superfluous labour; we reach by means

of it the stage at which Italian civilization commenced, the starting-point of the national history.

Page 20

Agriculture

While it is probable that the Indo-Germans led a pastoral life and were acquainted with the cereals, if at all, only in their wild state, all indications point to the conclusion that the Graeco-Italians were a grain-cultivating, perhaps even a vine-cultivating, people. The evidence of this is not simply the knowledge of agriculture itself common to both, for this does not upon the whole warrant the inference of community of origin in the peoples who may exhibit it. An historical connection between the Indo-Germanic agriculture and that of the Chinese, Aramaean, and Egyptian stocks can hardly be disputed; and yet these stocks are either alien to the Indo-Germans, or at any rate became separated from them at a time when agriculture was certainly still unknown. The truth is, that the more advanced races in ancient times were, as at the present day, constantly exchanging the implements and the plants employed in cultivation; and when the annals of China refer the origin of Chinese agriculture to the introduction of five species of grain that took place under a particular king in a particular year, the story undoubtedly depicts correctly, at least in a general way, the relations subsisting in the earliest epochs of civilization. A common knowledge of agriculture, like a common knowledge of the alphabet, of war chariots, of purple, and other implements and ornaments, far more frequently warrants the inference of an ancient intercourse between nations than of their original unity. But as regards the Greeks and Italians, whose mutual relations are comparatively well known, the hypothesis that agriculture as well as writing and coinage first came to Italy by means of the Hellenes may be characterized as wholly inadmissible. On the other hand, the existence of a most intimate connection between the agriculture of the one country and that of the other is attested by their possessing in common all the oldest expressions relating to it; -ager-, —agros—; -aro aratrum-, —aroo arotron—; -ligo-alongside of —lachaino—; -hortus-, —chortos—; -hordeum-, —krithei—; -miliun-, —melinei—; -rapa-, —raphanis—; -malva-, —malachei—; -vinum-, —oinos—. It is likewise attested by the agreement of Greek and Italian agriculture in the form of the plough, which appears of the same shape on the old Attic and the old Roman monuments; in the choice of the most ancient kinds of grain, millet, barley, spelt; in the custom of cutting the ears with the sickle and having them trodden out by cattle on the smooth-beaten threshing-floor; lastly, in the mode of preparing the grain -puls—-poltos—, -pinso- —ptisso—, -mola- —mulei—; for baking was of more recent origin, and on that account dough or pap was always used in the Roman ritual instead of bread. That the culture of the vine too in Italy was anterior to the earliest Greek immigration, is shown by the appellation “wine-land” (—Oinotria—), which appears

Page 21

to reach back to the oldest visits of Greek voyagers. It would thus appear that the transition from pastoral life to agriculture, or, to speak more correctly, the combination of agriculture with the earlier pastoral economy, must have taken place after the Indians had departed from the common cradle of the nations, but before the Hellenes and Italians dissolved their ancient communion. Moreover, at the time when agriculture originated, the Hellenes and Italians appear to have been united as one national whole not merely with each other, but with other members of the great family; at least, it is a fact, that the most important of those terms of cultivation, while they are foreign to the Asiatic members of the Indo-Germanic family, are used by the Romans and Greeks in common with the Celtic as well as the Germanic, Slavonic, and Lithuanian stocks.(6)

The distinction between the common inheritance of the nations and their own subsequent acquisitions in manners and in language is still far from having been wrought out in all the variety of its details and gradations. The investigation of languages with this view has scarcely begun, and history still in the main derives its representation of primitive times, not from the rich mine of language, but from what must be called for the most part the rubbish-heap of tradition. For the present, therefore, it must suffice to indicate the differences between the culture of the Indo-Germanic family in its oldest undivided form, and the culture of that epoch when the Graeco-Italians still lived together. The task of discriminating the results of culture which are common to the European members of this family, but foreign to its Asiatic members, from those which the several European groups, such as the Graeco-Italian and the Germano-Slavonic, have wrought out for themselves, can only be accomplished, if at all, after greater progress has been made in linguistic and historical inquiries. But there can be no doubt that, with the Graeco-Italians as with all other nations, agriculture became and in the mind of the people remained the germ and core of their national and of their private life. The house and the fixed hearth, which the husbandman constructs instead of the light hut and shifting fireplace of the shepherd, are represented in the spiritual domain and idealized in the goddess Vesta or —Estia— almost the only divinity not Indo-Germanic yet from the first common to both nations. One of the oldest legends of the Italian stock ascribes to king Italus, or, as the Italians must have pronounced the word, Vitalus or Vitulus, the introduction of the change from a pastoral to an agricultural life, and shrewdly connects with it the original Italian legislation. We have simply another version of the same belief in the legend of the Samnite stock which makes the ox the leader of their primitive colonies, and in the oldest Latin national names which designate the people as reapers (-Siculi-, perhaps also -Sicani-), or as field-labourers (-Opsci-). It is one of the characteristic incongruities which attach to the so-called legend of the origin of Rome, that it represents a pastoral and hunting people as founding a city. Legend and faith, laws and manners, among the Italians as among the Hellenes are throughout associated with agriculture.(7)

Page 22

Cultivation of the soil cannot be conceived without some measurement of it, however rude. Accordingly, the measures of surface and the mode of setting off boundaries rest, like agriculture itself, on a like basis among both peoples. The Oscan and Umbrian -vorsus- of one hundred square feet corresponds exactly with the Greek —plethron—. The principle of marking off boundaries was also the same. The land-measurer adjusted his position with reference to one of the cardinal points, and proceeded to draw in the first place two lines, one from north to south, and another from east to west, his station being at their point of intersection (-templum-, —temenos— from —temno—); then he drew at certain fixed distances lines parallel to these, and by this process produced a series of rectangular pieces of ground, the corners of which were marked by boundary posts (-termini-, in Sicilian inscriptions -termones-, usually —oroi—). This mode of defining boundaries, which is probably also Etruscan but is hardly of Etruscan origin, we find among the Romans, Umbrians, Samnites, and also in very ancient records of the Tarentine Heracleots, who are as little likely to have borrowed it from the Italians as the Italians from the Tarentines: it is an ancient possession common to all. A peculiar characteristic of the Romans, on the other hand, was their rigid carrying out of the principle of the square; even where the sea or a river formed a natural boundary, they did not accept it, but wound up their allocation of the land with the last complete square.

Other Features of Their Economy

It is not solely in agriculture, however, that the especially close relationship of the Greeks and Italians appears; it is unmistakably manifest also in the other provinces of man's earliest activity. The Greek house, as described by Homer, differs little from the model which was always adhered to in Italy. The essential portion, which originally formed the whole interior accommodation of the Latin house, was the -atrium-, that is, the "blackened" chamber, with the household altar, the marriage bed, the table for meals, and the hearth; and precisely similar is the Homeric —megaron—, with its household altar and hearth and smoke-begrimed roof. We cannot say the same of ship-building. The boat with oars was an old common possession of the Indo-Germans; but the advance to the use of sailing vessels can scarcely be considered to have taken place during the Graeco-Italian period, for we find no nautical terms originally common to the Greeks and Italians except such as are also general among the Indo-Germanic family. On the other hand the primitive Italian custom of the husbandmen having common midday meals, the origin of which the myth connects with the introduction of agriculture, is compared by Aristotle with the Cretan Syssitia; and the earliest Romans further agreed with the Cretans and Laconians in taking their meals

Page 23

not, as was afterwards the custom among both peoples, in a reclining, but in a sitting posture. The mode of kindling fire by the friction of two pieces of wood of different kinds is common to all peoples; but it is certainly no mere accident that the Greeks and Italians agree in the appellations which they give to the two portions of the touch-wood, “the rubber” (—trypanon—, -terebra-), and the “under-layer” (—storeus—, —eschara—, -tabula-, probably from -tendere-, —tetamai—). In like manner the dress of the two peoples is essentially identical, for the -tunica- quite corresponds with the —chiton—, and the -toga- is nothing but a fuller —himation—. Even as regards weapons of war, liable as they are to frequent change, the two peoples have this much at least in common, that their two principal weapons of attack were the javelin and the bow,—a fact which is clearly expressed, as far as Rome is concerned, in the earliest names for warriors (-pilumni—arquites-),(8) and is in keeping with the oldest mode of fighting which was not properly adapted to a close struggle. Thus, in the language and manners of Greeks and Italians, all that relates to the material foundations of human existence may be traced back to the same primary elements; the oldest problems which the world proposes to man had been jointly solved by the two peoples at a time when they still formed one nation.

Difference of the Italian and the Greek Character

It was otherwise in the mental domain. The great problem of man—how to live in conscious harmony with himself, with his neighbour, and with the whole to which he belongs—admits of as many solutions as there are provinces in our Father’s kingdom; and it is in this, and not in the material sphere, that individuals and nations display their divergences of character. The exciting causes which gave rise to this intrinsic contrast must have been in the Graeco-Italian period as yet wanting; it was not until the Hellenes and Italians had separated that that deep-seated diversity of mental character became manifest, the effects of which continue to the present day. The family and the state, religion and art, received in Italy and in Greece respectively a development so peculiar and so thoroughly national, that the common basis, on which in these respects also the two peoples rested, has been so overgrown as to be almost concealed from our view. That Hellenic character, which sacrificed the whole to its individual elements, the nation to the township, and the township to the citizen; which sought its ideal of life in the beautiful and the good, and, but too often, in the enjoyment of idleness; which attained its political development by intensifying the original individuality of the several cantons, and at length produced the internal dissolution of even local authority; which in its view of religion first invested the gods with human attributes, and then denied their existence;

Page 24

which allowed full play to the limbs in the sports of the naked youth, and gave free scope to thought in all its grandeur and in all its awfulness;—and that Roman character, which solemnly bound the son to reverence the father, the citizen to reverence the ruler, and all to reverence the gods; which required nothing and honoured nothing but the useful act, and compelled every citizen to fill up every moment of his brief life with unceasing work; which made it a duty even in the boy modestly to cover the body; which deemed every one a bad citizen who wished to be different from his fellows; which regarded the state as all in all, and a desire for the state's extension as the only aspiration not liable to censure,—who can in thought trace back these sharply-marked contrasts to that original unity which embraced them both, prepared the way for their development, and at length produced them? It would be foolish presumption to desire to lift this veil; we shall only endeavour to indicate in brief outline the beginnings of Italian nationality and its connections with an earlier period—to direct the guesses of the discerning reader rather than to express them.

The Family and the State

All that may be called the patriarchal element in the state rested in Greece and Italy on the same foundations. Under this head comes especially the moral and decorous arrangement of social life,(9) which enjoined monogamy on the husband and visited with heavy penalties the infidelity of the wife, and which recognized the equality of the sexes and the sanctity of marriage in the high position which it assigned to the mother within the domestic circle. On the other hand the rigorous development of the marital and still more of the paternal authority, regardless of the natural rights of persons as such, was a feature foreign to the Greeks and peculiarly Italian; it was in Italy alone that moral subjection became transformed into legal slavery. In the same way the principle of the slave being completely destitute of legal rights—a principle involved in the very nature of slavery—was maintained by the Romans with merciless rigour and carried out to all its consequences; whereas among the Greeks alleviations of its harshness were early introduced both in practice and in legislation, the marriage of slaves, for example, being recognized as a legal relation.

On the household was based the clan, that is, the community of the descendants of the same progenitor; and out of the clan among the Greeks as well as the Italians arose the state. But while under the weaker political development of Greece the clan-bond maintained itself as a corporate power in contradistinction to that of the state far even into historical times, the state in Italy made its appearance at once complete, in so far as in presence of its authority the clans were quite neutralized and it exhibited an association not of clans, but of citizens. Conversely, again,

Page 25

the individual attained, in presence of the clan, an inward independence and freedom of personal development far earlier and more completely in Greece than in Rome—a fact reflected with great clearness in the Greek and Roman proper names, which, originally similar, came to assume very different forms. In the more ancient Greek names the name of the clan was very frequently added in an adjective form to that of the individual; while, conversely, Roman scholars were aware that their ancestors bore originally only one name, the later -praenomen-. But while in Greece the adjectival clan-name early disappeared, it became, among the Italians generally and not merely among the Romans, the principal name; and the distinctive individual name, the -praenomen-, became subordinate. It seems as if the small and ever diminishing number and the meaningless character of the Italian, and particularly of the Roman, individual names, compared with the luxuriant and poetical fulness of those of the Greeks, were intended to illustrate the truth that it was characteristic of the one nation to reduce all to a level, of the other to promote the free development of personality. The association in communities of families under patriarchal chiefs, which we may conceive to have prevailed in the Graeco-Italian period, may appear different enough from the later forms of Italian and Hellenic polities; yet it must have already contained the germs out of which the future laws of both nations were moulded. The “laws of king Italus,” which were still applied in the time of Aristotle, may denote the institutions essentially common to both. These laws must have provided for the maintenance of peace and the execution of justice within the community, for military organization and martial law in reference to its external relations, for its government by a patriarchal chief, for a council of elders, for assemblies of the freemen capable of bearing arms, and for some sort of constitution. Judicial procedure (-crimen-, —krinein—, expiation (-poena-, —poinei—), retaliation (-talio-, —talao—, —tleinai—, are Graeco-Italian ideas. The stern law of debt, by which the debtor was directly responsible with his person for the repayment of what he had received, is common to the Italians, for example, with the Tarentine Heracleots. The fundamental ideas of the Roman constitution—a king, a senate, and an assembly entitled simply to ratify or to reject the proposals which the king and senate should submit to it—are scarcely anywhere expressed so distinctly as in Aristotle’s account of the earlier constitution of Crete. The germs of larger state-confederacies in the political fraternizing or even amalgamation of several previously independent stocks (symmachy, synoikismos) are in like manner common to both nations. The more stress is to be laid on this fact of the common foundations of Hellenic and Italian polity, that it is not found to extend to the other Indo-Germanic stocks; the organization of the Germanic community, for example, by no means starts, like that of the Greeks and Romans, from an elective monarchy. But how different the polities were that were constructed on this common basis in Italy and Greece, and how completely the whole course of their political development belongs to each as its distinctive property,(10) it will be the business of the sequel to show.

Page 26

Religion

It is the same in religion. In Italy, as in Hellas, there lies at the foundation of the popular faith the same common treasure of symbolic and allegorical views of nature: on this rests that general analogy between the Roman and the Greek world of gods and of spirits, which was to become of so much importance in later stages of development. In many of their particular conceptions also,—in the already mentioned forms of Zeus-Diovis and Hestia-Vesta, in the idea of the holy space (—temenos—, -templum-), in various offerings and ceremonies—the two modes of worship do not by mere accident coincide. Yet in Hellas, as in Italy, they assumed a shape so thoroughly national and peculiar, that but little even of the ancient common inheritance was preserved in a recognizable form, and that little was for the most part misunderstood or not understood at all. It could not be otherwise; for, just as in the peoples themselves the great contrasts, which during the Graeco-Italian period had lain side by side undeveloped, were after their division distinctly evolved, so in their religion also a separation took place between the idea and the image, which had hitherto been but one whole in the soul. Those old tillers of the ground, when the clouds were driving along the sky, probably expressed to themselves the phenomenon by saying that the hound of the gods was driving together the startled cows of the herd. The Greek forgot that the cows were really the clouds, and converted the son of the hound of the gods—a form devised merely for the particular purposes of that conception—into the adroit messenger of the gods ready for every service. When the thunder rolled among the mountains, he saw Zeus brandishing his bolts on Olympus; when the blue sky again smiled upon him, he gazed into the bright eye of Athenaëa, the daughter of Zeus; and so powerful over him was the influence of the forms which he had thus created, that he soon saw nothing in them but human beings invested and illumined with the splendour of nature's power, and freely formed and transformed them according to the laws of beauty. It was in another fashion, but not less strongly, that the deeply implanted religious feeling of the Italian race manifested itself; it held firmly by the idea and did not suffer the form to obscure it. As the Greek, when he sacrificed, raised his eyes to heaven, so the Roman veiled his head; for the prayer of the former was contemplation, that of the latter reflection. Throughout the whole of nature he adored the spiritual and the universal. To everything existing, to the man and to the tree, to the state and to the store-room, was assigned a spirit which came into being with it and perished along with it, the counterpart of the natural phenomenon in the spiritual domain; to the man the male Genius, to the woman the female Juno, to the boundary Terminus, to the forest Silvanus, to the circling year Vertumnus, and so on to every

Page 27

object after its kind. In occupations the very steps of the process were spiritualized: thus, for example, in the prayer for the husbandman there was invoked the spirit of fallowing, of ploughing, of furrowing, sowing, covering-in, harrowing, and so forth down to that of the in-bringing, up-storing, and opening of the granaries. In like manner marriage, birth, and every other natural event were endowed with a sacred life. The larger the sphere embraced in the abstraction, the higher rose the god and the reverence paid by man. Thus Jupiter and Juno are the abstractions of manhood and womanhood; Dea Dia or Ceres, the creative power; Minerva, the power of memory; Dea Bona, or among the Samnites Dea Cupra, the good deity. While to the Greek everything assumed a concrete and corporeal shape, the Roman could only make use of abstract, completely transparent formulae; and while the Greek for the most part threw aside the old legendary treasures of primitive times, because they embodied the idea in too transparent a form, the Roman could still less retain them, because the sacred conceptions seemed to him dimmed even by the lightest veil of allegory. Not a trace has been preserved among the Romans even of the oldest and most generally diffused myths, such as that current among the Indians, the Greeks, and even the Semites, regarding a great flood and its survivor, the common ancestor of the present human race. Their gods could not marry and beget children, like those of the Hellenes; they did not walk about unseen among mortals; and they needed no nectar. But that they, nevertheless, in their spirituality—which only appears tame to dull apprehension—gained a powerful hold on men's minds, a hold more powerful perhaps than that of the gods of Hellas created after the image of man, would be attested, even if history were silent on the subject, by the Roman designation of faith (the word and the idea alike foreign to the Hellenes), -Religio-, that is to say, "that which binds." As India and Iran developed from one and the same inherited store, the former, the richly varied forms of its sacred epics, the latter, the abstractions of the Zend-Avesta; so in the Greek mythology the person is predominant, in the Roman the idea, in the former freedom, in the latter necessity.

Art

Lastly, what holds good of real life is true also of its counterfeit in jest and play, which everywhere, and especially in the earliest period of full and simple existence, do not exclude the serious, but veil it. The simplest elements of art are in Latium and Hellas quite the same; the decorous armed dance, the "leap" (-trionpus-, —thriambos—, —di-thyrambos—); the masquerade of the "full people" (—satyroi—, -satura-), who, wrapped in the skins of sheep and goats, wound up the festival with their jokes; lastly, the pipe, which with suitable strains accompanied and regulated the solemn as well as the merry dance.

Page 28

Nowhere, perhaps, does the especially close relationship of the Hellenes and Italians come to light so clearly as here; and yet in no other direction did the two nations manifest greater divergence as they became developed. The training of youth remained in Latium strictly confined to the narrow limits of domestic education; in Greece the yearning after a varied yet harmonious training of mind and body created the sciences of Gymnastics and Paideia, which were cherished by the nation and by individuals as their highest good. Latium in the poverty of its artistic development stands almost on a level with uncivilized peoples; Hellas developed with incredible rapidity out of its religious conceptions the myth and the worshipped idol, and out of these that marvellous world of poetry and sculpture, the like of which history has not again to show. In Latium no other influences were powerful in public and private life but prudence, riches, and strength; it was reserved for the Hellenes to feel the blissful ascendancy of beauty, to minister to the fair boy-friend with an enthusiasm half sensuous, half ideal, and to reanimate their lost courage with the war-songs of the divine singer.

Thus the two nations in which the civilization of antiquity culminated stand side by side, as different in development as they were in origin identical. The points in which the Hellenes excel the Italians are more universally intelligible and reflect a more brilliant lustre; but the deep feeling in each individual that he was only a part of the community, a rare devotedness and power of self-sacrifice for the common weal, an earnest faith in its own gods, form the rich treasure of the Italian nation. Both nations underwent a one-sided, and therefore each a complete, development; it is only a pitiful narrow-mindedness that will object to the Athenian that he did not know how to mould his state like the Fabii and the Valerii, or to the Roman that he did not learn to carve like Pheidias and to write like Aristophanes. It was in fact the most peculiar and the best feature in the character of the Greek people, that rendered it impossible for them to advance from national to political unity without at the same time exchanging their polity for despotism. The ideal world of beauty was all in all to the Greeks, and compensated them to some extent for what they wanted in reality. Wherever in Hellas a tendency towards national union appeared, it was based not on elements directly political, but on games and art: the contests at Olympia, the poems of Homer, the tragedies of Euripides, were the only bonds that held Hellas together. Resolutely, on the other hand, the Italian surrendered his own personal will for the sake of freedom, and learned to obey his father that he might know how to obey the state. Amidst this subjection individual development might be marred, and the germs of fairest promise in man might be arrested in the bud; the Italian gained in their stead a feeling of fatherland and of patriotism such as the Greek never knew, and alone among all the civilized nations of antiquity succeeded in working out national unity in connection with a constitution based on self-government—a national unity, which at last placed in his hands the mastery not only over the divided Hellenic stock, but over the whole known world.

Page 29

Notes for Book I Chapter II

1. Some of the epitaphs may give us an idea of its sound; as -theotoras artahiaihi bennarrihino- and -dasiihonas platorrihi bollihi-.
2. The hypothesis has been put forward of an affinity between the lapygian language and the modern Albanian; based, however, on points of linguistic comparison that are but little satisfactory in any case, and least of all where a fact of such importance is involved. Should this relationship be confirmed, and should the Albanians on the other hand—a race also Indo-Germanic and on a par with the Hellenic and Italian races—be really a remnant of that Hellene-barbaric nationality traces of which occur throughout all Greece and especially in the northern provinces, the nation that preceded the Hellenes would be demonstrated as identical with that which preceded the Italians. Still the inference would not immediately follow that the lapygian immigration to Italy had taken place across the Adriatic Sea.
3. Barley, wheat, and spelt were found growing together in a wild state on the right bank of the Euphrates, north-west from Anah (Alph. de Candolle, *Geographie botanique raisonnee*, ii. p. 934). The growth of barley and wheat in a wild state in Mesopotamia had already been mentioned by the Babylonian historian Berosus (ap. Georg. Syncell. p. 50 Bonn.).
4. Scotch -quern-. Mr. Robertson.
5. If the Latin -vieu-, -vimen-, belong to the same root as our weave (German -weben-) and kindred words, the word must still, when the Greeks and Italians separated, have had the general meaning “to plait,” and it cannot have been until a later period, and probably in different regions independently of each other, that it assumed that of “weaving.” The cultivation of flax, old as it is, does not reach back to this period, for the Indians, though well acquainted with the flax-plant, up to the present day use it only for the preparation of linseed-oil. Hemp probably became known to the Italians at a still later period than flax; at least -cannabis-looks quite like a borrowed word of later date.
6. Thus -aro-, -aratrum- reappear in the old German -aran-(to plough, dialectically -eren-), -erida-, in Slavonian -orati-, -oradlo-, in Lithuanian -arti-, -arimnas-, in Celtic -ar-, -aradar-. Thus alongside of -ligo- stands our rake (German -rechen-), of -hortus- our garden (German -garten-), of -mola- our mill (German -muhle-, Slavonic -mlyn-, Lithuanian -malunas-, Celtic -malin-).

With all these facts before us, we cannot allow that there ever was a time when the Greeks in all Hellenic cantons subsisted by purely pastoral husbandry. If it was the possession of cattle, and not of land, which in Greece as in Italy formed the basis and the standard of all private property, the reason of this was not that agriculture was of

later introduction, but that it was at first conducted on the system of joint possession. Of course a purely agricultural economy cannot have existed anywhere before the separation of the stocks; on the contrary, pastoral husbandry was (more or less according to locality) combined with it to an extent relatively greater than was the case in later times.

Page 30

7. Nothing is more significant in this respect than the close connection of agriculture with marriage and the foundation of cities during the earliest epoch of culture. Thus the gods in Italy immediately concerned with marriage are Ceres and (or?) Tellus (Plutarch, *Romul.* 22; Servius on *Aen.* iv. 166; Roszbach, *Rom. Ehe*, 257, 301), in Greece Demeter (Plutarch, *Conjug. Praec.* init.); in old Greek formulas the procreation of children is called —arotos—(ii. *The Family and the State*, note); indeed the oldest Roman form of marriage, -confarreatio-, derives its name and its ceremony from the cultivation of corn. The use of the plough in the founding of cities is well known.

8. Among the oldest names of weapons on both sides scarcely any can be shown to be certainly related; -lancea-, although doubtless connected with -logchei-, is, as a Roman word, recent, and perhaps borrowed from the Germans or Spaniards.

9. Even in details this agreement appears; e.g., in the designation of lawful wedlock as “marriage concluded for the obtaining of lawful children” (—gaucos epi paidon gneision aroto—, -matrimonium liberorum quaerendorum causa-).

10. Only we must, of course, not forget that like pre-existing conditions lead everywhere to like institutions. For instance, nothing is more certain than that the Roman plebeians were a growth originating within the Roman commonwealth, and yet they everywhere find their counterpart where a body of -metoeci- has arisen alongside of a body of burgesses. As a matter of course, chance also plays in such cases its provoking game.

CHAPTER III

The Settlements of the Latins

Indo-Germanic Migrations

The home of the Indo-Germanic stock lay in the western portion of central Asia; from this it spread partly in a south-eastern direction over India, partly in a northwestern over Europe. It is difficult to determine the primitive seat of the Indo-Germans more precisely: it must, however, at any rate have been inland and remote from the sea, as there is no name for the sea common to the Asiatic and European branches. Many indications point more particularly to the regions of the Euphrates; so that, singularly enough, the primitive seats of the two most important civilized stocks, —the Indo-Germanic and the Aramaean,—almost coincide as regards locality. This circumstance gives support to the hypothesis that these races also were originally connected, although, if there was such a connection, it certainly must have been anterior to all traceable development of culture and language. We cannot define more exactly their original locality, nor are we able to accompany the individual stocks in the course of

their migrations. The European branch probably lingered in Persia and Armenia for some considerable time after the departure of the Indians; for, according

Page 31

to all appearance, that region has been the cradle of agriculture and of the culture of the vine. Barley, spelt, and wheat are indigenous in Mesopotamia, and the vine to the south of the Caucasus and of the Caspian Sea: there too the plum, the walnut, and others of the more easily transplanted fruit trees are native. It is worthy of notice that the name for the sea is common to most of the European stocks—Latins, Celts, Germans, and Slavonians; they must probably therefore before their separation have reached the coast of the Black Sea or of the Caspian. By what route from those regions the Italians reached the chain of the Alps, and where in particular they were settled while still united with the Hellenes alone, are questions that can only be answered when the problem is solved by what route—whether from Asia Minor or from the regions of the Danube—the Hellenes arrived in Greece. It may at all events be regarded as certain that the Italians, like the Indians, migrated into their peninsula from the north.(1)

The advance of the Umbro-Sabellian stock along the central mountain-ridge of Italy, in a direction from north to south, can still be clearly traced; indeed its last phases belong to purely historical times. Less is known regarding the route which the Latin migration followed. Probably it proceeded in a similar direction along the west coast, long, in all likelihood, before the first Sabellian stocks began to move. The stream only overflows the heights when the lower grounds are already occupied; and only through the supposition that there were Latin stocks already settled on the coast are we able to explain why the Sabellians should have contented themselves with the rougher mountain districts, from which they afterwards issued and intruded, wherever it was possible, between the Latin tribes.

Extension of the Latins in Italy

It is well known that a Latin stock inhabited the country from the left bank of the Tiber to the Volscian mountains; but these mountains themselves, which appear to have been neglected on occasion of the first immigration when the plains of Latium and Campania still lay open to the settlers, were, as the Volscian inscriptions show, occupied by a stock more nearly related to the Sabellians than to the Latins. On the other hand, Latins probably dwelt in Campania before the Greek and Samnite immigrations; for the Italian names Novla or Nola (newtown), Campani Capua, Volturnus (from -volvere-, like -luturna- from -iuvare-), Opsci (labourers), are demonstrably older than the Samnite invasion, and show that, at the time when Cumae was founded by the Greeks, an Italian and probably Latin stock, the Ausones, were in possession of Campania. The primitive inhabitants of the districts which the Lucani and Bruttii subsequently occupied, the Itali proper (inhabitants of the land of oxen), are associated by the best observers not with the Iapygian, but with

Page 32

the Italian stock; and there is nothing to hinder our regarding them as belonging to its Latin branch, although the Hellenizing of these districts which took place even before the commencement of the political development of Italy, and their subsequent inundation by Samnite hordes, have in this instance totally obliterated the traces of the older nationality. Very ancient legends bring the similarly extinct stock of the Siculi into relation with Rome. For instance, the earliest historian of Italy Antiochus of Syracuse tells us that a man named Sikelos came a fugitive from Rome to Morges king of Italia (i. e. the Bruttian peninsula). Such stories appear to be founded on the identity of race recognized by the narrators as subsisting between the Siculi (of whom there were some still in Italy in the time of Thucydides) and the Latins. The striking affinity of certain dialectic peculiarities of Sicilian Greek with the Latin is probably to be explained rather by the old commercial connections subsisting between Rome and the Sicilian Greeks, than by the ancient identity of the languages of the Siculi and the Romans. According to all indications, however, not only Latium, but probably also the Campanian and Lucanian districts, the Italia proper between the gulfs of Tarentum and Laus, and the eastern half of Sicily were in primitive times inhabited by different branches of the Latin nation.

Destinies very dissimilar awaited these different branches. Those settled in Sicily, Magna Graecia, and Campania came into contact with the Greeks at a period when they were unable to offer resistance to their civilization, and were either completely Hellenized, as in the case of Sicily, or at any rate so weakened that they succumbed without marked resistance to the fresh energy of the Sabine tribes. In this way the Siculi, the Itali and Morgetes, and the Ausonians never came to play an active part in the history of the peninsula. It was otherwise with Latium, where no Greek colonies were founded, and the inhabitants after hard struggles were successful in maintaining their ground against the Sabines as well as against their northern neighbours. Let us cast a glance at this district, which was destined more than any other to influence the fortunes of the ancient world.

Latium

The plain of Latium must have been in primeval times the scene of the grandest conflicts of nature, while the slowly formative agency of water deposited, and the eruptions of mighty volcanoes upheaved, the successive strata of that soil on which was to be decided the question to what people the sovereignty of the world should belong. Latium is bounded on the east by the mountains of the Sabines and Aequi which form part of the Apennines; and on the south by the Volscian range rising to the height of 4000 feet, which is separated from the main chain of the Apennines by the ancient territory of the Hernici, the tableland of the Sacco

Page 33

(Tiberis, a tributary of the Liris), and stretching in a westerly direction terminates in the promontory of Terracina. On the west its boundary is the sea, which on this part of the coast forms but few and indifferent harbours. On the north it imperceptibly merges into the broad hill-land of Etruria. The region thus enclosed forms a magnificent plain traversed by the Tiber, the "mountain-stream" which issues from the Umbrian, and by the Anio, which rises in the Sabine mountains. Hills here and there emerge, like islands, from the plain; some of them steep limestone cliffs, such as that of Soracte in the north-east, and that of the Circeian promontory on the south-west, as well as the similar though lower height of the Janiculum near Rome; others volcanic elevations, whose extinct craters had become converted into lakes which in some cases still exist; the most important of these is the Alban range, which, free on every side, stands forth from the plain between the Volscian chain and the river Tiber.

Here settled the stock which is known to history under the name of the Latins, or, as they were subsequently called by way of distinction from the Latin communities beyond the bounds of Latium, the "Old Latins" (-prisci Latini-). But the territory occupied by them, the district of Latium, was only a small portion of the central plain of Italy. All the country north of the Tiber was to the Latins a foreign and even hostile domain, with whose inhabitants no lasting alliance, no public peace, was possible, and such armistices as were concluded appear always to have been for a limited period. The Tiber formed the northern boundary from early times; and neither in history nor in the more reliable traditions has any reminiscence been preserved as to the period or occasion of the establishment of a frontier line so important in its results. We find, at the time when our history begins, the flat and marshy tracts to the south of the Alban range in the hands of Umbro-Sabellian stocks, the Rutuli and Volsci; Ardea and Velitrae are no longer in the number of originally Latin towns. Only the central portion of that region between the Tiber, the spurs of the Apennines, the Alban Mount, and the sea—a district of about 700 square miles, not much larger than the present canton of Zurich—was Latium proper, the "plain,"(2) as it appears to the eye of the observer from the heights of Monte Cavo. Though the country is a plain, it is not monotonously flat. With the exception of the sea-beach which is sandy and formed in part by the accumulations of the Tiber, the level is everywhere broken by hills of tufa moderate in height though often somewhat steep, and by deep fissures of the ground. These alternating elevations and depressions of the surface lead to the formation of lakes in winter; and the exhalations proceeding in the heat of summer from the putrescent organic substances which they contain engender that noxious fever-laden atmosphere, which

Page 34

in ancient times tainted the district as it taints it at the present day. It is a mistake to suppose that these miasmata were first occasioned by the neglect of cultivation, which was the result of the misgovernment in the last century of the Republic and under the Papacy. Their cause lies rather in the want of natural outlets for the water; and it operates now as it operated thousands of years ago. It is true, however, that the malaria may to a certain extent be banished by thoroughness of tillage—a fact which has not yet received its full explanation, but may be partly accounted for by the circumstance that the working of the surface accelerates the drying up of the stagnant waters. It must always remain a remarkable phenomenon, that a dense agricultural population should have arisen in regions where no healthy population can at present subsist, and where the traveller is unwilling to tarry even for a single night, such as the plain of Latium and the lowlands of Sybaris and Metapontum. We must bear in mind that man in a low stage of civilization has generally a quicker perception of what nature demands, and a greater readiness in conforming to her requirements; perhaps, also, a more elastic physical constitution, which accommodates itself more readily to the conditions of the soil where he dwells. In Sardinia agriculture is prosecuted under physical conditions precisely similar even at the present day; the pestilential atmosphere exists, but the peasant avoids its injurious effects by caution in reference to clothing, food, and the choice of his hours of labour. In fact, nothing is so certain a protection against the “aria cattiva” as wearing the fleece of animals and keeping a blazing fire; which explains why the Roman countryman went constantly clothed in heavy woollen stuffs, and never allowed the fire on his hearth to be extinguished. In other respects the district must have appeared attractive to an immigrant agricultural people: the soil is easily laboured with mattock and hoe and is productive even without being manured, although, tried by an Italian standard, it does not yield any extraordinary return: wheat yields on an average about five-fold.⁽³⁾ Good water is not abundant; the higher and more sacred on that account was the esteem in which every fresh spring was held by the inhabitants.

Latin Settlements

No accounts have been preserved of the mode in which the settlements of the Latins took place in the district which has since borne their name; and we are left to gather what we can almost exclusively from a posteriori inference regarding them. Some knowledge may, however, in this way be gained, or at any rate some conjectures that wear an aspect of probability.

Clan-Villages

Page 35

The Roman territory was divided in the earliest times into a number of clan-districts, which were subsequently employed in the formation of the earliest “rural wards” (-tribus rusticae-). Tradition informs us as to the -tribus Claudia-, that it originated from the settlement of the Claudian clansmen on the Anio; and that the other districts of the earliest division originated in a similar manner is indicated quite as certainly by their names. These names are not, like those of the districts added at a later period, derived from the localities, but are formed without exception from the names of clans; and the clans who thus gave their names to the wards of the original Roman territory are, so far as they have not become entirely extinct (as is the case with the -Camilii-, -Galerii-, -Lemonii-, -Pollii-, -Pupinii-, -Voltinii-), the very oldest patrician families of Rome, the -Aemilii-, -Cornelii-, -Fabii-, -Horatii-, -Menenii-, -Papirii-, -Romilii-, -Sergii-, -Voturii-. It is worthy of remark, that not one of these clans can be shown to have taken up its settlement in Rome only at a later epoch. Every Italian, and doubtless also every Hellenic, canton must, like the Roman, have been divided into a number of groups associated at once by locality and by clanship; such a clan-settlement is the “house” (—oikia—) of the Greeks, from which very frequently the —komai— and —demoi— originated among them, like the tribus in Rome. The corresponding Italian terms “house” -vicus-or “district” (-pagus-, from -pangere-) indicate, in like manner, the joint settlement of the members of a clan, and thence come by an easily understood transition to signify in common use hamlet or village. As each household had its own portion of land, so the clan-household or village had a clan-land belonging to it, which, as will afterwards be shown, was managed up to a comparatively late period after the analogy of household—land, that is, on the system of joint-possession. Whether it was in Latium itself that the clan-households became developed into clan-villages, or whether the Latins were already associated in clans when they immigrated into Latium, are questions which we are just as little able to answer as we are to determine what was the form assumed by the management on joint account, which such an arrangement required,(4) or how far, in addition to the original ground of common ancestry, the clan may have been based on the incorporation or co-ordination from without of individuals not related to it by blood.

Cantons

These clanships, however, were from the beginning regarded not as independent societies, but as the integral parts of a political community (-civitas-, -populus-). This first presents itself as an aggregate of a number of clan-villages of the same stock, language, and manners, bound to mutual observance of law and mutual legal redress and to united action in aggression and defence. A fixed local centre

Page 36

was quite as necessary in the case of such a canton as in that of a clanship; but as the members of the clan, or in other words the constituent elements of the canton, dwelt in their villages, the centre of the canton cannot have been a place of joint settlement in the strict sense—a town. It must, on the contrary, have been simply a place of common assembly, containing the seat of justice and the common sanctuary of the canton, where the members of the canton met every eighth day for purposes of intercourse and amusement, and where, in case of war, they obtained for themselves and their cattle a safer shelter from the invading enemy than in the villages: in ordinary circumstances this place of meeting was not at all or but scantily inhabited. Ancient places of refuge, of a kind quite similar, may still be recognized at the present day on the tops of several of the hills in the highlands of east Switzerland. Such a place was called in Italy “height” (-capitolium-, like —akra—, the mountain-top), or “stronghold” (-arx-, from -arcere-); it was not a town at first, but it became the nucleus of one, as houses naturally gathered round the stronghold and were afterwards surrounded with the “ring” (-urbs-, connected with -urvus-, -rurvus-, perhaps also with -orbis-). The stronghold and town were visibly distinguished from each other by the number of gates, of which the stronghold has as few as possible, and the town many, the former ordinarily but one, the latter at least three. Such fortresses were the bases of that cantonal constitution which prevailed in Italy anterior to the existence of towns: a constitution, the nature of which may still be recognized with some degree of clearness in those provinces of Italy which did not until a late period reach, and in some cases have not yet fully reached, the stage of aggregation in towns, such as the land of the Marsi and the small cantons of the Abruzzi. The country of the Aequiculi, who even in the imperial period dwelt not in towns, but in numerous open hamlets, presents a number of ancient ring-walls, which, regarded as “deserted towns” with their solitary temples, excited the astonishment of the Roman as well as of modern archaeologists, who have fancied that they could find accommodation there, the former for their “primitive inhabitants” (-aborigines-), the latter for their Pelasgians. We shall certainly be nearer the truth in recognizing these structures not as walled towns, but as places of refuge for the inhabitants of the district, such as were doubtless found in more ancient times over all Italy, although constructed in less artistic style. It was natural that at the period when the stocks that had made the transition to urban life were surrounding their towns with stone walls, those districts whose inhabitants continued to dwell in open hamlets should replace the earthen ramparts and palisades of their strongholds with buildings of stone. When peace came to be securely established throughout the land and such fortresses were no longer needed, these places of refuge were abandoned and soon became a riddle to after generations.

Page 37

Localities of the Oldest Cantons

These cantons accordingly, having their rendezvous in some stronghold, and including a certain number of clanships, form the primitive political unities with which Italian history begins. At what period, and to what extent, such cantons were formed in Latium, cannot be determined with precision; nor is it a matter of special historical interest. The isolated Alban range, that natural stronghold of Latium, which offered to settlers the most wholesome air, the freshest springs, and the most secure position, would doubtless be first occupied by the new comers.

Alba

Here accordingly, along the narrow plateau above Palazzuola, between the Alban lake (-Lago di Castello-) and the Alban mount (-Monte Cavo-), extended the town of Alba, which was universally regarded as the primitive seat of the Latin stock, and the mother-city of Rome as well as of all the other Old Latin communities; here, too, on the slopes lay the very ancient Latin canton-centres of Lanuvium, Aricia, and Tusculum. Here are found some of those primitive works of masonry, which usually mark the beginnings of civilization and seem to stand as a witness to posterity that in reality Pallas Athena when she does appear, comes into the world full grown. Such is the escarpment of the wall of rock below Alba in the direction of Palazzuola, whereby the place, which is rendered naturally inaccessible by the steep declivities of Monte Cavo on the south, is rendered equally unapproachable on the north, and only the two narrow approaches on the east and west, which are capable of being easily defended, are left open for traffic. Such, above all, is the large subterranean tunnel cut—so that a man can stand upright within it—through the hard wall of lava, 6000 feet thick, by which the waters of the lake formed in the old crater of the Alban Mount were reduced to their present level and a considerable space was gained for tillage on the mountain itself.

The summits of the last offshoots of the Sabine range form natural fastnesses of the Latin plain; and the canton-strongholds there gave rise at a later period to the considerable towns of Tibur and Praeneste. Labici too, Gabii, and Nomentum in the plain between the Alban and Sabine hills and the Tiber, Rome on the Tiber, Laurentum and Lavinium on the coast, were all more or less ancient centres of Latin colonization, not to speak of many others less famous and in some cases almost forgotten.

The Latin League

Page 38

All these cantons were in primitive times politically sovereign, and each of them was governed by its prince with the co-operation of the council of elders and the assembly of warriors. Nevertheless the feeling of fellowship based on community of descent and of language not only pervaded the whole of them, but manifested itself in an important religious and political institution—the perpetual league of the collective Latin cantons. The presidency belonged originally, according to the universal Italian as well as Hellenic usage, to that canton within whose bounds lay the meeting-place of the league; in this case it was the canton of Alba, which, as we have said, was generally regarded as the oldest and most eminent of the Latin cantons. The communities entitled to participate in the league were in the beginning thirty—a number which we find occurring with singular frequency as the sum of the constituent parts of a commonwealth in Greece and Italy. What cantons originally made up the number of the thirty old Latin communities or, as with reference to the metropolitan rights of Alba they are also called, the thirty Alban colonies, tradition has not recorded, and we can no longer ascertain. The rendezvous of this union was, like the Pamboeotia and the Panionia among the similar confederacies of the Greeks, the “Latin festival” (-feriae Latinae-), at which, on the “Mount of Alba” (-Mons Albanus-, -Monte Cavo-), upon a day annually appointed by the chief magistrate for the purpose, an ox was offered in sacrifice by the assembled Latin stock to the “Latin god” (-Jupiter Latiaris-). Each community taking part in the ceremony had to contribute to the sacrificial feast its fixed proportion of cattle, milk, and cheese, and to receive in return a portion of the roasted victim. These usages continued down to a late period, and are well known: respecting the more important legal bearings of this association we can do little else than institute conjectures.

From the most ancient times there were held, in connection with the religious festival on the Mount of Alba, assemblies of the representatives of the several communities at the neighbouring Latin seat of justice at the source of the Ferentina (near Marino). Indeed such a confederacy cannot be conceived to exist without having a certain power of superintendence over the associated body, and without possessing a system of law binding on all. Tradition records, and we may well believe, that the league exercised jurisdiction in reference to violations of federal law, and that it could in such cases pronounce even sentence of death. The later communion of legal rights and, in some sense, of marriage that subsisted among the Latin communities may perhaps be regarded as an integral part of the primitive law of the league, so that any Latin man could beget lawful children with any Latin woman and acquire landed property and carry on trade in any part of Latium. The league may have also provided

Page 39

a federal tribunal of arbitration for the mutual disputes of the cantons; on the other hand, there is no proof that the league imposed any limitation on the sovereign right of each community to make peace or war. In like manner there can be no doubt that the constitution of the league implied the possibility of its waging defensive or even aggressive war in its own name; in which case, of course, it would be necessary to have a federal commander-in-chief. But we have no reason to suppose that in such an event each community was compelled by law to furnish a contingent for the army, or that, conversely, any one was interdicted from undertaking a war on its own account even against a member of the league. There are, however, indications that during the Latin festival, just as was the case during the festivals of the Hellenic leagues, "a truce of God" was observed throughout all Latium;(5) and probably on that occasion even tribes at feud granted safe-conducts to each other.

It is still less in our power to define the range of the privileges of the presiding canton; only we may safely affirm that there is no reason for recognizing in the Alban presidency a real political hegemony over Latium, and that possibly, nay probably, it had no more significance in Latium than the honorary presidency of Elis had in Greece.(6) On the whole it is probable that the extent of this Latin league, and the amount of its jurisdiction, were somewhat unsettled and fluctuating; yet it remained throughout not an accidental aggregate of various communities more or less alien to each other, but the just and necessary expression of the relationship of the Latin stock. The Latin league may not have at all times included all Latin communities, but it never at any rate granted the privilege of membership to any that were not Latin. Its counterpart in Greece was not the Delphic Amphictyony, but the Boeotian or Aetolian confederacy.

These very general outlines must suffice: any attempt to draw the lines more sharply would only falsify the picture. The manifold play of mutual attraction and repulsion among those earliest political atoms, the cantons, passed away in Latium without witnesses competent to tell the tale. We must now be content to realise the one great abiding fact that they possessed a common centre, to which they did not sacrifice their individual independence, but by means of which they cherished and increased the feeling of their belonging collectively to the same nation. By such a common possession the way was prepared for their advance from that cantonal individuality, with which the history of every people necessarily begins, to the national union with which the history of every people ends or at any rate ought to end.

Notes for Book I Chapter III

1. I. II. Italians

2. Like -latus- (side) and —platus— (flat); it denotes therefore the flat country in contrast to the Sabine mountain-land, just as Campania, the “plain,” forms the contrast to Samnium. Latus, formerly -stlatus-, has no connection with Latium.

Page 40

3. A French statist, Dureau de la Malle (-Econ. Pol. des Romains-, ii. 226), compares with the Roman Campagna the district of Limagne in Auvergne, which is likewise a wide, much intersected, and uneven plain, with a superficial soil of decomposed lava and ashes—the remains of extinct volcanoes. The population, at least 2500 to the square league, is one of the densest to be found in purely agricultural districts: property is subdivided to an extraordinary extent. Tillage is carried on almost entirely by manual labour, with spade, hoe, or mattock; only in exceptional cases a light plough is substituted drawn by two cows, the wife of the peasant not unfrequently taking the place of one of them in the yoke. The team serves at once to furnish milk and to till the land. They have two harvests in the year, corn and vegetables; there is no fallow. The average yearly rent for an arpent of arable land is 100 francs. If instead of such an arrangement this same land were to be divided among six or seven large landholders, and a system of management by stewards and day labourers were to supersede the husbandry of the small proprietors, in a hundred years the Limagne would doubtless be as waste, forsaken, and miserable as the Campagna di Roma is at the present day.

4. In Slavonia, where the patriarchal economy is retained up to the present day, the whole family, often to the number of fifty or even a hundred persons, remains together in the same house under the orders of the house-father (Gospodar) chosen by the whole family for life. The property of the household, which consists chiefly in cattle, is administered by the house-father; the surplus is distributed according to the family-branches. Private acquisitions by industry and trade remain separate property. Instances of quitting the household occur, in the case even of men, e. g. by marrying into a stranger household (Csaplovies, -Slavonien-, i. 106, 179). —Under such circumstances, which are probably not very widely different from the earliest Roman conditions, the household approximates in character to the community.

5. The Latin festival is expressly called “armistice” (-indutiae-, Macrob. Sat. i. 16; — ekecheipiai—, Dionys. iv. 49); and a war was not allowed to be begun during its continuance (Macrob. l. c.)

6. The assertion often made in ancient and modern times, that Alba once ruled over Latium under the forms of a symmachy, nowhere finds on closer investigation sufficient support. All history begins not with the union, but with the disunion of a nation; and it is very improbable that the problem of the union of Latium, which Rome finally solved after some centuries of conflict, should have been already solved at an earlier period by Alba. It deserves to be remarked too that Rome never asserted in the capacity of heiress of Alba any claims of sovereignty proper over the Latin communities, but contented herself with an honorary presidency; which no doubt, when it became combined with material power, afforded a handle for her pretensions of hegemony. Testimonies, strictly so called, can scarcely be adduced on such a question; and least of all do such passages as Festus -v. praetor-, p. 241, and Dionys. iii. 10, suffice to stamp Alba as a Latin Athens.

Page 41

CHAPTER IV

The Beginnings of Rome

Ramnes

About fourteen miles up from the mouth of the river Tiber hills of moderate elevation rise on both banks of the stream, higher on the right, lower on the left bank. With the latter group there has been closely associated for at least two thousand five hundred years the name of the Romans. We are unable, of course, to tell how or when that name arose; this much only is certain, that in the oldest form of it known to us the inhabitants of the canton are called not Romans, but Ramnians (Ramnes); and this shifting of sound, which frequently occurs in the older period of a language, but fell very early into abeyance in Latin,(1) is an expressive testimony to the immemorial antiquity of the name. Its derivation cannot be given with certainty; possibly "Ramnes" may mean "the people on the stream."

Tities, Luceres

But they were not the only dwellers on the hills by the bank of the Tiber. In the earliest division of the burgesses of Rome a trace has been preserved of the fact that that body arose out of the amalgamation of three cantons once probably independent, the Ramnians, Tities, and Luceres, into a single commonwealth—in other words, out of such a —synoikismos— as that from which Athens arose in Attica.(2) The great antiquity of this threefold division of the community(3) is perhaps best evinced by the fact that the Romans, in matters especially of constitutional law, regularly used the forms -tribuere- ("to divide into three") and -tribus- ("a third") in the general sense of "to divide" and "a part," and the latter expression (-tribus-), like our "quarter," early lost its original signification of number. After the union each of these three communities—once separate, but now forming subdivisions of a single community—still possessed its third of the common domain, and had its proportional representation in the burgess-force and in the council of the elders. In ritual also, the number divisible by three of the members of almost all the oldest colleges—of the Vestal Virgins, the Salii, the Arval Brethren, the Luperci, the Augurs— probably had reference to that three-fold partition. These three elements into which the primitive body of burgesses in Rome was divided have had theories of the most extravagant absurdity engrafted upon them. The irrational opinion that the Roman nation was a mongrel people finds its support in that division, and its advocates have striven by various means to represent the three great Italian races as elements entering into the composition of the primitive Rome, and to transform a people which has exhibited in language, polity, and religion, a pure and national development

such as few have equalled, into a confused aggregate of Etruscan and Sabine, Hellenic and, forsooth! even Pelasgian fragments.

Page 42

Setting aside self-contradictory and unfounded hypotheses, we may sum up in a few words all that can be said respecting the nationality of the component elements of the primitive Roman commonwealth. That the Ramnians were a Latin stock cannot be doubted, for they gave their name to the new Roman commonwealth and therefore must have substantially determined the nationality of the united community. Respecting the origin of the Luceres nothing can be affirmed, except that there is no difficulty in the way of our assigning them, like the Ramnians, to the Latin stock. The second of these communities, on the other hand, is with one consent derived from Sabina; and this view can at least be traced to a tradition preserved in the Titian brotherhood, which represented that priestly college as having been instituted, on occasion of the Tities being admitted into the collective community, for the preservation of their distinctive Sabine ritual. It may be, therefore, that at a period very remote, when the Latin and Sabellian stocks were beyond question far less sharply contrasted in language, manners, and customs than were the Roman and the Samnite of a later age, a Sabellian community entered into a Latin canton-union; and, as in the older and more credible traditions without exception the Tities take precedence of the Ramnians, it is probable that the intruding Tities compelled the older Ramnians to accept the — synoikismos—. A mixture of different nationalities certainly therefore took place; but it hardly exercised an influence greater than the migration, for example, which occurred some centuries afterwards of the Sabine Attus Clauzus or Appius Claudius and his clansmen and clients to Rome. The earlier admission of the Tities among the Ramnians does not entitle us to class the community among mongrel peoples any more than does that subsequent reception of the Claudii among the Romans. With the exception, perhaps, of isolated national institutions handed down in connection with ritual, the existence of Sabellian elements can nowhere be pointed out in Rome; and the Latin language in particular furnishes absolutely no support to any such hypothesis.(4) It would in fact be more than surprising, if the Latin nation should have had its nationality in any sensible degree affected by the insertion of a single community from a stock so very closely related to it; and, besides, it must not be forgotten that at the time when the Tides settled beside the Ramnians, Latin nationality rested on Latium as its basis, and not on Rome. The new tripartite Roman commonwealth was, notwithstanding some incidental elements which were originally Sabellian, just what the community of the Ramnians had previously been—a portion of the Latin nation.

Rome the Emporium of Latium

Page 43

Long, in all probability, before an urban settlement arose on the Tiber, these Ramnians, Titians, and Luceres, at first separate, afterwards united, had their stronghold on the Roman hills, and tilled their fields from the surrounding villages. The “wolf-festival” (Lupercalia) which the gens of the Quinctii celebrated on the Palatine hill, was probably a tradition from these primitive times—a festival of husbandmen and shepherds, which more than any other preserved the homely pastimes of patriarchal simplicity, and, singularly enough, maintained itself longer than all the other heathen festivals in Christian Rome,

Character of Its Site

From these settlements the later Rome arose. The founding of a city in the strict sense, such as the legend assumes, is of course to be reckoned altogether out of the question: Rome was not built in a day. But the serious consideration of the historian may well be directed to the inquiry, in what way Rome can have so early attained the prominent political position which it held in Latium—so different from what the physical character of the locality would have led us to anticipate. The site of Rome is less healthy and less fertile than that of most of the old Latin towns. Neither the vine nor the fig succeed well in the immediate environs, and there is a want of springs yielding a good supply of water; for neither the otherwise excellent fountain of the Camenae before the Porta Capena, nor the Capitoline well, afterwards enclosed within the Tullianum, furnish it in any abundance. Another disadvantage arises from the frequency with which the river overflows its banks. Its very slight fall renders it unable to carry off the water, which during the rainy season descends in large quantities from the mountains, with sufficient rapidity to the sea, and in consequence it floods the low-lying lands and the valleys that open between the hills, and converts them into swamps. For a settler the locality was anything but attractive. In antiquity itself an opinion was expressed that the first body of immigrant cultivators could scarce have spontaneously resorted in search of a suitable settlement to that unhealthy and unfruitful spot in a region otherwise so highly favoured, and that it must have been necessity, or rather some special motive, which led to the establishment of a city there. Even the legend betrays its sense of the strangeness of the fact: the story of the foundation of Rome by refugees from Alba under the leadership of the sons of an Alban prince, Romulus and Remus, is nothing but a naive attempt of primitive quasi-history to explain the singular circumstance of the place having arisen on a site so unfavourable, and to connect at the same time the origin of Rome with the general metropolis of Latium. Such tales, which profess to be historical but are merely improvised explanations of no very ingenious character, it is the first duty of history to dismiss; but it may perhaps be allowed to go a step further, and after weighing the special relations of the locality to propose a positive conjecture not regarding the way in which the place originated, but regarding the circumstances which occasioned its rapid and surprising prosperity and led to its occupying its peculiar position in Latium.

Page 44

Earliest Limits of the Roman Territory

Let us notice first of all the earliest boundaries of the Roman territory. Towards the east the towns of Antemnae, Fidenae, Caenina, and Gabii lie in the immediate neighbourhood, some of them not five miles distant from the Servian ring-wall; and the boundary of the canton must have been in the close vicinity of the city gates. On the south we find at a distance of fourteen miles the powerful communities of Tusculum and Alba; and the Roman territory appears not to have extended in this direction beyond the -Fossa Cluilia-, five miles from Rome. In like manner, towards the south-west, the boundary betwixt Rome and Lavinium was at the sixth milestone. While in a landward direction the Roman canton was thus everywhere confined within the narrowest possible limits, from the earliest times, on the other hand, it extended without hindrance on both banks of the Tiber towards the sea. Between Rome and the coast there occurs no locality that is mentioned as an ancient canton-centre, and no trace of any ancient canton-boundary. The legend indeed, which has its definite explanation of the origin of everything, professes to tell us that the Roman possessions on the right bank of the Tiber, the “seven hamlets” (-septem pagi-), and the important salt-works at its mouth, were taken by king Romulus from the Veientes, and that king Ancus fortified on the right bank the -tete de pont-, the “mount of Janus” (-Janiculum-), and founded on the left the Roman Peiraeus, the seaport at the river’s “mouth” (-Ostia-). But in fact we have evidence more trustworthy than that of legend, that the possessions on the Etruscan bank of the Tiber must have belonged to the original territory of Rome; for in this very quarter, at the fourth milestone on the later road to the port, lay the grove of the creative goddess (-Dea Dia-), the primitive chief seat of the Arval festival and Arval brotherhood of Rome. Indeed from time immemorial the clan of the Romilii, once the chief probably of all the Roman clans, was settled in this very quarter; the Janiculum formed a part of the city itself, and Ostia was a burgess colony or, in other words, a suburb.

The Tiber and Its Traffic

This cannot have been the result of mere accident. The Tiber was the natural highway for the traffic of Latium; and its mouth, on a coast scantily provided with harbours, became necessarily the anchorage of seafarers. Moreover, the Tiber formed from very ancient times the frontier defence of the Latin stock against their northern neighbours. There was no place better fitted for an emporium of the Latin river and sea traffic, and for a maritime frontier fortress of Latium, than Rome. It combined the advantages of a strong position and of immediate vicinity to the river; it commanded both banks of the stream down to its mouth; it was so situated as to be equally

Page 45

convenient for the river navigator descending the Tiber or the Anio, and for the seafarer with vessels of so moderate a size as those which were then used; and it afforded greater protection from pirates than places situated immediately on the coast. That Rome was indebted, if not for its origin, at any rate for its importance, to these commercial and strategical advantages of its position, there are accordingly numerous further indications, which are of very different weight from the statements of quasi-historical romances. Thence arose its very ancient relations with Caere, which was to Etruria what Rome was to Latium, and accordingly became Rome's most intimate neighbour and commercial ally. Thence arose the unusual importance of the bridge over the Tiber, and of bridge-building generally in the Roman commonwealth. Thence came the galley in the city arms; thence, too, the very ancient Roman port-duties on the exports and imports of Ostia, which were from the first levied only on what was to be exposed for sale (-promercale-), not on what was for the shipper's own use (-usuarium-), and which were therefore in reality a tax upon commerce. Thence, to anticipate, the comparatively early occurrence in Rome of coined money, and of commercial treaties with transmarine states. In this sense, then, certainly Rome may have been, as the legend assumes, a creation rather than a growth, and the youngest rather than the oldest among the Latin cities. Beyond doubt the country was already in some degree cultivated, and the Alban range as well as various other heights of the Campagna were occupied by strongholds, when the Latin frontier emporium arose on the Tiber. Whether it was a resolution of the Latin confederacy, or the clear-sighted genius of some unknown founder, or the natural development of traffic, that called the city of Rome into being, it is vain even to surmise.

Early Urban Character of Rome

But in connection with this view of the position of Rome as the emporium of Latium another observation suggests itself. At the time when history begins to dawn on us, Rome appears, in contradistinction to the league of the Latin communities, as a compact urban unity. The Latin habit of dwelling in open villages, and of using the common stronghold only for festivals and assemblies or in case of special need, was subjected to restriction at a far earlier period, probably, in the canton of Rome than anywhere else in Latium. The Roman did not cease to manage his farm in person, or to regard it as his proper home; but the unwholesome atmosphere of the Campagna could not but induce him to take up his abode as much as possible on the more airy and salubrious city hills; and by the side of the cultivators of the soil there must have been a numerous non-agricultural population, partly foreigners, partly native, settled there from very early times. This to some extent accounts for the dense population of the old Roman territory,

Page 46

which may be estimated at the utmost at 115 square miles, partly of marshy or sandy soil, and which, even under the earliest constitution of the city, furnished a force of 3300 freemen; so that it must have numbered at least 10,000 free inhabitants. But further, every one acquainted with the Romans and their history is aware that it is their urban and mercantile character which forms the basis of whatever is peculiar in their public and private life, and that the distinction between them and the other Latins and Italians in general is pre-eminently the distinction between citizen and rustic. Rome, indeed, was not a mercantile city like Corinth or Carthage; for Latium was an essentially agricultural region, and Rome was in the first instance, and continued to be, pre-eminently a Latin city. But the distinction between Rome and the mass of the other Latin towns must certainly be traced back to its commercial position, and to the type of character produced by that position in its citizens. If Rome was the emporium of the Latin districts, we can readily understand how, along with and in addition to Latin husbandry, an urban life should have attained vigorous and rapid development there and thus have laid the foundation for its distinctive career.

It is far more important and more practicable to follow out the course of this mercantile and strategical growth of the city of Rome, than to attempt the useless task of chemically analysing the insignificant and but little diversified communities of primitive times. This urban development may still be so far recognized in the traditions regarding the successive circumvallations and fortifications of Rome, the formation of which necessarily kept pace with the growth of the Roman commonwealth in importance as a city.

The Palatine City

The town, which in the course of centuries grew up as Rome, in its original form embraced according to trustworthy testimony only the Palatine, or "square Rome" (-Roma quadrata-), as it was called in later times from the irregularly quadrangular form of the Palatine hill. The gates and walls that enclosed this original city remained visible down to the period of the empire: the sites of two of the former, the Porta Romana near S. Giorgio in Velabro, and the Porta Mugionis at the Arch of Titus, are still known to us, and the Palatine ring-wall is described by Tacitus from his own observation at least on the sides looking towards the Aventine and Caelian. Many traces indicate that this was the centre and original seat of the urban settlement. On the Palatine was to be found the sacred symbol of that settlement, the "outfit-vault" (-mundus-) as it was called, in which the first settlers deposited a sufficiency of everything necessary for a household and added a clod of their dear native earth. There, too, was situated the building in which all the curies assembled for religious and other purposes, each at its own hearth (-curiae veteres-).

Page 47

There stood the meetinghouse of the “Leapers” (-curia Saliorum-) in which also the sacred shields of Mars were preserved, the sanctuary of the “Wolves” (-Lupercal-), and the dwelling of the priest of Jupiter. On and near this hill the legend of the founding of the city placed the scenes of its leading incidents, and the straw-covered house of Romulus, the shepherd’s hut of his foster-father Faustulus, the sacred fig-tree towards which the cradle with the twins had floated, the cornelian cherry-tree that sprang from the shaft of the spear which the founder of the city had hurled from the Aventine over the valley of the Circus into this enclosure, and other such sacred relics were pointed out to the believer. Temples in the proper sense of the term were still at this time unknown, and accordingly the Palatine has nothing of that sort to show belonging to the primitive age. The public assemblies of the community were early transferred to another locality, so that their original site is unknown; only it may be conjectured that the free space round the -mundus-, afterwards called the -area Apollinis-, was the primitive place of assembly for the burgesses and the senate, and the stage erected over the -mundus- itself the primitive seat of justice of the Roman community.

The Seven Mounts

The “festival of the Seven Mounts” (-septimontium-), again, has preserved the memory of the more extended settlement which gradually formed round the Palatine. Suburbs grew up one after another, each protected by its own separate though weaker circumvallation and joined to the original ring-wall of the Palatine, as in fen districts the outer dikes are joined on to the main dike. The “Seven Rings” were, the Palatine itself; the Cermalus, the slope of the Palatine in the direction of the morass that extended between it and the Capitol towards the river (-velabrum-); the Velia, the ridge which connected the Palatine with the Esquiline, but in subsequent times was almost wholly obliterated by the buildings of the empire; the Fagutal, the Oppius, and the Cispius, the three summits of the Esquiline; lastly, the Sucusa, or Subura, a fortress constructed outside of the earthen rampart which protected the new town on the Carinae, in the depression between the Esquiline and the Quirinal beneath S. Pietro in Vincoli. These additions, manifestly the results of a gradual growth, clearly reveal to a certain extent the earliest history of the Palatine Rome, especially when we compare with them the Servian arrangement of districts which was afterwards formed on the basis of this earliest division.

Oldest Settlements in the Palatine and Suburan Regions

Page 48

The Palatine was the original seat of the Roman community, the oldest and originally the only ring-wall. The urban settlement, however, began at Rome as well as elsewhere not within, but under the protection of, the stronghold; and the oldest settlements with which we are acquainted, and which afterwards formed the first and second regions in the Servian division of the city, lay in a circle round the Palatine. These included the settlement on the declivity of the Cermalus with the “street of the Tuscans”—a name in which there may have been preserved a reminiscence of the commercial intercourse between the Caerites and Romans already perhaps carried on with vigour in the Palatine city—and the settlement on the Velia; both of which subsequently along with the stronghold-hill itself constituted one region in the Servian city. Further, there were the component elements of the subsequent second region—the suburb on the Caelian, which probably embraced only its extreme point above the Colosseum; that on the Carinae, the spur which projects from the Esquiline towards the Palatine; and, lastly, the valley and outwork of the Subura, from which the whole region received its name. These two regions jointly constituted the incipient city; and the Suburan district of it, which extended at the base of the stronghold, nearly from the Arch of Constantine to S. Pietro in Vincoli, and over the valley beneath, appears to have been more considerable and perhaps older than the settlements incorporated by the Servian arrangement in the Palatine district, because in the order of the regions the former takes precedence of the latter. A remarkable memorial of the distinction between these two portions of the city was preserved in one of the oldest sacred customs of the later Rome, the sacrifice of the October horse yearly offered in the -Campus Martius-: down to a late period a struggle took place at this festival for the horse’s head between the men of the Subura and those of the Via Sacra, and according as victory lay with the former or with the latter, the head was nailed either to the Mamilian Tower (site unknown) in the Subura, or to the king’s palace under the Palatine. It was the two halves of the old city that thus competed with each other on equal terms. At that time, accordingly, the Esquiliae (which name strictly used is exclusive of the Carinae) were in reality what they were called, the “outer buildings” (-exquiliae-, like -inquilinus-, from -colere-) or suburb: this became the third region in the later city division, and it was always held in inferior consideration as compared with the Suburan and Palatine regions. Other neighbouring heights also, such as the Capitol and the Aventine, may probably have been occupied by the community of the Seven Mounts; the “bridge of piles” in particular (-pons sublicius-), thrown over the natural pier of the island in the Tiber, must have existed even then—the pontifical college alone is sufficient evidence of this—and

Page 49

the -tete de pont- on the Etruscan bank, the height of the Janiculum, would not be left unoccupied; but the community had not as yet brought either within the circuit of its fortifications. The regulation which was adhered to as a ritual rule down to the latest times, that the bridge should be composed simply of wood without iron, manifestly shows that in its original practical use it was to be merely a flying bridge, which must be capable of being easily at any time broken off or burnt. We recognize in this circumstance how insecure for a long time and liable to interruption was the command of the passage of the river on the part of the Roman community.

No relation is discoverable between the urban settlements thus gradually formed and the three communities into which from an immemorially early period the Roman commonwealth was in political law divided. As the Ramnes, Tities, and Luceres appear to have been communities originally independent, they must have had their settlements originally apart; but they certainly did not dwell in separate circumvallations on the Seven Hills, and all fictions to this effect in ancient or modern times must be consigned by the intelligent inquirer to the same fate with the charming tale of Tarpeia and the battle of the Palatine. On the contrary each of the three tribes of Ramnes, Tities, and Luceres must have been distributed throughout the two regions of the oldest city, the Subura and Palatine, and the suburban region as well: with this may be connected the fact, that afterwards not only in the Suburan and Palatine, but in each of the regions subsequently added to the city, there were three pairs of Argean chapels. The Palatine city of the Seven Mounts may have had a history of its own; no other tradition of it has survived than simply that of its having once existed. But as the leaves of the forest make room for the new growth of spring, although they fall unseen by human eyes, so has this unknown city of the Seven Mounts made room for the Rome of history.

The Hill-Romans on the Quirinal

But the Palatine city was not the only one that in ancient times existed within the circle afterwards enclosed by the Servian walls; opposite to it, in its immediate vicinity, there lay a second city on the Quirinal. The "old stronghold" (-Capitolium vetus-) with a sanctuary of Jupiter, Juno, and Minerva, and a temple of the goddess of Fidelity in which state treaties were publicly deposited, forms the evident counterpart of the later Capitol with its temple to Jupiter, Juno, and Minerva, and with its shrine of Fides Romana likewise destined as it were for a repository of international law, and furnishes a sure proof that the Quirinal also was once the centre of an independent commonwealth. The same fact may be inferred from the double worship of Mars on the Palatine and the Quirinal; for Mars was the type of the warrior and the oldest chief divinity

Page 50

of the burgess communities of Italy. With this is connected the further circumstance that his ministers, the two primitive colleges of the “Leapers” (-Salii-) and of the “Wolves” (-Luperi-) existed in the later Rome in duplicate: by the side of the Salii of the Palatine there were also Salii of the Quirinal; by the side of the Quinctian Luperi of the Palatine there was a Fabian guild of Luperi, which in all probability had their sanctuary on the Quirinal.(5)

All these indications, which even in themselves are of great weight, become more significant when we recollect that the accurately known circuit of the Palatine city of the Seven Mounts excluded the Quirinal, and that afterwards in the Servian Rome, while the first three regions corresponded to the former Palatine city, a fourth region was formed out of the Quirinal along with the neighbouring Viminal. Thus, too, we discover an explanation of the reason why the strong outwork of the Subura was constructed beyond the city wall in the valley between the Esquiline and Quirinal; it was at that point, in fact, that the two territories came into contact, and the Palatine Romans, after having taken possession of the low ground, were under the necessity of constructing a stronghold for protection against those of the Quirinal.

Lastly, even the name has not been lost by which the men of the Quirinal distinguished themselves from their Palatine neighbours. As the Palatine city took the name of “the Seven Mounts,” its citizens called themselves the “mount-men” (-montani-), and the term “mount,” while applied to the other heights belonging to the city, was above all associated with the Palatine; so the Quirinal height—although not lower, but on the contrary somewhat higher, than the former—as well as the adjacent Viminal never in the strict use of the language received any other name than “hill” (collis). In the ritual records, indeed, the Quirinal was not unfrequently designated as the “hill” without further addition. In like manner the gate leading out from this height was usually called the “hill-gate” (-porta collina-); the priests of Mars settled there were called those “of the hill” (-Salii collini-) in contrast to those of the Palatium (-Salii Palatini-) and the fourth Servian region formed out of this district was termed the hill-region (-tribus collina-)(6) The name of Romans primarily associated with the locality was probably appropriated by these “Hill-men” as well as by those of the “Mounts;” and the former perhaps designated themselves as “Romans of the Hill” (-Romani collini-). That a diversity of race may have lain at the foundation of this distinction between the two neighbouring cities is possible; but evidence sufficient to warrant our pronouncing a community established on Latin soil to be of alien lineage is, in the case of the Quirinal community, totally wanting.(7)

Relations between the Palatine and Quirinal Communities

Page 51

Thus the site of the Roman commonwealth was still at this period occupied by the Mount-Romans of the Palatine and the Hill-Romans of the Quirinal as two separate communities confronting each other and doubtless in many respects at feud, in some degree resembling the Montigiani and the Trasteverini in modern Rome. That the community of the Seven Mounts early attained a great preponderance over that of the Quirinal may with certainty be inferred both from the greater extent of its newer portions and suburbs, and from the position of inferiority in which the former Hill-Romans were obliged to acquiesce under the later Servian arrangement. But even within the Palatine city there was hardly a true and complete amalgamation of the different constituent elements of the settlement. We have already mentioned how the Subura and the Palatine annually contended for the horse's head; the several Mounts also, and even the several curies (there was as yet no common hearth for the city, but the various hearths of the curies subsisted side by side, although in the same locality) probably felt themselves to be as yet more separated than united; and Rome as a whole was probably rather an aggregate of urban settlements than a single city. It appears from many indications that the houses of the old and powerful families were constructed somewhat after the manner of fortresses and were rendered capable of defence—a precaution, it may be presumed, not unnecessary. It was the magnificent structure ascribed to king Servius Tullius that first surrounded not merely those two cities of the Palatine and Quirinal, but also the heights of the Capitol and the Aventine which were not comprehended within their enclosure, with a single great ring-wall, and thereby created the new Rome—the Rome of history. But ere this mighty work was undertaken, the relations of Rome to the surrounding country had beyond doubt undergone a complete revolution. As the period, during which the husbandman guided his plough on the seven hills of Rome just as on the other hills of Latium, and the usually unoccupied places of refuge on particular summits alone presented the germs of a more permanent settlement, corresponds to the earliest epoch of the Latin stock without trace of traffic or achievement; as thereafter the flourishing settlement on the Palatine and in the “Seven Rings” was coincident with the occupation of the mouths of the Tiber by the Roman community, and with the progress of the Latins to a more stirring and freer intercourse, to an urban civilization in Rome more especially, and perhaps also to a more consolidated political union in the individual states as well as in the confederacy; so the Servian wall, which was the foundation of a single great city, was connected with the epoch at which the city of Rome was able to contend for, and at length to achieve, the sovereignty of the Latin league.

Notes for Book I Chapter IV

Page 52

1. A similar change of sound is exhibited in the case of the following formations, all of them of a very ancient kind: -pars—portio-, -Mars- -Mors-, -farreum- ancient form for -horreum-, -Fabii- -Fovii-, -Valerius- -Volesus-, -vacuus- -vacivus-.
2. The —synoikismos— did not necessarily involve an actual settlement together at one spot; but while each resided as formerly on his own land, there was thenceforth only one council-hall and court-house for the whole (Thucyd. ii. 15; Herodot. i. 170).
3. We might even, looking to the Attic —trittus— and the Umbrian -trifo-, raise the question whether a triple division of the community was not a fundamental principle of the Graeco-Italians: in that case the triple division of the Roman community would not be referable to the amalgamation of several once independent tribes. But, in order to the establishment of a hypothesis so much at variance with tradition, such a threefold division would require to present itself more generally throughout the Graeco-Italian field than seems to be the case, and to appear uniformly everywhere as the ground-scheme. The Umbrians may possibly have adopted the word -tribus- only when they came under the influence of Roman rule; it cannot with certainty be traced in Oscan.
4. Although the older opinion, that Latin is to be viewed as a mixed language made up of Greek and non-Greek elements, has been now abandoned on all sides, judicious inquirers even (e. g. Schwegler, R. G. i. 184, 193) still seek to discover in Latin a mixture of two nearly related Italian dialects. But we ask in vain for the linguistic or historical facts which render such an hypothesis necessary. When a language presents the appearance of being an intermediate link between two others, every philologist knows that the phenomenon may quite as probably depend, and more frequently does depend, on organic development than on external intermixture.
5. That the Quinctian Luperci had precedence in rank over the Fabian is evident from the circumstance that the fabulists attribute the Quinctii to Romulus, the Fabii to Remus (Ovid, Fast. ii. 373 seq.; Vict. De Orig. 22). That the Fabii belonged to the Hill-Romans is shown by the sacrifice of their -gens- on the Quirinal (Liv. v. 46, 52), whether that sacrifice may or may not have been connected with the Lupercalia.

Moreover, the Lupercus of the former college is called in inscriptions (Orelli, 2253) -Lupercus Quinctialis vetus-; and the -praenomen-Kaeso, which was most probably connected with the Lupercal worship (see Rom. Forschungen, i. 17), is found exclusively among the Quinctii and Fabii: the form commonly occurring in authors, -Lupercus Quinctilius- and -Quinctilianus-, is therefore a misnomer, and the college belonged not to the comparatively recent Quinctilii, but to the far older Quinctii. When, again, the Quinctii (Liv. i. 30), or Quinctilii (Dion. iii. 29), are named among the Alban clans, the latter reading is here to be preferred, and the Quinctii are to be regarded rather as an old Roman -gens-.

Page 53

6. Although the name “Hill of Quirinus” was afterwards ordinarily used to designate the height where the Hill-Romans had their abode, we need not at all on that account regard the name “Quirites” as having been originally reserved for the burgesses on the Quirinal. For, as has been shown, all the earliest indications point, as regards these, to the name -Collini-; while it is indisputably certain that the name Quirites denoted from the first, as well as subsequently, simply the full burgess, and had no connection with the distinction between montani and collini (comp. chap. v. infra). The later designation of the Quirinal rests on the circumstance that, while the -Mars quirinus-, the spear-bearing god of Death, was originally worshipped as well on the Palatine as on the Quirinal—as indeed the oldest inscriptions found at what was afterwards called the Temple of Quirinus designate this divinity simply as Mars,—at a later period for the sake of distinction the god of the Mount-Romans more especially was called Mars, the god of the Hill Romans more especially Quirinus.

When the Quirinal is called -collis agonalis-, “hill of sacrifice,” it is so designated merely as the centre of the religious rites of the Hill-Romans.

7. The evidence alleged for this (comp. e. g. Schwegler, S. G. i. 480) mainly rests on an etymologico-historical hypothesis started by Varro and as usual unanimously echoed by later writers, that the Latin -quiris- and -quirinus- are akin to the name of the Sabine town -Cures-, and that the Quirinal hill accordingly had been peopled from -Cures-. Even if the linguistic affinity of these words were more assured, there would be little warrant for deducing from it such a historical inference. That the old sanctuaries on this eminence (where, besides, there was also a “Collis Latiaris”) were Sabine, has been asserted, but has not been proved. Mars quirinus, Sol, Salus, Flora, Semo Sancus or Deus fidius were doubtless Sabine, but they were also Latin, divinities, formed evidently during the epoch when Latins and Sabines still lived undivided. If a name like that of Semo Sancus (which moreover occurs in connection with the Tiber-island) is especially associated with the sacred places of the Quirinal which afterwards diminished in its importance (comp. the Porta Sanqualis deriving its name therefrom), every unbiassed inquirer will recognize in such a circumstance only a proof of the high antiquity of that worship, not a proof of its derivation from a neighbouring land. In so speaking we do not mean to deny that it is possible that old distinctions of race may have co-operated in producing this state of things; but if such was the case, they have, so far as we are concerned, totally disappeared, and the views current among our contemporaries as to the Sabine element in the constitution of Rome are only fitted seriously to warn us against such baseless speculations leading to no result.

CHAPTER V

Page 54

The Original Constitution of Rome

The Roman House

Father and mother, sons and daughters, home and homestead, servants and chattels—such are the natural elements constituting the household in all cases, where polygamy has not obliterated the distinctive position of the mother. But the nations that have been most susceptible of culture have diverged widely from each other in their conception and treatment of the natural distinctions which the household thus presents. By some they have been apprehended and wrought out more profoundly, by others more superficially; by some more under their moral, by others more under their legal aspects. None has equalled the Roman in the simple but inexorable embodiment in law of the principles pointed out by nature herself.

The House-father and His Household

The family formed an unity. It consisted of the free man who upon his father's death had become his own master, and the spouse whom the priests by the ceremony of the sacred salted cake (-confarreatio-) had solemnly wedded to share with him water and fire, with their son and sons' sons and the lawful wives of these, and their unmarried daughters and sons' daughters, along with all goods and substance pertaining to any of its members. The children of daughters on the other hand were excluded, because, if born in wedlock, they belonged to the family of the husband; and if begotten out of wedlock, they had no place in a family at all. To the Roman citizen a house of his own and the blessing of children appeared the end and essence of life. The death of the individual was not an evil, for it was a matter of necessity; but the extinction of a household or of a clan was injurious to the community itself, which in the earliest times therefore opened up to the childless the means of avoiding such a fatality by their adopting the children of others as their own.

The Roman family from the first contained within it the conditions of a higher culture in the moral adjustment of the mutual relations of its members. Man alone could be head of a family. Woman did not indeed occupy a position inferior to man in the acquiring of property and money; on the contrary the daughter inherited an equal share with her brother, and the mother an equal share with her children. But woman always and necessarily belonged to the household, not to the community; and in the household itself she necessarily held a position of domestic subjection—the daughter to her father, the wife to her husband,(1) the fatherless unmarried woman to her nearest male relatives; it was by these, and not by the king, that in case of need woman was called to account. Within the house, however, woman was not servant but mistress. Exempted from the tasks of corn-grinding and cooking which according to Roman ideas belonged to the menials, the Roman housewife devoted herself in the main to the

superintendence of her maid-servants, and to the accompanying labours of the distaff, which was to woman what the plough was to man.(2) In like manner, the moral obligations of parents towards their children were fully and deeply felt by the Roman nation; and it was reckoned a heinous offence if a father neglected or corrupted his child, or if he even squandered his property to his child's disadvantage.

Page 55

In a legal point of view, however, the family was absolutely guided and governed by the single all-powerful will of the “father of the household” (-pater familias-). In relation to him all in the household were destitute of legal rights—the wife and the child no less than the bullock or the slave. As the virgin became by the free choice of her husband his wedded wife, so it rested with his own free will to rear or not to rear the child which she bore to him. This maxim was not suggested by indifference to the possession of a family; on the contrary, the conviction that the founding of a house and the begetting of children were a moral necessity and a public duty had a deep and earnest hold of the Roman mind. Perhaps the only instance of support accorded on the part of the community in Rome is the enactment that aid should be given to the father who had three children presented to him at a birth; while their ideas regarding exposure are indicated by the prohibition of it so far as concerned all the sons—deformed births excepted—and at least the first daughter. Injurious, however, to the public weal as exposure might appear, the prohibition of it soon changed its form from that of legal punishment into that of religious curse; for the father was, above all, thoroughly and absolutely master in his household. The father of the household not only maintained the strictest discipline over its members, but he had the right and duty of exercising judicial authority over them and of punishing them as he deemed fit in life and limb. The grown-up son might establish a separate household or, as the Romans expressed it, maintain his “own cattle” (-peculium-) assigned to him by his father; but in law all that the son acquired, whether by his own labour or by gift from a stranger, whether in his father’s household or in his own, remained the father’s property. So long as the father lived, the persons legally subject to him could never hold property of their own, and therefore could not alienate unless by him so empowered, or yet bequeath. In this respect wife and child stood quite on the same level with the slave, who was not unfrequently allowed to manage a household of his own, and who was likewise entitled to alienate when commissioned by his master. Indeed a father might convey his son as well as his slave in property to a third person: if the purchaser was a foreigner, the son became his slave; if he was a Roman, the son, while as a Roman he could not become a Roman’s slave, stood at least to his purchaser in a slave’s stead (-in mancipii causa-). The paternal and marital power was subject to a legal restriction, besides the one already mentioned on the right Of exposure, only in so far as some of the worst abuses were visited by legal punishment as well as by religious curse. Thus these penalties fell upon the man who sold his wife or married son; and it was a matter of family usage that in the exercise of domestic jurisdiction the father, and still more the husband, should not pronounce sentence on child or wife without having previously consulted the nearest blood-relatives, his wife’s as well as his own. But the latter arrangement involved no legal diminution of power, for the blood-relatives called in to the domestic judgment had not to judge, but simply to advise the father of the household in judging.

Page 56

But not only was the power of the master of the house substantially unlimited and responsible to no one on earth; it was also, as long as he lived, unchangeable and indestructible. According to the Greek as well as Germanic laws the grown-up son, who was practically independent of his father, was also independent legally; but the power of the Roman father could not be dissolved during his life either by age or by insanity, or even by his own free will, excepting only that the person of the holder of the power might change, for the child might certainly pass by way of adoption into the power of another father, and the daughter might pass by a lawful marriage out of the hand of her father into the hand of her husband and, leaving her own -gens- and the protection of her own god to enter into the -gens- of her husband and the protection of his god, became thenceforth subject to him as she had hitherto been to her father. According to Roman law it was made easier for the slave to obtain release from his master than for the son to obtain release from his father; the manumission of the former was permitted at an early period, and by simple forms; the release of the latter was only rendered possible at a much later date, and by very circuitous means. Indeed, if a master sold his slave and a father his son and the purchaser released both, the slave obtained his freedom, but the son by the release simply reverted into his father's power as before. Thus the inexorable consistency with which the Romans carried out their conception of the paternal and marital power converted it into a real right of property.

Closely, however, as the power of the master of the household over wife and child approximated to his proprietary power over slaves and cattle, the members of the family were nevertheless separated by a broad line of distinction, not merely in fact but in law, from the family property. The power of the house-master—even apart from the fact that it appeared in operation only within the house—was of a transient, and in some degree of a representative, character. Wife and child did not exist merely for the house-father's sake in the sense in which property exists only for the proprietor, or in which the subjects of an absolute state exist only for the king; they were the objects indeed of a legal right on his part, but they had at the same time capacities of right of their own; they were not things, but persons. Their rights were dormant in respect of exercise, simply because the unity of the household demanded that it should be governed by a single representative; but when the master of the household died, his sons at once came forward as its masters and now obtained on their own account over the women and children and property the rights hitherto exercised over these by the father. On the other hand the death of the master occasioned no change in the legal position of the slave.

Family and Clan (-Gens-)

Page 57

So strongly was the unity of the family realized, that even the death of the master of the house did not entirely dissolve it. The descendants, who were rendered by that occurrence independent, regarded themselves as still in many respects an unity; a principle which was made use of in arranging the succession of heirs and in many other relations, but especially in regulating the position of the widow and unmarried daughters. As according to the older Roman view a woman was not capable of having power either over others or over herself, the power over her, or, as it was in this case more mildly expressed, the “guardianship” (-tutela-) remained with the house to which she belonged, and was now exercised in the room of the deceased house-master by the whole of the nearest male members of the family; ordinarily, therefore, by sons over their mother and by brothers over their sisters. In this sense the family, once founded, endured unchanged till the male stock of its founder died out; only the bond of connection must of course have become practically more lax from generation to generation, until at length it became impossible to prove the original unity. On this, and on this alone, rested the distinction between family and clan, or, according to the Roman expression, between -agnati- and -gentiles-. Both denoted the male stock; but the family embraced only those individuals who, mounting up from generation to generation, were able to set forth the successive steps of their descent from a common progenitor; the clan (-gens-) on the other hand comprehended also those who were merely able to lay claim to such descent from a common ancestor, but could no longer point out fully the intermediate links so as to establish the degree of their relationship. This is very clearly expressed in the Roman names: when they speak of “Quintus, son of Quintus, grandson of Quintus and so on, the Quintian,” the family reaches as far as the ascendants are designated individually, and where the family terminates the clan is introduced supplementary, indicating derivation from the common ancestor who has bequeathed to all his descendants the name of the “children of Quintus.”

Dependents of the Household

To these strictly closed unities—the family or household united under the control of a living master, and the clan which originated out of the breaking-up of such households—there further belonged the dependents or “listeners” (-clientes-, from -cluere-). This term denoted not the guests, that is, the members of other similar circles who were temporarily sojourning in another household than their own, and as little the slaves, who were looked upon in law as the property of the household and not as members of it, but those individuals who, while they were not free burgesses of any commonwealth, yet lived within one in a condition of protected freedom. These included refugees who had found a reception

Page 58

with a foreign protector, and those slaves in respect of whom their master had for the time being waived the exercise of his rights, and so conferred on them practical freedom. This relation had not the distinctive character of a strict relation -de jure-, like that of a man to his guest: the client remained a man non-free, in whose case good faith and use and wont alleviated the condition of non-freedom. Hence the "listeners" of the household (-clientes-) together with the slaves strictly so called formed the "body of servants" (-familia-) dependent on the will of the "burgess" (-patronus-, like -patricius-). Hence according to original right the burgess was entitled partially or wholly to resume the property of the client, to reduce him on emergency once more to the state of slavery, to inflict even capital punishment on him; and it was simply in virtue of a distinction -de facto-, that these patrimonial rights were not asserted with the same rigour against the client as against the actual slave, and that on the other hand the moral obligation of the master to provide for his own people and to protect them acquired a greater importance in the case of the client, who was practically in a more free position, than in the case of the slave. Especially must the -de facto- freedom of the client have approximated to freedom -de jure- in those cases where the relation had subsisted for several generations: when the releaser and the released had themselves died, the -dominium- over the descendants of the released person could not be without flagrant impiety claimed by the heirs at law of the releaser; and thus there was gradually formed within the household itself a class of persons in dependent freedom, who were different alike from the slaves and from the members of the -gens- entitled in the eye of the law to full and equal rights.

The Roman Community

On this Roman household was based the Roman state, as respected both its constituent elements and its form. The community of the Roman people arose out of the junction (in whatever way brought about) of such ancient clanships as the Romilii, Voltinii, Fabii, etc.; the Roman domain comprehended the united lands of those clans. (3) Whoever belonged to one of these clans was a burgess of Rome. Every marriage concluded in the usual forms within this circle was valid as a true Roman marriage, and conferred burgess-rights on the children begotten of it. Whoever was begotten in an illegal marriage, or out of marriage, was excluded from the membership of the community. On this account the Roman burgesses assumed the name of the "father's children" (-patricii-), inasmuch as they alone in the eye of the law had a father. The clans with all the families that they contained were incorporated with the state just as they stood. The spheres of the household and the clan continued to subsist within the state; but the position which a man held in these

Page 59

did not affect his relations towards the state. The son was subject to the father within the household, but in political duties and rights he stood on a footing of equality. The position of the protected dependents was naturally so far changed that the freedmen and clients of every patron received on his account toleration in the community at large; they continued indeed to be immediately dependent on the protection of the family to which they belonged, but the very nature of the case implied that the clients of members of the community could not be wholly excluded from its worship and its festivals, although, of course, they were not capable of the proper rights or liable to the proper duties of burgesses. This remark applies still more to the case of the protected dependents of the community at large. The state thus consisted, like the household, of persons properly belonging to it and of dependents—of “burgesses” and of “inmates” or —metoeci—.

The King

As the clans resting upon a family basis were the constituent elements of the state, so the form of the body-politic was modelled after the family both generally and in detail. The household was provided by nature herself with a head in the person of the father with whom it originated, and with whom it perished. But in the community of the people, which was designed to be imperishable, there was no natural master; not at least in that of Rome, which was composed of free and equal husbandmen and could not boast of a nobility by the grace of God. Accordingly one from its own ranks became its “leader” (-rex-) and lord in the household of the Roman community; as indeed at a later period there were to be found in or near to his dwelling the always blazing hearth and the well-barred store-chamber of the community, the Roman Vestas and the Roman Penates—indications of the visible unity of that supreme household which included all Rome. The regal office began at once and by right, when the position had become vacant and the successor had been designated; but the community did not owe full obedience to the king until he had convoked the assembly of freemen capable of bearing arms and had formally challenged its allegiance. Then he possessed in its entirety that power over the community which belonged to the house-father in his household; and, like him, he ruled for life. He held intercourse with the gods of the community, whom he consulted and appeased (-auspicia publica-), and he nominated all the priests and priestesses. The agreements which he concluded in name of the community with foreigners were binding upon the whole people; although in other instances no member of the community was bound by an agreement with a non-member. His “command” (-imperium-) was all-powerful in peace and in war, on which account “messengers” (-lictiores-, from -licere-, to summon) preceded him with axes and rods on all occasions when he appeared

Page 60

officially. He alone had the right of publicly addressing the burgesses, and it was he who kept the keys of the public treasury. He had the same right as a father had to exercise discipline and jurisdiction. He inflicted penalties for breaches of order, and, in particular, flogging for military offences. He sat in judgment in all private and in all criminal processes, and decided absolutely regarding life and death as well as regarding freedom; he might hand over one burgess to fill the place of a slave to another; he might even order a burgess to be sold into actual slavery or, in other words, into banishment. When he had pronounced sentence of death, he was entitled, but not obliged, to allow an appeal to the people for pardon. He called out the people for service in war and commanded the army; but with these high functions he was no less bound, when an alarm of fire was raised, to appear in person at the scene of the burning.

As the house-master was not simply the greatest but the only power in the house, so the king was not merely the first but the only holder of power in the state. He might indeed form colleges of men of skill composed of those specially conversant with the rules of sacred or of public law, and call upon them for their advice; he might, to facilitate his exercise of power, entrust to others particular functions, such as the making communications to the burgesses, the command in war, the decision of processes of minor importance, the inquisition of crimes; he might in particular, if he was compelled to quit the bounds of the city, leave behind him a "city-warden" (-*praefectus urbi*-) with the full powers of an -alter ego-; but all official power existing by the side of the king's was derived from the latter, and every official held his office by the king's appointment and during the king's pleasure. All the officials of the earliest period, the extraordinary city-warden as well as the "leaders of division" (-*tribuni*-, from -*tribus*-, part) of the infantry (-*milites*-) and of the cavalry (-*celeres*-) were merely commissioned by the king, and not magistrates in the subsequent sense of the term. The regal power had not and could not have any external check imposed upon it by law: the master of the community had no judge of his acts within the community, any more than the housefather had a judge within his household. Death alone terminated his power. The choice of the new king lay with the council of elders, to which in case of a vacancy the interim-kingship (-*interregnum*-) passed. A formal cooperation in the election of king pertained to the burgesses only after his nomination; -*de jure*- the kingly office was based on the permanent college of the Fathers (-*patres*-), which by means of the interim holder of the power installed the new king for life. Thus "the august blessing of the gods, under which renowned Rome was founded," was transmitted from its first regal recipient in constant succession to those that followed him, and the unity of the state was preserved unchanged notwithstanding the personal change of the holders of power.

Page 61

This unity of the Roman people, represented in the field of religion by the Roman Diovīs, was in the field of law represented by the prince, and therefore his costume was the same as that of the supreme god; the chariot even in the city, where every one else went on foot, the ivory sceptre with the eagle, the vermillion-painted face, the chaplet of oaken leaves in gold, belonged alike to the Roman god and to the Roman king. It would be a great error, however, to regard the Roman constitution on that account as a theocracy: among the Italians the ideas of god and king never faded away into each other, as they did in Egypt and the East. The king was not the god of the people; it were much more correct to designate him as the proprietor of the state. Accordingly the Romans knew nothing of special divine grace granted to a particular family, or of any other sort of mystical charm by which a king should be made of different stuff from other men: noble descent and relationship with earlier rulers were recommendations, but were not necessary conditions; the office might be lawfully filled by any Roman come to years of discretion and sound in body and mind.⁽⁴⁾ The king was thus simply an ordinary burgess, whom merit or fortune, and the primary necessity of having one as master in every house, had placed as master over his equals—a husbandman set over husbandmen, a warrior set over warriors. As the son absolutely obeyed his father and yet did not esteem himself inferior, so the burgess submitted to his ruler without precisely accounting him his better. This constituted the moral and practical limitation of the regal power. The king might, it is true, do much that was inconsistent with equity without exactly breaking the law of the land: he might diminish his fellow-combatants' share of the spoil; he might impose exorbitant task-works or otherwise by his imposts unreasonably encroach upon the property of the burgess; but if he did so, he forgot that his plenary power came not from God, but under God's consent from the people, whose representative he was; and who was there to protect him, if the people should in return forget the oath of allegiance which they had sworn? The legal limitation, again, of the king's power lay in the principle that he was entitled only to execute the law, not to alter it. Every deviation from the law had to receive the previous approval of the assembly of the people and the council of elders; if it was not so approved, it was a null and tyrannical act carrying no legal effect. Thus the power of the king in Rome was, both morally and legally, at bottom altogether different from the sovereignty of the present day; and there is no counterpart at all in modern life either to the Roman household or to the Roman state.

The Community

Page 62

The division of the body of burgesses was based on the “wardship,” -curia- (probably related to -curare- = -coerare-, —koiranos—); ten wardships formed the community; every wardship furnished a hundred men to the infantry (hence -mil-es-, like -equ-es-, the thousand-walker), ten horsemen and ten councillors. When communities combined, each of course appeared as a part (-tribus-) of the whole community (-tota-in Umbrian and Oscan), and the original unit became multiplied by the number of such parts. This division had reference primarily to the personal composition of the burgess-body, but it was applied also to the domain so far as the latter was apportioned at all. That the curies had their lands as well as the tribes, admits of the less doubt, since among the few names of the Roman curies that have been handed down to us we find along with some apparently derived from -gentes-, e. g. -Faucia-, others certainly of local origin, e. g. -Veliensis-; each one of them embraced, in this primitive period of joint possession of land, a number of clan-lands, of which we have already spoken.(5)

We find this constitution under its simplest form(6) in the scheme of the Latin or burgess communities that subsequently sprang up under the influence of Rome; these had uniformly the number of a hundred councillors (-centumviri-). But the same normal numbers make their appearance throughout in the earliest tradition regarding the tripartite Rome, which assigns to it thirty curies, three hundred horsemen, three hundred senators, three thousand foot-soldiers.

Nothing is more certain than that this earliest constitutional scheme did not originate in Rome; it was a primitive institution common to all the Latins, and perhaps reached back to a period anterior to the separation of the stocks. The Roman constitutional tradition quite deserving of credit in such matters, while it accounts historically for the other divisions of the burgesses, makes the division into curies alone originate with the origin of the city; and in entire harmony with that view not only does the curial constitution present itself in Rome, but in the recently discovered scheme of the organization of the Latin communities it appears as an essential part of the Latin municipal system.

The essence of this scheme was, and remained, the distribution into curies. The tribes (“parts”) cannot have been an element of essential importance for the simple reason that their occurrence at all was, not less than their number, the result of accident; where there were tribes, they certainly had no other significance than that of preserving the remembrance of an epoch when such “parts” had themselves been wholes.(7) There is no tradition that the individual tribes had special presiding magistrates or special assemblies of their own; and it is highly probable that in the interest of the unity of the commonwealth the tribes which had joined together to form it were

Page 63

never in reality allowed to have such institutions. Even in the army, it is true, the infantry had as many pairs of leaders as there were tribes; but each of these pairs of military tribunes did not command the contingent of a tribe; on the contrary each individual war-tribune, as well as all in conjunction, exercised command over the whole infantry. The clans were distributed among the several curies; their limits and those of the household were furnished by nature. That the legislative power interfered in these groups by way of modification, that it subdivided the large clan and counted it as two, or joined several weak ones together, there is no indication at all in Roman tradition; at any rate this took place only in a way so limited that the fundamental character of affinity belonging to the clan was not thereby altered. We may not therefore conceive the number of the clans, and still less that of the households, as a legally fixed one; if the -curia- had to furnish a hundred men on foot and ten horsemen, it is not affirmed by tradition, nor is it credible, that one horseman was taken from each clan and one foot-soldier from each house. The only member that discharged functions in the oldest constitutional organization was the -curia-. Of these there were ten, or, where there were several tribes, ten to each tribe. Such a "wardship" was a real corporate unity, the members of which assembled at least for holding common festivals. Each wardship was under the charge of a special warden (-curio-), and had a priest of its own (-flamen curialis-); beyond doubt also levies and valuations took place according to curies, and in judicial matters the burgesses met by curies and voted by curies. This organization, however, cannot have been introduced primarily with a view to voting, for in that case they would certainly have made the number of subdivisions uneven.

Equality of the Burgesses

Sternly defined as was the contrast between burgess and non-burgess, the equality of rights within the burgess-body was complete. No people has ever perhaps equalled that of Rome in the inexorable rigour with which it has carried out these principles, the one as fully as the other. The strictness of the Roman distinction between burgesses and non-burgesses is nowhere perhaps brought out with such clearness as in the treatment of the primitive institution of honorary citizenship, which was originally designed to mediate between the two. When a stranger was, by resolution of the community, adopted into the circle of the burgesses, he might surrender his previous citizenship, in which case he passed over wholly into the new community; but he might also combine his former citizenship with that which had just been granted to him. Such was the primitive custom, and such it always remained in Hellas, where in later ages the same person not unfrequently held the freedom of several communities at the same time. But

Page 64

the greater vividness with which the conception of the community as such was realized in Latium could not tolerate the idea that a man might simultaneously belong in the character of a burgess to two communities; and accordingly, when the newly-chosen burgess did not intend to surrender his previous franchise, it attached to the nominal honorary citizenship no further meaning than that of an obligation to befriend and protect the guest (-jus hospitii-), such as had always been recognized as incumbent in reference to foreigners. But this rigorous retention of barriers against those that were without was accompanied by an absolute banishment of all difference of rights among the members included in the burgess community of Rome. We have already mentioned that the distinctions existing in the household, which of course could not be set aside, were at least ignored in the community; the son who as such was subject in property to his father might thus, in the character of a burgess, come to have command over his father as master. There were no class-privileges: the fact that the Titii took precedence of the Ramnes, and both ranked before the Luceres, did not affect their equality in all legal rights. The burgess cavalry, which at this period was used for single combat in front of the line on horseback or even on foot, and was rather a select or reserve corps than a special arm of the service, and which accordingly contained by far the wealthiest, best-armed, and best-trained men, was naturally held in higher estimation than the burgess infantry; but this was a distinction purely -de facto-, and admittance to the cavalry was doubtless conceded to any patrician. It was simply and solely the constitutional subdivision of the burgess-body that gave rise to distinctions recognized by the law; otherwise the legal equality of all the members of the community was carried out even in their external appearance. Dress indeed served to distinguish the president of the community from its members, the grown-up man under obligation of military service from the boy not yet capable of enrolment; but otherwise the rich and the noble as well as the poor and low-born were only allowed to appear in public in the like simple wrapper (-toga-) of white woollen stuff. This complete equality of rights among the burgesses had beyond doubt its original basis in the Indo-Germanic type of constitution; but in the precision with which it was thus apprehended and embodied it formed one of the most characteristic and influential peculiarities of the Latin nation. And in connection with this we may recall the fact that in Italy we do not meet with any race of earlier settlers less capable of culture, that had become subject to the Latin immigrants.(8) They had no conquered race to deal with, and therefore no such condition of things as that which gave rise to the Indian system of caste, to the nobility of Thessaly and Sparta and perhaps of Hellas generally, and probably also to the Germanic distinction of ranks.

Page 65

Burdens of the Burgesses

The maintenance of the state economy devolved, of course, upon the burgesses. The most important function of the burgess was his service in the army; for the burgesses had the right and duty of bearing arms. The burgesses were at the same time the “body of warriors” (-populus-, related to -populari-, to lay waste): in the old litanies it is upon the “spear-armed body of warriors” (-pilumnus poplus-) that the blessing of Mars is invoked; and even the designation with which the king addresses them, that of Quirites, (9) is taken as signifying “warrior.” We have already stated how the army of aggression, the “gathering” (-legio-), was formed. In the tripartite Roman community it consisted of three “hundreds” (-centuriae-) of horsemen (-celeres-, “the swift,” or -flexuntes-, “the wheelers”) under the three leaders-of-division of the horsemen (-tribuni celerum-)(10) and three “thousands” of footmen (-milties-) under the three leaders-of-division of the infantry (-tribuni militum-), the latter were probably from the first the flower of the general levy. To these there may perhaps have been added a number of light-armed men, archers especially, fighting outside of the ranks.(11) The general was regularly the king himself. Besides service in war, other personal burdens might devolve upon the burgesses; such as the obligation of undertaking the king’s commissions in peace and in war,(12) and the task-work of tilling the king’s lands or of constructing public buildings. How heavily in particular the burden of building the walls of the city pressed upon the community, is evidenced by the fact that the ring-walls retained the name of “tasks” (-moenia-). There was no regular direct taxation, nor was there any direct regular expenditure on the part of the state. Taxation was not needed for defraying the burdens of the community, since the state gave no recompense for serving in the army, for task-work, or for public service generally; so far as there was any such recompense at all, it was given to the person who performed the service either by the district primarily concerned in it, or by the person who could not or would not himself serve. The victims needed for the public service of the gods were procured by a tax on actions at law; the defeated party in an ordinary process paid down to the state a cattle-fine (-sacramentum-) proportioned to the value of the object in dispute. There is no mention of any regular presents to the king on the part of the burgesses. On the other hand there flowed into the royal coffers the port-duties,(13) as well as the income from the domains—in particular, the pasture tribute (-scriptura-) from the cattle driven out upon the common pasture, and the quotas of produce (-vectigalia-) which those enjoying the use of the lands of the state had to pay instead of rent. To this was added the produce of cattle-fines and confiscations and the gains of war. In cases of need a contribution (-tributum-) was imposed, which was looked upon, however, as a forced loan and was repaid when the times improved; whether it fell upon the burgesses generally, or only upon the —metoeci—, cannot be determined; the latter supposition is, however, the more probable.

Page 66

The king managed the finances. The property of the state, however, was not identified with the private property of the king; which, judging from the statements regarding the extensive landed possessions of the last Roman royal house, the Tarquins, must have been considerable. The ground won by arms, in particular, appears to have been constantly regarded as property of the state. Whether and how far the king was restricted by use and wont in the administration of the public property, can no longer be ascertained; only the subsequent course of things shows that the burgesses can never have been consulted regarding it, whereas it was probably the custom to consult the senate in the imposition of the -tributum- and in the distribution of the lands won in war.

Rights of the Burgesses

The Roman burgesses, however, do not merely come into view as furnishing contributions and rendering service; they also bore a part in the public government. For this purpose all the members of the community (with the exception of the women, and the children still incapable of bearing arms)—in other words, the “spearmen” (-quirites-) as in addressing them they were designated—assembled at the seat of justice, when the king convoked them for the purpose of making a communication (-conventio-, -contio-) or formally bade them meet (-comitia-) for the third week (-in trinum noundinum-), to consult them by curies. He appointed such formal assemblies of the community to be held regularly twice a year, on the 24th of March and the 24th of May, and as often besides as seemed to him necessary. The burgesses, however, were always summoned not to speak, but to hear; not to ask questions, but to answer. No one spoke in the assembly but the king, or he to whom the king saw fit to grant liberty of speech; and the speaking of the burgesses consisted of a simple answer to the question of the king, without discussion, without reasons, without conditions, without breaking up the question even into parts. Nevertheless the Roman burgess-community, like the Germanic and not improbably the primitive Indo-Germanic communities in general, was the real and ultimate basis of the political idea of sovereignty. But in the ordinary course of things this sovereignty was dormant, or only had its expression in the fact that the burgess-body voluntarily bound itself to render allegiance to its president. For that purpose the king, after he had entered on his office, addressed to the assembled curies the question whether they would be true and loyal to him and would according to use and wont acknowledge himself as well as his messengers (-lictors-); a question, which undoubtedly might no more be answered in the negative than the parallel homage in the case of a hereditary monarchy might be refused.

Page 67

It was in thorough consistency with constitutional principles that the burgesses, just as being the sovereign power, should not on ordinary occasions take part in the course of public business. So long as public action was confined to the carrying into execution of the existing legal arrangements, the power which was, properly speaking, sovereign in the state could not and might not interfere: the laws governed, not the lawgiver. But it was different where a change of the existing legal arrangements or even a mere deviation from them in a particular case was necessary; and here accordingly, under the Roman constitution, the burgesses emerge without exception as actors; so that each act of the sovereign authority is accomplished by the co-operation of the burgesses and the king or -interrex-. As the legal relation between ruler and ruled was itself sanctioned after the manner of a contract by oral question and answer, so every sovereign act of the community was accomplished by means of a question (-rogatio-), which the king addressed to the burgesses, and to which the majority of the curies gave an affirmative answer. In this case their consent might undoubtedly be refused. Among the Romans, therefore, law was not primarily, as we conceive it, a command addressed by the sovereign to the whole members of the community, but primarily a contract concluded between the constitutive powers of the state by address and counter-address.(14) Such a legislative contract was -de jure- requisite in all cases which involved a deviation from the ordinary consistency of the legal system. In the ordinary course of law any one might without restriction give away his property to whom he would, but only upon condition of its immediate transfer: that the property should continue for the time being with the owner, and at his death pass over to another, was a legal impossibility—unless the community should allow it; a permission which in this case the burgesses could grant not only when assembled in their curies, but also when drawn up for battle. This was the origin of testaments. In the ordinary course of law the freeman could not lose or surrender the inalienable blessing of freedom, and therefore one who was subject to no housemaster could not subject himself to another in the place of a son—unless the community should grant him leave to do so. This was the -abrogatio-. In the ordinary course of law burgess-rights could only be acquired by birth and could never be lost—unless the community should confer the patriciate or allow its surrender; neither of which acts, doubtless, could be validly done originally without a decree of the curies. In the ordinary course of law the criminal whose crime deserved death, when once the king or his deputy had pronounced sentence according to judgment and justice, was inexorably executed; for the king could only judge, not pardon—unless the condemned burgess appealed to the mercy of the community and the judge

Page 68

allowed him the opportunity of pleading for pardon. This was the beginning of the -provocatio-, which for that reason was especially permitted not to the transgressor who had refused to plead guilty and had been convicted, but to him who confessed his crime and urged reasons in palliation of it. In the ordinary course of law the perpetual treaty concluded with a neighbouring state might not be broken—unless the burgesses deemed themselves released from it on account of injuries inflicted on them. Hence it was necessary that they should be consulted when an aggressive war was contemplated, but not on occasion of a defensive war, where the other state had broken the treaty, nor on the conclusion of peace; it appears, however, that the question was in such a case addressed not to the usual assembly of the burgesses, but to the army. Thus, in general, it was necessary to consult the burgesses whenever the king meditated any innovation, any change of the existing public law; and in so far the right of legislation was from antiquity not a right of the king, but a right of the king and the community. In these and all similar cases the king could not act with legal effect without the cooperation of the community; the man whom the king alone declared a patrician remained as before a non-burgess, and the invalid act could only carry consequences possibly -de facto-, not -de jure-. Thus far the assembly of the community, however restricted and bound at its emergence, was yet from antiquity a constituent element of the Roman commonwealth, and was in law superior to, rather than co-ordinate with, the king.

The Senate

But by the side of the king and of the burgess-assembly there appears in the earliest constitution of the community a third original power, not destined for acting like the former or for resolving like the latter, and yet co-ordinate with both and within its own rightful sphere placed over both. This was the council of elders or -senatus-. Beyond doubt it had its origin in the clan-constitution: the old tradition that in the original Rome the senate was composed of all the heads of households is correct in state-law to this extent, that each of the clans of the later Rome which had not merely migrated thither at a more recent date referred its origin to one of those household-fathers of the primitive city as its ancestor and patriarch. If, as is probable, there was once in Rome or at any rate in Latium a time when, like the state itself, each of its ultimate constituents, that is to say each clan, had virtually a monarchical organization and was under the rule of an elder—whether raised to that position by the choice of the clansmen or of his predecessor, or in virtue of hereditary succession—the senate of that time was nothing but the collective body of these clan-elders, and accordingly an institution independent of the king and of the burgess-assembly; in contradistinction to

Page 69

the latter, which was directly composed of the whole body of the burgesses, it was in some measure a representative assembly of persons acting for the people. Certainly that stage of independence when each clan was virtually a state was surmounted in the Latin stock at an immemorially early period, and the first and perhaps most difficult step towards developing the community out of the clan-organization—the setting aside of the clan-elders—had possibly been taken in Latium long before the foundation of Rome; the Roman clan, as we know it, is without any visible head, and no one of the living clansmen is especially called to represent the common patriarch from whom all the clansmen descend or profess to descend so that even inheritance and guardianship, when they fall by death to the clan, devolve on the clan-members as a whole. Nevertheless the original character of the council of elders bequeathed many and important legal consequences to the Roman senate. To express the matter briefly, the position of the senate as something other and more than a mere state-council—than an assemblage of a number of trusty men whose advice the king found it fitting to obtain—hinged entirely on the fact that it was once an assembly, like that described by Homer, of the princes and rulers of the people sitting for deliberation in a circle round the king. So long as the senate was formed by the aggregate of the heads of clans, the number of the members cannot have been a fixed one, since that of the clans was not so; but in the earliest, perhaps even in pre-Roman, times the number of the members of the council of elders for the community had been fixed without respect to the number of the then existing clans at a hundred, so that the amalgamation of the three primitive communities had in state-law the necessary consequence of an increase of the seats in the senate to what was thenceforth the fixed normal number of three hundred. Moreover the senators were at all times called to sit for life; and if at a later period the lifelong tenure subsisted more -de facto-than -de jure-, and the revisions of the senatorial list that took place from time to time afforded an opportunity to remove the unworthy or the unacceptable senator, it can be shown that this arrangement only arose in the course of time. The selection of the senators certainly, after there were no longer heads of clans, lay with the king; but in this selection during the earlier epoch, so long as the people retained a vivid sense of the individuality of the clans, it was probably the rule that, when a senator died, the king should call another experienced and aged man of the same clanship to fill his place. It was only, we may surmise, when the community became more thoroughly amalgamated and inwardly united, that this usage was departed from and the selection of the senators was left entirely to the free judgment of the king, so that he was only regarded as failing in his duty when he omitted to fill up vacancies.

Page 70

Prerogatives of the Senate. The -Interregnum-

The prerogatives of this council of elders were based on the view that the rule over the community composed of clans rightfully belonged to the collective clan-elders, although in accordance with the monarchical principle of the Romans, which already found so stern an expression in the household, that rule could only be exercised for the time being by one of these elders, namely the king. Every member of the senate accordingly was as such, not in practice but in prerogative, likewise king of the community; and therefore his insignia, though inferior to those of the king, were of a similar character: he wore the red shoe like the king; only that of the king was higher and more handsome than that of the senator. On this ground, moreover, as was already mentioned, the royal power in the Roman community could never be left vacant. When the king died, the elders at once took his place and exercised the prerogatives of regal power. According to the immutable principle however that only one can be master at a time, even now it was only one of them that ruled, and such an “interim king” (-interrex-) was distinguished from the king nominated for life simply in respect to the duration, not in respect to the plenitude, of his authority. The duration of the office of -interrex- was fixed for the individual holders at not more than five days; it circulated accordingly among the senators on the footing that, until the royal office was again permanently filled up, the temporary holder at the expiry of that term nominated a successor to himself, likewise for five days, agreeably to the order of succession fixed by lot. There was not, as may readily be conceived, any declaration of allegiance to the -interrex- on the part of the community. Nevertheless the -interrex- was entitled and bound not merely to perform all the official acts otherwise pertaining to the king, but even to nominate a king for life— with the single exception, that this latter right was not vested in the first who held the office, presumably because the first was regarded as defectively appointed inasmuch as he was not nominated by his predecessor. Thus this assembly of elders was the ultimate holder of the ruling power (-imperium-) and the divine protection (-auspicia-) of the Roman commonwealth, and furnished the guarantee for the uninterrupted continuance of that commonwealth and of its monarchical—though not hereditarily monarchical—organization. If therefore this senate subsequently seemed to the Greeks to be an assembly of kings, this was only what was to be expected; it had in fact been such originally.

The Senate and the Resolutions of the Community: -Patrum Auctoritas-

Page 71

But it was not merely in so far as the idea of a perpetual kingdom found its living expression in this assembly, that it was an essential member of the Roman constitution. The council of elders, indeed, had no title to interfere with the official functions of the king. The latter doubtless, in the event of his being unable personally to lead the army or to decide a legal dispute, took his deputies at all times from the senate; for which reason subsequently the highest posts of command were regularly bestowed on senators alone, and senators were likewise employed by preference as jurymen. But the senate, in its collective capacity, was never consulted in the leading of the army or in the administration of justice; and therefore there was no right of military command and no jurisdiction vested in the senate of the later Rome. On the other hand the council of elders was held as called to the guardianship of the existing constitution against encroachments by the king and the burgesses. On the senate devolved the duty of examining every resolution adopted by the burgesses at the suggestion of the king, and of refusing to confirm it if it seemed to violate existing rights; or, which was the same thing, in all cases where a resolution of the community was constitutionally requisite—as on every alteration of the constitution, on the reception of new burgesses, on the declaration of an aggressive war—the council of elders had a right of veto. This may not indeed be regarded in the light of legislation pertaining jointly to the burgesses and the senate, somewhat in the same way as to the two chambers in the constitutional state of the present day; the senate was not so much law-maker as law-guardian, and could only cancel a decree when the community seemed to have exceeded its competence—to have violated by its decree existing obligations towards the gods or towards foreign states or organic institutions of the community. But still it was a matter of the greatest importance that—to take an example—when the Roman king had proposed a declaration of war and the burgesses had converted it into a decree, and when the satisfaction which the foreign community seemed bound to furnish had been demanded in vain, the Roman envoy invoked the gods as witnesses of the wrong and concluded with the words, “But on these matters we shall consult the elders at home how we may obtain our rights;” it was only when the council of elders had declared its consent, that the war now decreed by the burgesses and approved by the senate was formally declared. Certainly it was neither the design nor the effect of this rule to occasion a constant interference of the senate with the resolutions of the burgesses, and by such guardianship to divest them of their sovereign power; but, as in the event of a vacancy in the supreme office the senate secured the continuance of the constitution, we find it here also as the shield of legal order in opposition even to the supreme power—the community.

Page 72

The Senate As State-Council

With this arrangement was probably connected the apparently very ancient usage, in virtue of which the king previously submitted to the senate the proposals that were to be brought before the burgesses, and caused all its members one after another to give their opinion on the subject. As the senate had the right of cancelling the resolution adopted, it was natural for the king to assure himself beforehand that no opposition was to be apprehended from that quarter; as indeed in general, on the one hand, it was in accordance with Roman habits not to decide matters of importance without having taken counsel with other men, and on the other hand the senate was called, in virtue of its very composition, to act as a state-council to the ruler of the community. It was from this usage of giving counsel, far more than from the prerogatives which we have previously described, that the subsequent extensive powers of the senate were developed; but it was in its origin insignificant and really amounted only to the prerogative of the senators to answer, when they were asked a question. It may have been usual to ask the previous opinion of the senate in affairs of importance which were neither judicial nor military, as, for instance—apart from the proposals to be submitted to the assembly of the people—in the imposition of task-works and taxes, in the summoning of the burgesses to war-service, and in the disposal of the conquered territory; but such a previous consultation, though usual, was not legally necessary. The king convoked the senate when he pleased, and laid before it his questions; no senator might declare his opinion unasked, still less might the senate meet without being summoned, except in the single case of its meeting on occasion of a vacancy to settle the order of succession in the office of -interrex-. That the king was moreover at liberty to call in and consult other men whom he trusted alongside of, and at the same time with, the senators, is in a high degree probable. The advice, accordingly, was not a command; the king might omit to comply with it, while the senate had no other means for giving practical effect to its views except the already-mentioned right of cassation, which was far from being universally applicable. “I have chosen you, not that ye may be my guides, but that ye may do my bidding:” these words, which a later author puts into the mouth of king Romulus, certainly express with substantial correctness the position of the senate in this respect.

The Original Constitution of Rome

Page 73

Let us now sum up the results. Sovereignty, as conceived by the Romans, was inherent in the community of burgesses; but the burgess-body was never entitled to act alone, and was only entitled to co-operate in action, when there was to be a departure from existing rules. By its side stood the assembly of the elders of the community appointed for life, virtually a college of magistrates with regal power, called in the event of a vacancy in the royal office to administer it by means of their own members until it should be once more definitively filled, and entitled to overturn the illegal decrees of the community. The royal power itself was, as Sallust says, at once absolute and limited by the laws (-imperium legitimum-); absolute, in so far as the king's command, whether righteous or not, must in the first instance be unconditionally obeyed; limited, in so far as a command contravening established usage and not sanctioned by the true sovereign—the people—carried no permanent legal consequences. The oldest constitution of Rome was thus in some measure constitutional monarchy inverted. In that form of government the king is regarded as the possessor and vehicle of the plenary power of the state, and accordingly acts of grace, for example, proceed solely from him, while the administration of the state belongs to the representatives of the people and to the executive responsible to them. In the Roman constitution the community of the people exercised very much the same functions as belong to the king in England: the right of pardon, which in England is a prerogative of the crown, was in Rome a prerogative of the community; while all government was vested in the president of the state.

If, in conclusion, we inquire as to the relation of the state itself to its individual members, we find the Roman polity equally remote from the laxity of a mere defensive combination and from the modern idea of an absolute omnipotence of the state. The community doubtless exercised power over the person of the burgess in the imposition of public burdens, and in the punishment of offences and crimes; but any special law inflicting, or threatening to inflict, punishment on an individual on account of acts not universally recognized as penal always appeared to the Romans, even when there was no flaw in point of form, an arbitrary and unjust proceeding. Far more restricted still was the power of the community in respect of the rights of property and the rights of family which were coincident, rather than merely connected, with these; in Rome the household was not absolutely annihilated and the community aggrandized at its expense, as was the case in the police organization of Lycurgus. It was one of the most undeniable as well as one of the most remarkable principles of the primitive constitution of Rome, that the state might imprison or hang the burgess, but might not take away from him his son or his field or even lay permanent taxation on him. In these and similar things

Page 74

the community itself was restricted from encroaching on the burgess, nor was this restriction merely ideal; it found its expression and its practical application in the constitutional veto of the senate, which was certainly entitled and bound to annul any resolution of the community contravening such an original right. No community was so all-powerful within its own sphere as the Roman; but in no community did the burgess who conducted himself un-blameably live in an equally absolute security from the risk of encroachment on the part either of his fellow-burgesses or of the state itself.

These were the principles on which the community of Rome governed itself—a free people, understanding the duty of obedience, clearly disowning all mystical priestly delusion, absolutely equal in the eye of the law and one with another, bearing the sharply-defined impress of a nationality of their own, while at the same time (as will be afterwards shown) they wisely as well as magnanimously opened their gates wide for intercourse with other lands. This constitution was neither manufactured nor borrowed; it grew up amidst and along with the Roman people. It was based, of course, upon the earlier constitutions—the Italian, the Graeco-Italian, and the Indo-Germanic; but a long succession of phases of political development must have intervened between such constitutions as the poems of Homer and the Germania of Tacitus delineate and the oldest organization of the Roman community. In the acclamation of the Hellenic and in the shield-striking of the Germanic assemblies there was involved an expression of the sovereign power of the community; but a wide interval separated forms such as these from the organized jurisdiction and the regulated declaration of opinion of the Latin assembly of curies. It is possible, moreover, that as the Roman kings certainly borrowed the purple mantle and the ivory sceptre from the Greeks (not from the Etruscans), the twelve lictors also and various other external arrangements were introduced from abroad. But that the development of the Roman constitutional law belonged decidedly to Rome or, at any rate, to Latium, and that the borrowed elements in it are but small and unimportant, is clearly demonstrated by the fact that all its ideas are uniformly expressed by words of Latin coinage. This constitution practically established for all time the fundamental conceptions of the Roman state; for, as long as there existed a Roman community, in spite of changes of form it was always held that the magistrate had absolute command, that the council of elders was the highest authority in the state, and that every exceptional resolution required the sanction of the sovereign or, in other words, of the community of the people.

Notes for Book I Chapter V

Page 75

1. This was not merely the case under the old religious marriage (-matrimonium confarreatione-); the civil marriage also (-matrimonium consensu-), although not in itself giving to the husband proprietary power over his wife, opened up the way for his acquiring this proprietary power, inasmuch as the legal ideas of “formal delivery” (-coemptio-), and “prescription” (-usus-), were applied without ceremony to such a marriage. Till he acquired it, and in particular therefore during the period which elapsed before the completion of the prescription, the wife was (just as in the later marriage by -causae probatio-, until that took place), not -uxor-, but -pro uxore-. Down to the period when Roman jurisprudence became a completed system the principle maintained its ground, that the wife who was not in her husband’s power was not a married wife, but only passed as such (-uxor tantummodo habetur-. Cicero, Top. 3, 14).

2. The following epitaph, although belonging to a much later period, is not unworthy to have a place here. It is the stone that speaks:—

-Hospes, quod deico, paullum est. Asta ac pellige. Heic est sepulcrum haud pulcrum pulcrae feminae, Nomen parentes nominarunt Claudiam, Suum maritum corde dilexit sovo, Gnatos duos creavit, horum alterum In terra linquit, alium sub terra locat; Sermone lepidus, tum autem incessu commodus, Domum servavit, lanam fecit. Dixi. Abei.-

(Corp. Inscr. Lat. 1007.)

Still more characteristic, perhaps, is the introduction of wool-spinning among purely moral qualities; which is no very unusual occurrence in Roman epitaphs. Orelli, 4639: -optima et pulcherrima, lanifica pia pudica frugi casta domitida-. Orelli, 4861: -modestia probitate pudicitia obsequio lanificio diligentia fide par similisque ceteris probeis femina fuit-. Epitaph of Turia, i. 30: domestica bona pudicitiae, opsequi, comitatis, facilitatis, lanificiis [tuis adsiduitatis, religionis] sine superstitione, ornatus non conspiciendi, cultus modici.

3. I. III. Clan-villages

4. Dionysius affirms (v. 25) that lameness excluded from the supreme magistracy. That Roman citizenship was a condition for the regal office as well as for the consulate, is so very self-evident as to make it scarcely worth while to repudiate expressly the fictions respecting the burgess of Cures.

5. I. III. Clan-villages

6. Even in Rome, where the simple constitution of ten curies otherwise early disappeared, we still discover one practical application of it, and that singularly enough in the very same formality which we have other reasons for regarding as the oldest of all those that are mentioned in our legal traditions, the -confarreatio-. It seems scarcely

doubtful that the ten witnesses in that ceremony had the same relation to the constitution of ten curies the thirty lictors had to the constitution of thirty curies.

7. This is implied in their very name. The “part” (-tribus-) is, as jurists know, simply that which has once been or may hereafter come to be a whole, and so has no real standing of its own in the present.

Page 76

8. I. II. Primitive Races of Italy

9. -Quiris-, -quiritis-, or -quirinus- is interpreted by the ancients as “lance-bearer,” from -quiris- or -curis- = lance and -ire-, and so far in their view agrees with -samnis-, -samnitis- and -sabinus-, which also among the ancients was derived from —saunion—, spear. This etymology, which associates the word with -arquites-, -milites-, -pedites-, -equites-, -velites- —those respectively who go with the bow, in bodies of a thousand, on foot, on horseback, without armour in their mere over-garment—may be incorrect, but it is bound up with the Roman conception of a burgess. So too Juno quiritis, (Mars) quirinus, Janus quirinus, are conceived as divinities that hurl the spear; and, employed in reference to men, -quiris- is the warrior, that is, the full burgess. With this view the -usus loquendi- coincides. Where the locality was to be referred to, “Quirites” was never used, but always “Rome” and “Romans” (-urbs Roma-, -populus-, -civis-, -ager Romanus-), because the term -quiris- had as little of a local meaning as -civis- or -miles-. For the same reason these designations could not be combined; they did not say -civis quiris-, because both denoted, though from different points of view, the same legal conception. On the other hand the solemn announcement of the funeral of a burgess ran in the words “this warrior has departed in death” (-ollus quiris leto datus-); and in like manner the king addressed the assembled community by this name, and, when he sat in judgment, gave sentence according to the law of the warrior-freemen (-ex iure quiritorium-, quite similar to the later -ex iure civili-). The phrase -populus Romanus-, -quirites- (-populus Romanus quiritorium-is not sufficiently attested), thus means “the community and the individual burgesses,” and therefore in an old formula (Liv. i. 32) to the -populus Romanus- are opposed the -prisci Latini-, to the -quirites- the -homines prisci Latini- (Becker, Handb. ii. 20 seq.)

In the face of these facts nothing but ignorance of language and of history can still adhere to the idea that the Roman community was once confronted by a Quirite community of a similar kind, and that after their incorporation the name of the newly received community supplanted in ritual and legal phraseology that of the receiver.—Comp. iv. The Hill-Romans On The Quirinal, note.

10. Among the eight ritual institutions of Numa, Dionysius (ii. 64) after naming the Curiones and Flamines, specifies as the third the leaders of the horsemen (—oi eigemones ton Kelerion—). According to the Praenestine calendar a festival was celebrated at the Comitium on the 19th March [adstantibus pon]tificibus et trib(unis) celer(um). Valerius Antias (in Dionys. i. 13, comp. iii. 41) assigns to the earliest Roman cavalry a leader, Celer, and three centurions; whereas in the treatise De viris ill. i, Celer himself is termed -centurio-. Moreover Brutus is affirmed to have been -tribunus celerum-

Page 77

at the expulsion of the kings (Liv. i. 59), and according to Dionysius (iv. 71) to have even by virtue of this office made the proposal to banish the Tarquins. And, lastly, Pomponius (Dig. i. 2, 2, 15, 19) and Lydus in a similar way, partly perhaps borrowing from him (De Mag. i. 14, 37), identify the -tribunus celerum- with the Celer of Antias, the -magister equitum- of the dictator under the republic, and the -Praefectus praetorio- of the empire.

Of these—the only statements which are extant regarding the -tribuni celerum- —the last mentioned not only proceeds from late and quite untrustworthy authorities, but is inconsistent with the meaning of the term, which can only signify “divisional leaders of horsemen,” and above all the master of the horse of the republican period, who was nominated only on extraordinary occasions and was in later times no longer nominated at all, cannot possibly have been identical with the magistracy that was required for the annual festival of the 19th March and was consequently a standing office. Laying aside, as we necessarily must, the account of Pomponius, which has evidently arisen solely out of the anecdote of Brutus dressed up with ever-increasing ignorance as history, we reach the simple result that the -tribuni celerum- entirely correspond in number and character to the -tribuni militum-, and that they were the leaders-of-division of the horsemen, consequently quite distinct from the -magister equitum-.

11. This is indicated by the evidently very old forms -velites-and -arquites-and by the subsequent organization of the legion.

12. I. V. The King

13. I. IV. The Tibur and Its Traffic

14. -Lex- (“that which binds,” related to -legare-, “to bind to something”) denotes, as is well known, a contract in general, along, however, with the connotation of a contract whose terms the proposer dictates and the other party simply accepts or declines; as was usually the case, e. g. with public -licitationes-. In the -lex publica populi Romani- the proposer was the king, the acceptor the people; the limited co-operation of the latter was thus significantly indicated in the very language.

CHAPTER VI

The Non-Burgesses and the Reformed Constitution

Amalgamation of the Palatine and Quirinal Cities

The history of every nation, and of Italy more especially, is a —synoikismos— on a great scale. Rome, in the earliest form in which we have any knowledge of it, was

already triune, and similar incorporations only ceased when the spirit of Roman vigour had wholly died away. Apart from that primitive process of amalgamation of the Ramnes, Titles, and Luceres, of which hardly anything beyond the bare fact is known, the earliest act of incorporation of this sort was that by which the Hill-burgesses became merged in the Palatine Rome. The organization

Page 78

of the two communities, when they were about to be amalgamated, may be conceived to have been substantially similar; and in solving the problem of union they would have to choose between the alternatives of retaining duplicate institutions or of abolishing one set of these and extending the other to the whole united community. They adopted the former course with respect to all sanctuaries and priesthoods. Thenceforth the Roman community had its two guilds of Salii and two of Luperci, and as it had two forms of Mars, it had also two priests for that divinity—the Palatine priest, who afterwards usually took the designation of priest of Mars, and the Colline, who was termed priest of Quirinus. It is likely, although it can no longer be proved, that all the old Latin priesthoods of Rome—the Augurs, Pontifices, Vestals, and Fetials—originated in the same way from a combination of the priestly colleges of the Palatine and Quirinal communities. In the division into local regions the town on the Quirinal hill was added as a fourth region to the three belonging to the Palatine city, *viz.* the Suburan, Palatine, and suburban (-Esquiliae-). In the case of the original —synoikismos— the annexed community was recognized after the union as at least a tribe (part) of the new burgess-body, and thus had in some sense a continued political existence; but this course was not followed in the case of the Hill-Romans or in any of the later processes of annexation. After the union the Roman community continued to be divided as formerly into three tribes, each containing ten wardships (-curiae-); and the Hill-Romans—whether they were or were not previously distributed into tribes of their own—must have been inserted into the existing tribes and wardships. This insertion was probably so arranged that, while each tribe and wardship received its assigned proportion of the new burgesses, the new burgesses in these divisions were not amalgamated completely with the old; the tribes henceforth presented two ranks: the Tities, Ramnes, and Luceres being respectively subdivided into first and second (-piores-, -posteriores-). With this division was connected in all probability that arrangement of the organic institutions of the community in pairs, which meets us everywhere. The three pairs of Sacred Virgins are expressly described as representatives of the three tribes with their first and second ranks; and it may be conjectured that the pair of Lares worshipped in each street had a similar origin. This arrangement is especially apparent in the army: after the union each half-tribe of the tripartite community furnished a hundred horsemen, and the Roman burgess cavalry was thus raised to six “hundreds,” and the number of its captains probably from three to six. There is no tradition of any corresponding increase to the infantry; but to this origin we may refer the subsequent custom of calling out the legions regularly two by two, and this doubling of the levy probably led to the rule

Page 79

of having not three, as was perhaps originally the case, but six leaders-of-division to command the legion. It is certain that no corresponding increase of seats in the senate took place: on the contrary, the primitive number of three hundred senators remained the normal number down to the seventh century; with which it is quite compatible that a number of the more prominent men of the newly annexed community may have been received into the senate of the Palatine city. The same course was followed with the magistracies: a single king presided over the united community, and there was no change as to his principal deputies, particularly the warden of the city. It thus appears that the ritual institutions of the Hill-city were continued, and that the doubled burgess-body was required to furnish a military force of double the numerical strength; but in other respects the incorporation of the Quirinal city into the Palatine was really a subordination of the former to the latter. If we have rightly assumed that the contrast between the Palatine old and the Quirinal new burgesses was identical with the contrast between the first and second Tities, Ramnes, and Luceres, it was thus the -gentes-of the Quirinal city that formed the "second" or the "lesser." The distinction, however, was certainly more an honorary than a legal precedence. At the taking of the vote in the senate the senators taken from the old clans were asked before those of the "lesser." In like manner the Colline region ranked as inferior even to the suburban (Esquiline) region of the Palatine city; the priest of the Quirinal Mars as inferior to the priest of the Palatine Mars; the Quirinal Salii and Luperci as inferior to those of the Palatine. It thus appears that the —synoikismos—, by which the Palatine community incorporated that of the Quirinal, marked an intermediate stage between the earliest —synoikismos— by which the Tities, Ramnes, and Luceres became blended, and all those that took place afterwards. The annexed community was no longer allowed to form a separate tribe in the new whole, but it was permitted to furnish at least a distinct portion of each tribe; and its ritual institutions were not only allowed to subsist—as was afterwards done in other cases, after the capture of Alba for example—but were elevated into institutions of the united community, a course which was not pursued in any subsequent instance.

Dependents and Guests

This amalgamation of two substantially similar commonwealths produced rather an increase in the size than a change in the intrinsic character of the existing community. A second process of incorporation, which was carried out far more gradually and had far deeper effects, may be traced back, so far as the first steps in it are concerned, to this epoch; we refer to the amalgamation of the burgesses and the —metoeci—. At all times there existed side by side with the

Page 80

burgesses in the Roman community persons who were protected, the “listeners” (-clientes-), as they were called from their being dependents on the several burgess-households, or the “multitude” (-plebes-, from -pleo-, -plenus-), as they were termed negatively with reference to their want of political rights.(1) The elements of this intermediate stage between the freeman and the slave were, as has been shown(2) already in existence in the Roman household: but in the community this class necessarily acquired greater importance -de facto- and -de jure-, and that from two reasons. In the first place the community might itself possess half-free clients as well as slaves; especially after the conquest of a town and the breaking up of its commonwealth it might often appear to the conquering community advisable not to sell the mass of the burgesses formally as slaves, but to allow them the continued possession of freedom -de facto-, so that in the capacity as it were of freedmen of the community they entered into relations of clientship whether to the clans, or to the king. In the second place by means of the community and its power over the individual burgesses, there was given the possibility of protecting the clients against an abusive exercise of the -dominium- still subsisting in law. At an immemorially early period there was introduced into Roman law the principle on which rested the whole legal position of the —metoeci—, that, when a master on occasion of a public legal act—such as in the making of a testament, in an action at law, or in the census—expressly or tacitly surrendered his -dominium-, neither he himself nor his lawful successors should ever have power arbitrarily to recall that resignation or reassert a claim to the person of the freedman himself or of his descendants. The clients and their posterity did not by virtue of their position possess either the rights of burgesses or those of guests: for to constitute a burgess a formal bestowal of the privilege was requisite on the part of the community, while the relation of guest presumed the holding of burgess-rights in a community which had a treaty with Rome. What they did obtain was a legally protected possession of freedom, while they continued to be -de jure- non-free. Accordingly for a lengthened period their relations in all matters of property seem to have been, like those of slaves, regarded in law as relations of the patron, so that it was necessary that the latter should represent them in processes at law; in connection with which the patron might levy contributions from them in case of need, and call them to account before him criminally. By degrees, however, the body of —metoeci— outgrew these fetters; they began to acquire and to alienate in their own name, and to claim and obtain legal redress from the Roman burgess-tribunals without the formal intervention of their patron.

In matters of marriage and inheritance, equality of rights with the burgesses was far sooner conceded to foreigners(3) than to those who were strictly non-free and belonged to no community; but the latter could not well be prohibited from contracting marriages in their own circle and from forming the legal relations arising out of marriage—those of marital and paternal power, of -agnatio- and -gentilitas- of heritage and of tutelage—after the model of the corresponding relations among the burgesses.

Page 81

Similar consequences to some extent were produced by the exercise of the *-ius hospitii-*, in so far as by virtue of it foreigners settled permanently in Rome and established a domestic position there. In this respect the most liberal principles must have prevailed in Rome from primitive times. The Roman law knew no distinctions of quality in inheritance and no locking up of estates. It allowed on the one hand to every man capable of making a disposition the entirely unlimited disposal of his property during his lifetime; and on the other hand, so far as we know, to every one who was at all entitled to have dealings with Roman burgesses, even to the foreigner and the client, the unlimited right of acquiring moveable, and (from the time when immoveables could be held as private property at all) within certain limits also immoveable, estate in Rome. Rome was in fact a commercial city, which was indebted for the commencement of its importance to international commerce, and which with a noble liberality granted the privilege of settlement to every child of an unequal marriage, to every manumitted slave, and to every stranger who surrendering his rights in his native land emigrated to Rome.

Class of —Metoeci— Subsisting by the Side of the Community

At first, therefore, the burgesses were in reality the protectors, the non-burgesses were the protected; but in Rome as in all communities which freely admit settlement but do not throw open the rights of citizenship, it soon became a matter of increasing difficulty to harmonize this relation *-de jure-* with the actual state of things. The flourishing of commerce, the full equality of private rights guaranteed to all Latins by the Latin league (including even the acquisition of landed property), the greater frequency of manumissions as prosperity increased, necessarily occasioned even in peace a disproportionate increase of the number of —metoeci—. That number was further augmented by the greater part of the population of the neighbouring towns subdued by force of arms and incorporated with Rome; which, whether it removed to the city or remained in its old home now reduced to the rank of a village, ordinarily exchanged its native burgess-rights for those of a Roman —metoikos—. Moreover the burdens of war fell exclusively on the old burgesses and were constantly thinning the ranks of their patrician descendants, while the —metoeci— shared in the results of victory without having to pay for it with their blood.

Under such circumstances the only wonder is that the Roman patriciate did not disappear much more rapidly than it actually did. The fact of its still continuing for a prolonged period a numerous community can scarcely be accounted for by the bestowal of Roman burgess-rights on several distinguished foreign clans, which after emigrating from their homes or after the conquest of their cities received the Roman franchise—for

Page 82

such grants appear to have occurred but sparingly from the first, and to have become always the more rare as the franchise increased in value. A cause of greater influence, in all likelihood, was the introduction of the civil marriage, by which a child begotten of patrician parents living together as married persons, although without -*confarreatio*-, acquired full burgess-rights equally with the child of a -*confarreatio*- marriage. It is at least probable that the civil marriage, which already existed in Rome before the Twelve Tables but was certainly not an original institution, was introduced for the purpose of preventing the disappearance of the patriciate.(4) To this connection belong also the measures which were already in the earliest times adopted with a view to maintain a numerous posterity in the several households.(5)

Nevertheless the number of the —*metoeci*— was of necessity constantly on the increase and liable to no diminution, while that of the burgesses was at the utmost perhaps not decreasing; and in consequence the —*metoeci*— necessarily acquired by imperceptible degrees another and a freer position. The non-burgesses were no longer merely emancipated slaves or strangers needing protection; their ranks included the former burgesses of the Latin communities vanquished in war, and more especially the Latin settlers who lived in Rome not by the favour of the king or of any other burgess, but by federal right. Legally unrestricted in the acquiring of property, they gained money and estate in their new home, and bequeathed, like the burgesses, their homesteads to their children and children's children. The vexatious relation of dependence on particular burgess-households became gradually relaxed. If the liberated slave or the immigrant stranger still held an entirely isolated position in the state, such was no longer the case with his children, still less with his grandchildren, and this very circumstance of itself rendered their relations to the patron of less moment. While in earlier times the client was exclusively left dependent for legal protection on the intervention of the patron, the more the state became consolidated and the importance of the clanships and households in consequence diminished, the more frequently must the individual client have obtained justice and redress of injury, even without the intervention of his patron, from the king. A great number of the non-burgesses, particularly the members of the dissolved Latin communities, had, as we have already said, probably from the outset not any place as clients of the royal or other great clans, and obeyed the king nearly in the same manner as did the burgesses. The king, whose sovereignty over the burgesses was in truth ultimately dependent on the good-will of those obeying, must have welcomed the means of forming out of his own -*proteges*- essentially dependent on him a body bound to him by closer ties.

Plebs

Page 83

Thus there grew up by the side of the burgesses a second community in Rome: out of the clients arose the Plebs. This change of name is significant. In law there was no difference between the client and the plebeian, the “dependent” and the “man of the multitude;” but in fact there was a very important one, for the former term brought into prominence the relation of dependence on a member of the politically privileged class; the latter suggested merely the want of political rights. As the feeling of special dependence diminished, that of political inferiority forced itself on the thoughts of the free —metoeci—; and it was only the sovereignty of the king ruling equally over all that prevented the outbreak of political conflict between the privileged and the non-privileged classes.

The Servian Constitution

The first step, however, towards the amalgamation of the two portions of the people scarcely took place in the revolutionary way which their antagonism appeared to foreshadow. The reform of the constitution, which bears the name of king Servius Tullius, is indeed, as to its historical origin, involved in the same darkness with all the events of a period respecting which we learn whatever we know not by means of historical tradition, but solely by means of inference from the institutions of later times. But its character testifies that it cannot have been a change demanded by the plebeians, for the new constitution assigned to them duties alone, and not rights. It must rather have owed its origin either to the wisdom of one of the Roman kings, or to the urgency of the burgesses that they should be delivered from exclusive liability to burdens, and that the non-burgesses should be made to share on the one hand in taxation—that is, in the obligation to make advances to the state (the -tributum-)—and rendering task-work, and on the other hand in the levy. Both were comprehended in the Servian constitution, but they hardly took place at the same time. The bringing in of the non-burgesses presumably arose out of the economic burdens; these were early extended to such as were “possessed of means” (-locupletes-) or “settled people” (-adsidui-, freeholders), and only those wholly without means, the “children-producers” (-proletarii-, -capite censi-) remained free from them. Thereupon followed the politically more important step of bringing in the non-burgesses to military duty. This was thenceforth laid not upon the burgesses as such, but upon the possessors of land, the -tribules-, whether they might be burgesses or mere —metoeci—; service in the army was changed from a personal burden into a burden on property. The details of the arrangement were as follow.

The Five Classes

Page 84

Every freeholder from the eighteenth to the sixtieth year of his age, including children in the household of freeholder fathers, without distinction of birth, was under obligation of service, so that even the manumitted slave had to serve, if in an exceptional case he had come into possession of landed property. The Latins also possessing land—others from without were not allowed to acquire Roman soil—were called in to service, so far as they had, as was beyond doubt the case with most of them, taken up their abode on Roman territory. The body of men liable to serve was distributed, according to the size of their portions of land, into those bound to full service or the possessors of a full hide, (6) who were obliged to appear in complete armour and in so far formed pre-eminently the war army (-classis-), and the four following ranks of smaller landholders—the possessors respectively of three fourths, of a half, of a quarter, or of an eighth of a whole farm—from whom was required fulfilment of service, but not equipment in complete armour, and they thus had a position below the full rate (-infra classem-). As the land happened to be at that time apportioned, almost the half of the farms were full hides, while each of the classes possessing respectively three-fourths, the half, and the quarter of a hide, amounted to scarcely an eighth of the freeholders, and those again holding an eighth of a hide amounted to fully an eighth. It was accordingly laid down as a rule that in the case of the infantry the levy should be in the proportion of eighty holders of a full hide, twenty from each of the three next ranks, and twenty-eight from the last.

Cavalry

The cavalry was similarly dealt with. The number of divisions in it was tripled, and the only difference in this case was that the six divisions already existing with the old names (-Tities-, -Ramnes-, -Luceres- -primi- and -secundi-) were left to the patricians, while the twelve new divisions were formed chiefly from the non-burgesses. The reason for this difference is probably to be sought in the fact that at that period the infantry were formed anew for each campaign and discharged on their return home, whereas the cavalry with their horses were on military grounds kept together also in time of peace, and held their regular drills, which continued to subsist as festivals of the Roman equites down to the latest times.(7) Accordingly the squadrons once constituted were allowed, even under this reform, to keep their ancient names. In order to make the cavalry accessible to every burgess, the unmarried women and orphans under age, so far as they had possession of land, were bound instead of personal service to provide the horses for particular troopers (each trooper had two of them), and to furnish them with fodder. On the whole there was one horseman to nine foot-soldiers; but in actual service the horsemen were used more sparingly.

Page 85

The non-freeholders (-adcenti-, people standing at the side of the list of those owing military service) had to supply the army with workmen and musicians as well as with a number of substitutes who marched with the army unarmed (-velati-), and, when vacancies occurred in the field, took their places in the ranks equipped with the weapons of the sick or of the fallen.

Levy-Districts

To facilitate the levying of the infantry, the city was distributed into four “parts” (-tribus-); by which the old triple division was superseded, at least so far as concerned its local significance. These were the Palatine, which comprehended the height of that name along with the Velia; the Suburan, to which the street so named, the Carinae, and the Caelian belonged; the Esquiline; and the Colline, formed by the Quirinal and Viminal, the “hills” as contrasted with the “mounts” of the Capitol and Palatine. We have already spoken of the formation of these regions(8) and shown how they originated out of the ancient double city of the Palatine and the Quirinal. By what process it came to pass that every freeholder burgess belonged to one of those city-districts, we cannot tell; but this was now the case; and that the four regions were nearly on an equality in point of numbers, is evident from their being equally drawn upon in the levy. This division, which had primary reference to the soil alone and applied only inferentially to those who possessed it, was merely for administrative purposes, and in particular never had any religious significance attached to it; for the fact that in each of the city-districts there were six chapels of the enigmatical Argei no more confers upon them the character of ritual districts than the erection of an altar to the Lares in each street implies such a character in the streets.

Each of these four levy-districts had to furnish approximately the fourth part not only of the force as a whole, but of each of its military subdivisions, so that each legion and each century numbered an equal proportion of conscripts from each region, in order to merge all distinctions of a gentile and local nature in the one common levy of the community and, especially through the powerful levelling influence of the military spirit, to blend the —metoeci— and the burgesses into one people.

Organization of the Army

In a military point of view, the male population capable of bearing arms was divided into a first and second levy, the former of which, the “juniors” from the commencement of the eighteenth to the completion of the forty-sixth year, were especially employed for service in the field, while the “seniors” guarded the walls at home. The military unit came to be in the infantry the now doubled legion(9)—a phalanx, arranged and armed completely in the old Doric style, of 6000 men who, six file deep, formed

Page 86

a front of 1000 heavy-armed soldiers; to which were attached 2400 "unarmed".(10) The four first ranks of the phalanx, the -classis-, were formed by the fully-armed hoplites of those possessing a full hide; in the fifth and sixth were placed the less completely equipped farmers of the second and third division; the two last divisions were annexed as rear ranks to the phalanx or fought by its side as light-armed troops. Provision was made for readily supplying the accidental gaps which were so injurious to the phalanx. Thus there served in it 84 centuries or 8400 men, of whom 6000 were hoplites, 4000 of the first division, 1000 from each of the two following, and 2400 light-armed, of whom 1000 belonged to the fourth, and 1200 to the fifth division; approximately each levy-district furnished to the phalanx 2100, and to each century 25 men. This phalanx was the army destined for the field, while a like force of troops was reckoned for the seniors who remained behind to defend the city. In this way the normal amount of the infantry came to 16,800 men, 80 centuries of the first division, 20 from each of the three following, and 28 from the last division—not taking into account the two centuries of substitutes or those of the workmen or the musicians. To all these fell to be added the cavalry, which consisted of 1800 horse; often when the army took the field, however, only the third part of the whole number was attached to it. The normal amount of the Roman army of the first and second levy rose accordingly to close upon 20,000 men: which number must beyond doubt have corresponded on the whole to the effective strength of the Roman population capable of arms, as it stood at the time when this new organization was introduced. As the population increased the number of centuries was not augmented, but the several divisions were strengthened by persons added, without altogether losing sight, however, of the fundamental number. Indeed the Roman corporations in general, closed as to numbers, very frequently evaded the limit imposed upon them by admitting supernumerary members.

Census

This new organization of the army was accompanied by a more careful supervision of landed property on the part of the state. It was now either ordained for the first time or, if not, at any rate defined more carefully, that a land-register should be established, in which the several proprietors of land should have their fields with all their appurtenances, servitudes, slaves, beasts of draught and of burden, duly recorded. Every act of alienation, which did not take place publicly and before witnesses, was declared null; and a revision of the register of landed property, which was at the same time the levy-roll, was directed to be made every fourth year. The -mancipatio- and the -census- thus arose out of the Servian military organization.

Political Effects of the Servian Military Organization

Page 87

It is evident at a glance that this whole institution was from the outset of a military nature. In the whole detailed scheme we do not encounter a single feature suggestive of any destination of the centuries to other than purely military purposes; and this alone must, with every one accustomed to consider such matters, form a sufficient reason for pronouncing its application to political objects a later innovation. If, as is probable, in the earliest period every one who had passed his sixtieth year was excluded from the centuries, this has no meaning, so far as they were intended from the first to form a representation of the burgess-community similar to and parallel with the curies. Although, however, the organization of the centuries was introduced merely to enlarge the military resources of the burgesses by the inclusion of the —metoeci— and, in so far, there is no greater error than to exhibit the Servian organization as the introduction of a timocracy in Rome—yet the new obligation imposed upon the inhabitants to bear arms exercised in its consequences a material influence on their political position. He who is obliged to become a soldier must also, so long as the state is not rotten, have it in his power to become an officer; beyond question plebeians also could now be nominated in Rome as centurions and as military tribunes. Although, moreover, the institution of the centuries was not intended to curtail the political privileges exclusively possessed by the burgesses as hitherto represented in the curies, yet it was inevitable that those rights, which the burgesses hitherto had exercised not as the assembly of curies, but as the burgess-levy, should pass over to the new centuries of burgesses and —metoeci—. Henceforward, accordingly, it was the centuries whose consent the king had to ask before beginning an aggressive war.⁽¹¹⁾ It is important, on account of the subsequent course of development, to note these first steps towards the centuries taking part in public affairs; but the centuries came to acquire such rights at first more in the way of natural sequence than of direct design, and subsequently to the Servian reform, as before, the assembly of the curies was regarded as the proper burgess-community, whose homage bound the whole people in allegiance to the king. By the side of these new landowning full-burgesses stood the domiciled foreigners from the allied Latium, as participating in the public burdens, tribute and task-works (hence -municipes-); while the burgesses not domiciled, who were beyond the pale of the tribes, and had not the right to serve in war and vote, came into view only as “owing tribute” (-aerarii-).

In this way, while hitherto there had been distinguished only two classes of members of the community, burgesses and clients, there were now established those three political classes, which exercised a dominant influence over the constitutional law of Rome for many centuries.

Page 88

Time and Occasion of the Reform

When and how this new military organization of the Roman community came into existence, can only be conjectured. It presupposes the existence of the four regions; in other words, the Servian wall must have been erected before the reform took place. But the territory of the city must also have considerably exceeded its original limits, when it could furnish 8000 holders of full hides and as many who held lesser portions, or sons of such holders. We are not acquainted with the superficial extent of the normal Roman farm; but it is not possible to estimate it as under twenty -jugera-.(12) If we reckon as a minimum 10,000 full hides, this would imply a superficies of 190 square miles of arable land; and on this calculation, if we make a very moderate allowance for pasture, the space occupied by houses, and ground not capable of culture, the territory, at the period when this reform was carried out, must have had at least an extent of 420 square miles, probably an extent still more considerable. If we follow tradition, we must assume a number of 84,000 burgesses who were freeholders and capable of bearing arms; for such, we are told, were the numbers ascertained by Servius at the first census. A glance at the map, however, shows that this number must be fabulous; it is not even a genuine tradition, but a conjectural calculation, by which the 16,800 capable of bearing arms who constituted the normal strength of the infantry appeared to yield, on an average of five persons to each family, the number of 84,000 burgesses, and this number was confounded with that of those capable of bearing arms. But even according to the more moderate estimates laid down above, with a territory of some 16,000 hides containing a population of nearly 20,000 capable of bearing arms and at least three times that number of women, children, and old men, persons who had no land, and slaves, it is necessary to assume not merely that the region between the Tiber and Anio had been acquired, but that the Alban territory had also been conquered, before the Servian constitution was established; a result with which tradition agrees. What were the numerical proportions of patricians and plebeians originally in the army, cannot be ascertained.

Upon the whole it is plain that this Servian institution did not originate in a conflict between the orders. On the contrary, it bears the stamp of a reforming legislator like the constitutions of Lycurgus, Solon, and Zaleucus; and it has evidently been produced under Greek influence. Particular analogies may be deceptive, such as the coincidence noticed by the ancients that in Corinth also widows and orphans were charged with the provision of horses for the cavalry; but the adoption of the armour and arrangements of the Greek hoplite system was certainly no accidental coincidence. Now if we consider the fact that it was in the second century of the city that the

Page 89

Greek states in Lower Italy advanced from the pure clan-constitution to a modified one, which placed the preponderance in the hands of the landholders, we shall recognize in that movement the impulse which called forth in Rome the Servian reform—a change of constitution resting in the main on the same fundamental idea, and only directed into a somewhat different course by the strictly monarchical form of the Roman state.(13)

Notes for Book I Chapter VI

1. I. V. Dependents of the Household
2. -Habuit plebem in clientelas principum descriptam-. Cicero, de Rep. ii. 9.
3. I. III. The Latin League
4. The enactments of the Twelve Tables respecting -usus- show clearly that they found the civil marriage already in existence. In like manner the high antiquity of the civil marriage is clearly evident from the fact that it, equally with the religious marriage, necessarily involved the marital power (v. The House-father and His Household), and only differed from the religious marriage as respected the manner in which that power was acquired. The religious marriage itself was held as the proprietary and legally necessary form of acquiring a wife; whereas, in the case of civil marriage, one of the general forms of acquiring property used on other occasions—delivery on the part of a person entitled to give away, or prescription—was requisite in order to lay the foundation of a valid marital power.

6. -Hufe-, hide, as much as can be properly tilled with one plough, called in Scotland a plough-gate.
7. For the same reason, when the levy was enlarged after the admission of the Hill-Romans, the equites were doubled, while in the infantry force instead of the single “gathering” (-legio-) two legions were called out (vi. Amalgamation of the Palatine and Quirinal Cities).
8. I. IV. Oldest Settlements In the Palatine and Suburan Regions
9. I. V. Burdens of the Burgesses
10. -velites-, see v. Burdens of the Burgesses, note
11. I. V. Rights of the Burgesses

12. Even about 480, allotments of land of seven -jugera- appeared to those that received them small (Val. Max. iii. 3, 5; Colum. i, praef. 14; i. 3, ii; Plin. H. N. xviii. 3, 18: fourteen -jugera-, Victor, 33; Plutarch, Apophth. Reg. et Imp. p. 235 Dubner, in accordance with which Plutarch, Crass. 2, is to be corrected).

A comparison of the Germanic proportions gives the same result. The -jugerum- and the -morgen- [nearly $\frac{5}{8}$ of an English acre], both originally measures rather of labour than of surface, may be looked upon as originally identical. As the German hide consisted ordinarily of 30, but not unfrequently of 20 or 40 -morgen-, and the homestead frequently, at least among the Anglo-Saxons, amounted to a tenth of the hide, it will appear, taking into account the diversity of climate and the size of the Roman -heredium- of 2 -jugera-, that the hypothesis of a Roman hide of 20 -jugera- is not unsuitable to the circumstances of the case. It is to be regretted certainly that on this very point tradition leaves us without precise information.

Page 90

13. The analogy also between the so-called Servian constitution and the treatment of the Attic —metoeci— deserves to be particularly noticed. Athens, like Rome, opened her gates at a comparatively early period to the —metoeci—, and afterwards summoned them also to share the burdens of the state. We cannot suppose that any direct connection existed in this instance between Athens and Rome; but the coincidence serves all the more distinctly to show how the same causes—urban centralization and urban development—everywhere and of necessity produce similar effects.

CHAPTER VII

The Hegemony of Rome in Latium

Extension of the Roman Territory

The brave and impassioned Italian race doubtless never lacked feuds among themselves and with their neighbours: as the country flourished and civilization advanced, feuds must have become gradually changed into war and raids for pillage into conquest, and political powers must have begun to assume shape. No Italian Homer, however, has preserved for us a picture of these earliest frays and plundering excursions, in which the character of nations is moulded and expressed like the mind of the man in the sports and enterprises of the boy; nor does historical tradition enable us to form a judgment, with even approximate accuracy, as to the outward development of power and the comparative resources of the several Latin cantons. It is only in the case of Rome, at the utmost, that we can trace in some degree the extension of its power and of its territory. The earliest demonstrable boundaries of the united Roman community have been already stated;(1) in the landward direction they were on an average just about five miles distant from the capital of the canton, and it was only toward the coast that they extended as far as the mouth of the Tiber (-Ostia-), at a distance of somewhat more than fourteen miles from Rome. "The new city," says Strabo, in his description of the primitive Rome, "was surrounded by larger and smaller tribes, some of whom dwelt in independent villages and were not subordinate to any national union." It seems to have been at the expense of these neighbours of kindred lineage in the first instance that the earliest extensions of the Roman territory took place.

Territory on the Anio—Alba

The Latin communities situated on the upper Tiber and between the Tiber and the Anio-Antemnae, Crustumerium, Ficulnea, Medullia, Caenina, Corniculum, Cameria, Collatia, —were those which pressed most closely and sorely on Rome, and they appear to have

forfeited their independence in very early times to the arms of the Romans. The only community that subsequently appears as independent in this district was Nomentum; which perhaps saved its freedom by alliance with Rome. The possession of Fidenae, the -tete

Page 91

de pont- of the Etruscans on the left bank of the Tiber, was contested between the Latins and the Etruscans—in other words, between the Romans and Veientes—with varying results. The struggle with Gabii, which held the plain between the Anio and the Alban hills, was for a long period equally balanced: down to late times the Sabine dress was deemed synonymous with that of war, and Sabine ground the prototype of hostile soil.(2) By these conquests the Roman territory was probably extended to about 190 square miles. Another very early achievement of the Roman arms was preserved, although in a legendary dress, in the memory of posterity with greater vividness than those obsolete struggles: Alba, the ancient sacred metropolis of Latium, was conquered and destroyed by Roman troops. How the collision arose, and how it was decided, tradition does not tell: the battle of the three Roman with the three Alban brothers born at one birth is nothing but a personification of the struggle between two powerful and closely related cantons, of which the Roman at least was triune. We know nothing at all beyond the naked fact of the subjugation and destruction of Alba by Rome.(3)

It is not improbable, although wholly a matter of conjecture, that, at the same period when Rome was establishing herself on the Anio and on the Alban hills, Praeneste, which appears at a later date as mistress of eight neighbouring townships, Tibur, and others of the Latin communities were similarly occupied in enlarging their territory and laying the foundations of their subsequent far from inconsiderable power.

Treatment of the Earliest Acquisitions

We feel the want of accurate information as to the legal character and legal effects of these early Latin conquests, still more than we miss the records of the wars in which they were won. Upon the whole it is not to be doubted that they were treated in accordance with the system of incorporation, out of which the tripartite community of Rome had arisen; excepting that the cantons who were compelled by arms to enter the combination did not, like the primitive three, preserve some sort of relative independence as separate regions in the new united community, but became so entirely merged in the general whole as to be no longer traced.(4) However far the power of a Latin canton might extend, in the earliest times it tolerated no political centre except the proper capital; and still less founded independent settlements, such as the Phoenicians and the Greeks established, thereby creating in their colonies clients for the time being and future rivals to the mother city. In this respect, the treatment which Ostia experienced from Rome deserves special notice: the Romans could not and did not wish to prevent the rise -de facto- of a town at that spot, but they allowed the place no political independence, and accordingly they did not bestow on those who settled

Page 92

there any local burgess-rights, but merely allowed them to retain, if they already possessed, the general burgess-rights of Rome.(5) This principle also determined the fate of the weaker cantons, which by force of arms or by voluntary submission became subject to a stronger. The stronghold of the canton was razed, its domain was added to the domain of the conquerors, and a new home was instituted for the inhabitants as well as for their gods in the capital of the victorious canton. This must not be understood absolutely to imply a formal transportation of the conquered inhabitants to the new capital, such as was the rule at the founding of cities in the East. The towns of Latium at this time can have been little more than the strongholds and weekly markets of the husbandmen: it was sufficient in general that the market and the seat of justice should be transferred to the new capital. That even the temples often remained at the old spot is shown in the instances of Alba and of Caenina, towns which must still after their destruction have retained some semblance of existence in connection with religion. Even where the strength of the place that was razed rendered it really necessary to remove the inhabitants, they would be frequently settled, with a view to the cultivation of the soil, in the open hamlets of their old domain. That the conquered, however, were not unfrequently compelled either as a whole or in part to settle in their new capital, is proved, more satisfactorily than all the several stories from the legendary period of Latium could prove it, by the maxim of Roman state-law, that only he who had extended the boundaries of the territory was entitled to advance the wall of the city (the -pomerium-). Of course the conquered, whether transferred or not, were ordinarily compelled to occupy the legal position of clients;(6) but particular individuals or clans occasionally had burgess-rights or, in other words, the patriciate conferred upon them. In the time of the empire there were still recognized Alban clans which were introduced among the burgesses of Rome after the fall of their native seat; amongst these were the Julii, Servilii, Quinctilii, Cloelii, Geganii, Curiatii, Metilii: the memory of their descent was preserved by their Alban family shrines, among which the sanctuary of the -gens- of the Julii at Bovillae again rose under the empire into great repute.

This centralizing process, by which several small communities became absorbed in a larger one, of course was far from being an idea specially Roman. Not only did the development of Latium and of the Sabellian stocks hinge upon the distinction between national centralization and cantonal independence; the case was the same with the development of the Hellenes. Rome in Latium and Athens in Attica arose out of a like amalgamation of many cantons into one state; and the wise Thales suggested a similar fusion to the hard-pressed league of the Ionic cities as the only means of saving their nationality. But Rome adhered to this principle of unity with more consistency, earnestness, and success than any other Italian canton; and just as the prominent position of Athens in Hellas was the effect of her early centralization, so Rome was indebted for her greatness solely to the same system, in her case far more energetically applied,

Page 93

The Hegemony of Rome over Latium—Alba

While the conquests of Rome in Latium may be mainly regarded as direct extensions of her territory and people presenting the same general features, a further and special significance attached to the conquest of Alba. It was not merely the problematical size and presumed riches of Alba that led tradition to assign a prominence so peculiar to its capture. Alba was regarded as the metropolis of the Latin confederacy, and had the right of presiding among the thirty communities that belonged to it. The destruction of Alba, of course, no more dissolved the league itself than the destruction of Thebes dissolved the Boeotian confederacy;(7) but, in entire consistency with the strict application of the *-ius privatum-* which was characteristic of the Latin laws of war, Rome now claimed the presidency of the league as the heir-at-law of Alba. What sort of crises, if any, preceded or followed the acknowledgment of this claim, we cannot tell. Upon the whole the hegemony of Rome over Latium appears to have been speedily and generally recognized, although particular communities, such as Labici and above all Gabii, may for a time have declined to own it. Even at that time Rome was probably a maritime power in contrast to the Latin "land," a city in contrast to the Latin villages, and a single state in contrast to the Latin confederacy; even at that time it was only in conjunction with and by means of Rome that the Latins could defend their coasts against Carthaginians, Hellenes, and Etruscans, and maintain and extend their landward frontier in opposition to their restless neighbours of the Sabellian stock. Whether the accession to her material resources which Rome obtained by the subjugation of Alba was greater than the increase of her power obtained by the capture of Antemnae or Collatia, cannot be ascertained: it is quite possible that it was not by the conquest of Alba that Rome was first constituted the most powerful community in Latium; she may have been so long before; but she did gain in consequence of that event the presidency at the Latin festival, which became the basis of the future hegemony of the Roman community over the whole Latin confederacy. It is important to indicate as definitely as possible the nature of a relation so influential.

Relation of Rome to Latium

The form of the Roman hegemony over Latium was, in general, that of an alliance on equal terms between the Roman community on the one hand and the Latin confederacy on the other, establishing a perpetual peace throughout the whole domain and a perpetual league for offence and defence. "There shall be peace between the Romans and all communities of the Latins, as long as heaven and earth endure; they shall not wage war with each other, nor call enemies into the land, nor grant passage to enemies: help shall

Page 94

be rendered by all in concert to any community assailed, and whatever is won in joint warfare shall be equally distributed.” The stipulated equality of rights in trade and exchange, in commercial credit and in inheritance, tended, by the manifold relations of business intercourse to which it led, still further to interweave the interests of communities already connected by the ties of similar language and manners, and in this way produced an effect somewhat similar to that of the abolition of customs-restrictions in our own day. Each community certainly retained in form its own law: down to the time of the Social war Latin law was not necessarily identical with Roman: we find, for example, that the enforcing of betrothal by action at law, which was abolished at an early period in Rome, continued to subsist in the Latin communities. But the simple and purely national development of Latin law, and the endeavour to maintain as far as possible uniformity of rights, led at length to the result, that the law of private relations was in matter and form substantially the same throughout all Latium. This uniformity of rights comes most distinctly into view in the rules laid down regarding the loss and recovery of freedom on the part of the individual burgess. According to an ancient and venerable maxim of law among the Latin stock no burgess could become a slave in the state wherein he had been free, or suffer the loss of his burgess-rights while he remained within it: if he was to be punished with the loss of freedom and of burgess-rights (which was the same thing), it was necessary that he should be expelled from the state and should enter on the condition of slavery among strangers. This maxim of law was now extended to the whole territory of the league; no member of any of the federal states might live as a slave within the bounds of the league. Applications of this principle are seen in the enactment embodied in the Twelve Tables, that the insolvent debtor, in the event of his creditor wishing to sell him, must be sold beyond the boundary of the Tiber, in other words, beyond the territory of the league; and in the clause of the second treaty between Rome and Carthage, that an ally of Rome who might be taken prisoner by the Carthaginians should be free so soon as he entered a Roman seaport. Although there did not probably subsist a general intercommunion of marriage within the league, yet, as has been already remarked(8) intermarriage between the different communities frequently occurred. Each Latin could primarily exercise political rights only where he was enrolled as a burgess; but on the other hand it was implied in an equality of private rights, that any Latin could take up his abode in any place within the Latin bounds; or, to use the phraseology of the present day, there existed, side by side with the special burgess-rights of the individual communities, a general right of settlement co-extensive with the confederacy; and, after the plebeian was

Page 95

acknowledged in Rome as a burgess, this right became converted as regards Rome into full freedom of settlement. It is easy to understand how this should have turned materially to the advantage of the capital, which alone in Latium offered the means of urban intercourse, urban acquisition, and urban enjoyments; and how the number of —metoeci— in Rome should have increased with remarkable rapidity, after the Latin land came to live in perpetual peace with Rome.

In constitution and administration the several communities not only remained independent and sovereign, so far as the federal obligations did not interfere, but, what was of more importance, the league of the thirty communities as such retained its autonomy in contradistinction to Rome. When we are assured that the position of Alba towards the federal communities was a position superior to that of Rome, and that on the fall of Alba these communities attained autonomy, this may well have been the case, in so far as Alba was essentially a member of the league, while Rome from the first had rather the position of a separate state confronting the league than of a member included in it; but, just as the states of the confederation of the Rhine were formally sovereign, while those of the German empire had a master, the presidency of Alba may have been in reality an honorary right⁽⁹⁾ like that of the German emperors, and the protectorate of Rome from the first a supremacy like that of Napoleon. In fact Alba appears to have exercised the right of presiding in the federal council, while Rome allowed the Latin deputies to hold their consultations by themselves under the guidance, as it appears, of a president selected from their own number, and contented herself with the honorary presidency at the federal festival where sacrifice was offered for Rome and Latium, and with the erection of a second federal sanctuary in Rome—the temple of Diana on the Aventine—so that thenceforth sacrifice was offered both on Roman soil for Rome and Latium, and on Latin soil for Latium and Rome. With equal deference to the interests of the league the Romans in the treaty with Latium bound themselves not to enter into a separate alliance with any Latin community—a stipulation which very clearly reveals the apprehensions entertained, doubtless not without reason, by the confederacy with reference to the powerful community taking the lead. The position of Rome not within, but alongside of Latium, is most clearly apparent in the arrangements for warfare. The fighting force of the league was composed, as the later mode of making the levy incontrovertibly shows, of two masses of equal strength, a Roman and a Latin. The supreme command lay once for all with the Roman generals; year by year the Latin contingent had to appear before the gates of Rome, and there saluted the elected commander by acclamation as its general, after the Romans commissioned by the Latin federal council to take the auspices

Page 96

had thereby assured themselves of the contentment of the gods with the choice that had been made. Whatever land or property was acquired in the wars of the league was apportioned among its members according to the judgment of the Romans. That the Romano-Latin federation was represented as regards its external relations solely by Rome, cannot with certainty be maintained. The federal agreement did not prohibit either Rome or Latium from undertaking an aggressive war on their own behoof; and if a war was waged by the league, whether pursuant to a resolution of its own or in consequence of a hostile attack, the Latin federal council may have been legally entitled to take part in the conduct as well as in the termination of the war. Practically indeed Rome must have possessed the hegemony even then, for, wherever a single state and a federation enter into a permanent connection with each other, the preponderance usually falls to the side of the former.

Extension of the Roman Territory after the Fall of Alba—Hernici—Rutulli and Volscii

The steps by which after the fall of Alba Rome—now mistress of a territory comparatively considerable, and presumably the leading power in the Latin confederacy—extended still further her direct and indirect dominion, can no longer be traced. There was no lack of feuds with the Etruscans and with the Veientes in particular, chiefly respecting the possession of Fidenae; but it does not appear that the Romans were successful in acquiring permanent mastery over that Etruscan outpost, which was situated on the Latin bank of the river not much more than five miles from Rome, or in dislodging the Veientes from that formidable basis of offensive operations. On the other hand they maintained apparently undisputed possession of the Janiculum and of both banks of the mouth of the Tiber. As regards the Sabines and Aequi Rome appears in a more advantageous position; the connection which afterwards became so intimate with the more distant Hernici must have had at least its beginning under the monarchy, and the united Latins and Hernici enclosed on two sides and held in check their eastern neighbours. But on the south frontier the territory of the Rutuli and still more that of the Volsci were scenes of perpetual war. The earliest extension of the Latin land took place in this direction, and it is here that we first encounter those communities founded by Rome and Latium on the enemy's soil and constituted as autonomous members of the Latin confederacy—the Latin colonies, as they were called—the oldest of which appear to reach back to the regal period. How far, however, the territory reduced under the power of the Romans extended at the close of the monarchy, can by no means be determined. Of feuds with the neighbouring Latin and Volscian communities the Roman annals of the regal period recount more than enough; but only a few detached notices, such as that

Page 97

perhaps of the capture of Suessa in the Pomptine plain, can be held to contain a nucleus of historical fact. That the regal period laid not only the political foundations of Rome, but the foundations also of her external power, cannot be doubted; the position of the city of Rome as contradistinguished from, rather than forming part of, the league of Latin states is already decidedly marked at the beginning of the republic, and enables us to perceive that an energetic development of external power must have taken place in Rome during the time of the kings. Certainly great deeds, uncommon achievements have in this case passed into oblivion; but the splendour of them lingers over the regal period of Rome, especially over the royal house of the Tarquins, like a distant evening twilight in which outlines disappear.

Enlargement of the City of Rome—Servian Wall

While the Latin stock was thus tending towards union under the leadership of Rome and was at the same time extending its territory on the east and south, Rome itself, by the favour of fortune and the energy of its citizens, had been converted from a stirring commercial and rural town into the powerful capital of a flourishing country. The remodelling of the Roman military system and the political reform of which it contained the germ, known to us by the name of the Servian constitution, stand in intimate connection with this internal change in the character of the Roman community. But externally also the character of the city cannot but have changed with the influx of ampler resources, with the rising requirements of its position, and with the extension of its political horizon. The amalgamation of the adjoining community on the Quirinal with that on the Palatine must have been already accomplished when the Servian reform, as it is called, took place; and after this reform had united and consolidated the military strength of the community, the burgesses could no longer rest content with entrenching the several hills, as one after another they were filled with buildings, and with possibly also keeping the island in the Tiber and the height on the opposite bank occupied so that they might command the course of the river. The capital of Latium required another and more complete system of defence; they proceeded to construct the Servian wall. The new continuous city-wall began at the river below the Aventine, and included that hill, on which there have been brought to light recently (1855) at two different places, the one on the western slope towards the river, the other on the opposite eastern slope, colossal remains of those primitive fortifications—portions of wall as high as the walls of Alatri and Ferentino, built of large square hewn blocks of tufo in courses of unequal height—emerging as it were from the tomb to testify to the might of an epoch, whose buildings subsist imperishably in these walls of rock, and whose intellectual achievements will continue

Page 98

to exercise an influence more lasting even than these. The ring-wall further embraced the Caelian and the whole space of the Esquiline, Viminal, and Quirinal, where a structure likewise but recently brought to light on a great scale (1862)—on the outside composed of blocks of peperino and protected by a moat in front, on the inside forming a huge earthen rampart sloped towards the city and imposing even at the present day—supplied the want of natural means of defence. From thence it ran to the Capitoline, the steep declivity of which towards the Campus Martius served as part of the city-wall, and it again abutted on the river above the island in the Tiber. The Tiber island with the bridge of piles and the Janiculum did not belong strictly to the city, but the latter height was probably a fortified outwork. Hitherto the Palatine had been the stronghold, but now this hill was left open to be built upon by the growing city; and on the other hand upon the Tarpeian Hill, standing free on every side, and from its moderate extent easily defensible, there was constructed the new “stronghold” (-arx-, -capitolium-(10)), containing the stronghold-spring, the carefully enclosed “well-house” (-tullianum-), the treasury (-aerarium-), the prison, and the most ancient place of assemblage for the burgesses (-area Capitolina-), where still in after times the regular announcements of the changes of the moon continued to be made. Private dwellings of a permanent kind, on the other hand, were not tolerated in earlier times on the stronghold-hill;(11) and the space between the two summits of the hill, the sanctuary of the evil god (-Ve-diovis-), or as it was termed in the later Hellenizing epoch, the Asylum, was covered with wood and presumably intended for the reception of the husbandmen and their herds, when inundation or war drove them from the plain. The Capitol was in reality as well as in name the Acropolis of Rome, an independent castle capable of being defended even after the city had fallen: its gate lay probably towards what was afterwards the Forum. (12) The Aventine seems to have been fortified in a similar style, although less strongly, and to have been preserved free from permanent occupation. With this is connected the fact, that for purposes strictly urban, such as the distribution of the introduced water, the inhabitants of Rome were divided into the inhabitants of the city proper (-montani-), and those of the districts situated within the general ring-wall, but yet not reckoned as strictly belonging to the city (-pagani Aventinensis-, -Ianiculenses-, -collegia Capitolinorum et Mercurialium-).(13) The space enclosed by the new city wall thus embraced, in addition to the former Palatine and Quirinal cities, the two federal strongholds of the Capitol and the Aventine, and also the Janiculum;(14) the Palatine, as the oldest and proper city, was enclosed by the other heights along which the wall was carried, as if encircled with a wreath, and the two castles occupied the middle.

Page 99

The work, however, was not complete so long as the ground, protected by so laborious exertions from outward foes, was not also reclaimed from the dominion of the water, which permanently occupied the valley between the Palatine and the Capitol, so that there was perhaps even a ferry there, and which converted the valleys between the Capitol and the Velia and between the Palatine and the Aventine into marshes. The subterranean drains still existing at the present day, composed of magnificent square blocks, which excited the astonishment of posterity as a marvellous work of regal Rome, must rather be reckoned to belong to the following epoch, for travertine is the material employed and we have many accounts of new structures of the kind in the times of the republic; but the scheme itself belongs beyond doubt to the regal period, although presumably to a later epoch than the designing of the Servian wall and the Capitoline stronghold. The spots thus drained or dried supplied large open spaces such as were needed by the new enlarged city. The assembling-place of the community, which had hitherto been the Area Capitolina at the stronghold itself, was now transferred to the flat space, where the ground fell from the stronghold towards the city (-comitium-), and which stretched thence between the Palatine and the Carinae, in the direction of the Velia. At that side of the -comitium- which adjoined the stronghold, and upon the stronghold-wall which arose above the -comitium- in the fashion of a balcony, the members of the senate and the guests of the city had the place of honour assigned to them on occasion of festivals and assemblies of the people; and at the place of assembly itself was erected the senate-house, which afterwards bore the name of the Curia Hostilia. The platform for the judgment-seat (-tribunal-), and the stage whence the burgesses were addressed (the later rostra), were likewise erected on the -comitium- itself. Its prolongation in the direction of the Velia became the new market (-forum Romanum-). At the end of the latter, beneath the Palatine, rose the community-house, which included the official dwelling of the king (-regia-) and the common hearth of the city, the rotunda forming the temple of Vesta; at no great distance, on the south side of the Forum, there was erected a second round building connected with the former, the store-room of the community or temple of the Penates, which still stands at the present day as the porch of the church Santi Cosma e Damiano. It is a feature significant of the new city now united in a way very different from the settlement of the "seven mounts," that, over and above the hearths of the thirty curies which the Palatine Rome had been content with associating in one building, the Servian Rome presented this general and single hearth for the city at large.⁽¹⁵⁾ Along the two longer sides of the Forum butchers' shops and other traders' stalls were arranged. In the valley between the Palatine and Aventine a

Page 100

“ring” was staked off for races; this became the Circus. The cattle-market was laid out immediately adjoining the river, and this soon became one of the most densely peopled quarters of Rome. Temples and sanctuaries arose on all the summits, above all the federal sanctuary of Diana on the Aventine,(16) and on the summit of the stronghold the far-seen temple of Father Diovis, who had given to his people all this glory, and who now, when the Romans were triumphing over the surrounding nations, triumphed along with them over the subject gods of the vanquished.

The names of the men, at whose bidding these great buildings of the city arose, are almost as completely lost in oblivion as those of the leaders in the earliest battles and victories of Rome. Tradition indeed assigns the different works to different kings—the senate-house to Tullus Hostilius, the Janiculum and the wooden bridge to Ancus Marcius, the great Cloaca, the Circus, and the temple of Jupiter to the elder Tarquinius, the temple of Diana and the ring-wall to Servius Tullius. Some of these statements may perhaps be correct; and it is apparently not the result of accident that the building of the new ring-wall is associated both as to date and author with the new organization of the army, which in fact bore special reference to the regular defence of the city walls. But upon the whole we must be content to learn from this tradition—what is indeed evident of itself—that this second creation of Rome stood in intimate connection with the commencement of her hegemony over Latium and with the remodelling of her burges-army, and that, while it originated in one and the same great conception, its execution was not the work either of a single man or of a single generation. It is impossible to doubt that Hellenic influences exercised a powerful effect on this remodelling of the Roman community, but it is equally impossible to demonstrate the mode or the degree of their operation. It has already been observed that the Servian military constitution is essentially of an Hellenic type;(17) and it will be afterwards shown that the games of the Circus were organized on an Hellenic model. The new -regia-with the city hearth was quite a Greek —prytaneion—, and the round temple of Vesta, looking towards the east and not so much as consecrated by the augurs, was constructed in no respect according to Italian, but wholly in accordance with Hellenic, ritual. With these facts before us, the statement of tradition appears not at all incredible that the Ionian confederacy in Asia Minor to some extent served as a model for the Romano-Latin league, and that the new federal sanctuary on the Aventine was for that reason constructed in imitation of the Artemision at Ephesus.

Notes for Book I Chapter VII

1. I. IV. Earliest Limits of the Roman Territory

Page 101

2. The formulae of accursing for Gabii and Fidenae are quite as characteristic (Macrob. Sat. iii. 9). It cannot, however, be proved and is extremely improbable that, as respects these towns, there was an actual historical accursing of the ground on which they were built, such as really took place at Veii, Carthage, and Fregellae. It may be conjectured that old accursing formularies were applied to those two hated towns, and were considered by later antiquaries as historical documents.

3. But there seems to be no good ground for the doubt recently expressed in a quarter deserving of respect as to the destruction of Alba having really been the act of Rome. It is true, indeed, that the account of the destruction of Alba is in its details a series of improbabilities and impossibilities; but that is true of every historical fact inwoven into legend. To the question as to the attitude of the rest of Latium towards the struggle between Rome and Alba, we are unable to give an answer; but the question itself rests on a false assumption, for it is not proved that the constitution of the Latin league absolutely prohibited a separate war between two Latin communities (I. III. The Latin League). Still less is the fact that a number of Alban families were received into the burgess-union of Rome inconsistent with the destruction of Alba by the Romans. Why may there not have been a Roman party in Alba just as there was in Capua? The circumstance, however, of Rome claiming to be in a religious and political point of view the heir-at-law of Alba may be regarded as decisive of the matter; for such a claim could not be based on the migration of individual clans to Rome, but could only be based, as it actually was, on the conquest of the town.

4. I. Vi. Amalgamation of the Palatine and Quirinal Cities

5. Hence was developed the conception, in political law, of the maritime colony or colony of burgesses (-colonia civium Romanorum-), that is, of a community separate in fact, but not independent or possessing a will of its own in law; a community which merged in the capital as the -peculium- of the son merged in the property of the father, and which as a standing garrison was exempt from serving in the legion.

6. To this the enactment of the Twelve Tables undoubtedly has reference: -Nex[i] mancipiique] forti sanatique idem ius esto-, that is, in dealings of private law the "sound" and the "recovered" shall be on a footing of equality. The Latin allies cannot be here referred to, because their legal position was defined by federal treaties, and the law of the Twelve Tables treated only of the law of Rome. The -sanates- were the -Latini prisci cives Romani-, or in other words, the communities of Latium compelled by the Romans to enter the plebeiate.

7. The community of Bovillae appears even to have been formed out of part of the Alban domain, and to have been admitted in room of Alba among the autonomous Latin towns. Its Alban origin is attested by its having been the seat of worship for the Julian gens and by the name -Albani Longani Bovillenses- (Orelli-Henzen, 119, 2252, 6019); its autonomy by Dionysius, v. 61, and Cicero, pro Plancio, 9, 23.

Page 102

8. I. III. The Latin League

9. I. III. The Latin League

10. Both names, although afterwards employed as local names (-capitolium- being applied to the summit of the stronghold-hill that lay next to the river, -arx- to that next to the Quirinal), were originally appellatives, corresponding exactly to the Greek —akra— and —koruphei— every Latin town had its -capitolium-as well as Rome. The local name of the Roman stronghold-hill was -mons Tarpeius-.

11. The enactment -ne quis patricius in arce aut capitolio habitaret-probably prohibited only the conversion of the ground into private property, not the construction of dwelling-houses. Comp. Becker, Top. p. 386.

12. For the chief thoroughfare, the -Via Sacra-, led from that quarter to the stronghold; and the bending in towards the gate may still be clearly recognized in the turn which this makes to the left at the arch of Severus. The gate itself must have disappeared under the huge structures which were raised in after ages on the Clivus. The so-called gate at the steepest part of the Capitoline Mount, which is known by the name of Janualis or Saturnia, or the “open,” and which had to stand always open in times of war, evidently had merely a religious significance, and never was a real gate.

13. Four such guilds are mentioned (1) the -Capitolini- (Cicero, ad Q. fr. ii. 5, 2), with -magistri- of their own (Henzen, 6010, 6011), and annual games (Liv. v. 50; comp. Corp. Inscr. Lat. i. n. 805); (2) the -Mercuriales- (Liv. ii. 27; Cicero, l. c.; Preller, Myth. p. 597) likewise with -magistri- (Henzen, 6010), the guild from the valley of the Circus, where the temple of Mercury stood; (3) the -pagani Aventinenses- likewise with -magistri- (Henzen, 6010); and (4) the -pagani pagi Ianiculensis- likewise with -magistri- (C. I. L. i. n. 801, 802). It is certainly not accidental that these four guilds, the only ones of the sort that occur in Rome, belong to the very two hills excluded from the four local tribes but enclosed by the Servian wall, the Capitol and the Aventine, and the Janiculum belonging to the same fortification; and connected with this is the further fact that the expression -montani paganive-is employed as a designation of the whole inhabitants in connection with the city (comp. besides the well-known passage, Cic. de Domo, 28, 74, especially the law as to the city aqueducts in Festus, v. sifus, p. 340; [-mon]tani paganive si[fis aquam dividunto-]). The -montani-, properly the inhabitants of the three regions of the Palatine town (iv. The Hill-Romans On the Quirinal), appear to be here put -a potiori- for the whole population of the four regions of the city proper. The -pagani- are, undoubtedly, the residents of the Aventine and Janiculum not included in the tribes, and the analogous -collegia- of the Capitol and the Circus valley.

Page 103

14. The “Seven-hill-city” in the proper and religious sense was and continued to be the narrower Old-Rome of the Palatine (iv. The Palatine City). Certainly the Servian Rome also regarded itself, at least as early as the time of Cicero (comp. e. g. Cic. ad Att. vi. 5, 2; Plutarch, Q. Rom. 69), as “Seven-hill-city,” probably because the festival of the Septimontium, which was celebrated with great zeal even under the Empire, began to be regarded as a festival for the city generally; but there was hardly any definite agreement reached as to which of the heights embraced by the Servian ring-wall belonged to the “seven.” The enumeration of the Seven Mounts familiar to us, viz. Palatine, Aventine, Caelian, Esquiline, Viminal, Quirinal, Capitoline, is not given by any ancient author. It is put together from the traditional narrative of the gradual rise of the city (Jordan, *Topographie*, ii. 206 seq.), and the Janiculum is passed over in it, simply because otherwise the number would come out as eight. The earliest authority that enumerates the Seven Mounts (-montes-) of Rome is the description of the city from the age of Constantine the Great. It names as such the Palatine, Aventine, Caelian, Esquiline, Tarpeian, Vatican, and Janiculum,—where the Quirinal and Viminal are, evidently as -colles-, omitted, and in their stead two “-montes-” are introduced from the right bank of the Tiber, including even the Vatican which lay outside of the Servian wall. Other still later lists are given by Servius (ad Aen. vi. 783), the Berne Scholia to Virgil’s *Georgics* (ii. 535), and Lydus (*de Mens.* p. 118, Bekker).

15. Both the situation of the two temples, and the express testimony of Dionysius, ii. 65, that the temple of Vesta lay outside of the Roma quadrata, prove that these structures were connected with the foundation not of the Palatine, but of the second (Servian) city. Posterity reckoned this -regia- with the temple of Vesta as a scheme of Numa; but the cause which gave rise to that hypothesis is too manifest to allow of our attaching any weight to it.

CHAPTER VIII

The Umbro-Sabellian Stocks—Beginnings of the Samnites

Umbro-Sabellian Migration

The migration of the Umbrian stocks appears to have begun at a period later than that of the Latins. Like the Latin, it moved in a southerly direction, but it kept more in the centre of the peninsula and towards the east coast. It is painful to speak of it; for our information regarding it comes to us like the sound of bells from a town that has been sunk in the sea. The Umbrian people extended according to Herodotus as far as the

Alps, and it is not improbable that in very ancient times they occupied the whole of Northern Italy, to the point where the

Page 104

settlements of the Illyrian stocks began on the east, and those of the Ligurians on the west. As to the latter, there are traditions of their conflicts with the Umbrians, and we may perhaps draw an inference regarding their extension in very early times towards the south from isolated names, such as that of the island of Ilva (Elba) compared with the Ligurian Ilvates. To this period of Umbrian greatness the evidently Italian names of the most ancient settlements in the valley of the Po, Atria (black-town), and Spina (thorn-town), probably owe their origin, as well as the numerous traces of Umbrians in southern Etruria (such as the river Umbro, Camars the old name of Clusium, Castrum Amerinum). Such indications of an Italian population having preceded the Etruscan especially occur in the most southern portion of Etruria, the district between the Ciminian Forest (below Viterbo) and the Tiber. In Falerii, the town of Etruria nearest to the frontier of Umbria and the Sabine country, according to the testimony of Strabo a language was spoken different from the Etruscan, and inscriptions bearing out that statement have recently been brought to light there, the alphabet and language of which, while presenting points of contact with the Etruscan, exhibit a general resemblance to the Latin.⁽¹⁾ The local worship also presents traces of a Sabellian character; and a similar inference is suggested by the primitive relations subsisting in sacred as well as other matters between Caere and Rome. It is probable that the Etruscans wrested those southern districts from the Umbrians at a period considerably subsequent to their occupation of the country on the north of the Ciminian Forest, and that an Umbrian population maintained itself there even after the Tuscan conquest. In this fact we may presumably find the ultimate explanation of the surprising rapidity with which the southern portion of Etruria became Latinized, as compared with the tenacious retention of the Etruscan language and manners in northern Etruria, after the Roman conquest. That the Umbrians were after obstinate struggles driven back from the north and west into the narrow mountainous country between the two arms of the Apennines which they subsequently held, is clearly indicated by the very fact of their geographical position, just as the position of the inhabitants of the Grisons and that of the Basques at the present day indicates the similar fate that has befallen them. Tradition also has to report that the Tuscans wrested from the Umbrians three hundred towns; and, what is of more importance as evidence, in the national prayers of the Umbrian Iguvini, which we still possess, along with other stocks the Tuscans especially are cursed as public foes.

Page 105

In consequence, as may be presumed, of this pressure exerted upon them from the north, the Umbrians advanced towards the south, keeping in general upon the heights, because they found the plains already occupied by Latin stocks, but beyond doubt frequently making inroads and encroachments on the territory of the kindred race, and intermingling with them the more readily, that the distinction in language and habits could not have been at all so marked then as we find it afterwards. To the class of such inroads belongs the tradition of the irruption of the Reatini and Sabines into Latium and their conflicts with the Romans; similar phenomena were probably repeated all along the west coast. Upon the whole the Sabines maintained their footing in the mountains, as in the district bordering on Latium which has since been called by their name, and so too in the Volscian land, presumably because the Latin population did not extend thither or was there less dense; while on the other hand the well-peopled plains were better able to offer resistance to the invaders, although they were not in all cases able or desirous to prevent isolated bands from gaining a footing, such as the Titii and afterwards the Claudii in Rome.⁽²⁾ In this way the stocks here became variously mingled, a state of things which serves to explain the numerous relations that subsisted between the Volscians and Latins, and how it happened that their district, as well as Sabina, afterwards became so early and speedily Latinized.

Samnites

The chief branch, however, of the Umbrian stock threw itself eastward from Sabina into the mountains of the Abruzzi, and the adjacent hill-country to the south of them. Here, as on the west coast, they occupied the mountainous districts, whose thinly scattered population gave way before the immigrants or submitted to their yoke; while in the plain along the Apulian coast the ancient native population, the Iapygians, upon the whole maintained their ground, although involved in constant feuds, especially on the northern frontier about Luceria and Arpi. When these migrations took place, cannot of course be determined; but it was presumably about the time when kings ruled in Rome. Tradition reports that the Sabines, pressed by the Umbrians, vowed a *-ver sacrum-*, that is, swore that they would give up and send beyond their bounds the sons and daughters born in the year of war, so soon as these should reach maturity, that the gods might at their pleasure destroy them or bestow upon them new abodes in other lands. One band was led by the ox of Mars; these were the *Safini* or Samnites, who in the first instance established themselves on the mountains adjoining the river *Sagrus*, and at a later period proceeded to occupy the beautiful plain on the east of the *Matese* chain, near the sources of the *Tifernus*. Both in their old and in their new territory they named their place of public assembly—which

Page 106

in the one case was situated near Agnone, in the other near Bojano—from the ox which led them Bovianum. A second band was led by the woodpecker of Mars; these were the Picentes, “the woodpecker-people,” who took possession of what is now the March of Ancona. A third band was led by the wolf (-hirpus-) into the region of Beneventum; these were the Hirpini. In a similar manner the other small tribes branched off from the common stock—the Praetuttii near Teramo; the Vestini on the Gran Sasso; the Marrucini near Chieti; the Frentani on the frontier of Apulia; the Paeligni on the Majella mountains; and lastly the Marsi on the Fucine lake, coming in contact with the Volscians and Latins. All of these tribes retained, as these legends clearly show, a vivid sense of their relationship and of their having come forth from the Sabine land. While the Umbrians succumbed in the unequal struggle and the western offshoots of the same stock became amalgamated with the Latin or Hellenic population, the Sabellian tribes prospered in the seclusion of their distant mountain land, equally remote from collision with the Etruscans, the Latins, and the Greeks. There was little or no development of an urban life amongst them; their geographical position almost wholly precluded them from engaging in commercial intercourse, and the mountain-tops and strongholds sufficed for the necessities of defence, while the husbandmen continued to dwell in open hamlets or wherever each found the well-spring and the forest or pasture that he desired. In such circumstances their constitution remained stationary; like the similarly situated Arcadians in Greece, their communities never became incorporated into a single state; at the utmost they only formed confederacies more or less loosely connected. In the Abruzzi especially, the strict seclusion of the mountain valleys seems to have debarred the several cantons from intercourse either with each other or with the outer world. They maintained but little connection with each other and continued to live in complete isolation from the rest of Italy; and in consequence, notwithstanding the bravery of their inhabitants, they exercised less influence than any other portion of the Italian nation on the development of the history of the peninsula.

Their Political Development

On the other hand the Samnite people decidedly exhibited the highest political development among the eastern Italian stock, as the Latin nation did among the western. From an early period, perhaps from its first immigration, a comparatively strong political bond held together the Samnite nation, and gave to it the strength which subsequently enabled it to contend with Rome on equal terms for the first place in Italy. We are as ignorant of the time and manner of the formation of the bond, as we are of its federal constitution; but it is clear that in Samnium no single community was preponderant, and still less was there any town to

Page 107

serve as a central rallying point and bond of union for the Samnite stock, such as Rome was for the Latins. The strength of the land lay in its -communes-of husbandmen, and authority was vested in the assembly formed of their representatives; it was this assembly which in case of need nominated a federal commander-in-chief. In consequence of its constitution the policy of this confederacy was not aggressive like the Roman, but was limited to the defence of its own bounds; only where the state forms a unity is power so concentrated and passion so strong, that the extension of territory can be systematically pursued. Accordingly the whole history of the two nations is prefigured in their diametrically opposite systems of colonization. Whatever the Romans gained, was a gain to the state: the conquests of the Samnites were achieved by bands of volunteers who went forth in search of plunder and, whether they prospered or were unfortunate, were left to their own resources by their native home. The conquests, however, which the Samnites made on the coasts of the Tyrrhenian and Ionic seas, belong to a later age; during the regal period in Rome they seem to have been only gaining possession of the settlements in which we afterwards find them. As a single incident in the series of movements among the neighbouring peoples caused by this Samnite settlement may be mentioned the surprise of Cumae by Tyrrhenians from the Upper Sea, Umbrians, and Daunians in the year 230. If we may give credit to the accounts of the matter which present certainly a considerable colouring of romance, it would appear that in this instance, as was often the case in such expeditions, the intruders and those whom they supplanted combined to form one army, the Etruscans joining with their Umbrian enemies, and these again joined by the Iapygians whom the Umbrian settlers had driven towards the south. Nevertheless the undertaking proved a failure: on this occasion at least the Hellenic superiority in the art of war, and the bravery of the tyrant Aristodemus, succeeded in repelling the barbarian assault on the beautiful seaport.

Notes for Book I Chapter VIII

1. In the alphabet the -"id:r" especially deserves notice, being of the Latin (-"id:R") and not of the Etruscan form (-"id:D"), and also the -"id:z" (—"id:Xl"); it can only be derived from the primitive Latin, and must very faithfully represent it. The language likewise has close affinity with the oldest Latin; -Marci Acarcelini he cupa-, that is, -Marcius Acarcelinius heic cubat-: -Menerva A. Cotena La. f...zenatuo sentem..dedet cuando..cuncaptum-, that is, -Minervae A(ulus?) Cotena La(rtis) f(ilius) de senatus sententia dedit quando (perhaps=olim) conceptum-. At the same time with these and similar inscriptions there have been found some others in a different character and language, undoubtedly Etruscan.

2. I. IV. Tities, Luceres

Page 108

CHAPTER IX

The Etruscans

Etruscan Nationality

The Etruscan people, or Ras,(1) as they called themselves, present a most striking contrast to the Latin and Sabellian Italians as well as to the Greeks. They were distinguished from these nations by their very bodily structure: instead of the slender and symmetrical proportions of the Greeks and Italians, the sculptures of the Etruscans exhibit only short sturdy figures with large head and thick arms. Their manners and customs also, so far as we are acquainted with them, point to a deep and original diversity from the Graeco-Italian stocks. The religion of the Tuscans in particular, presenting a gloomy fantastic character and delighting in the mystical handling of numbers and in wild and horrible speculations and practices, is equally remote from the clear rationalism of the Romans and the genial image-worship of the Hellenes. The conclusion which these facts suggest is confirmed by the most important and authoritative evidence of nationality, the evidence of language. The remains of the Etruscan tongue which have reached us, numerous as they are and presenting as they do various data to aid in deciphering it, occupy a position of isolation so complete, that not only has no one hitherto succeeded in interpreting these remains, but no one has been able even to determine precisely the place of Etruscan in the classification of languages. Two periods in the development of the language may be clearly distinguished. In the older period the vocalization of the language was completely carried out, and the collision of two consonants was almost without exception avoided. (2) By throwing off the vocal and consonantal terminations, and by the weakening or rejection of the vowels, this soft and melodious language was gradually changed in character, and became intolerably harsh and rugged.(3) They changed for example -ramu*af-into -ram*a-, Tarquinius into -Tarchnaf-, Minerva into -Menrva-, Menelaos, Polydeukes, Alexandros, into -Menle-, -Pultuke-, -Elchsentre-. The indistinct and rugged nature of their pronunciation is shown most clearly by the fact that at a very early period the Etruscans made no distinction of -o from -u, -b from -p, -c from -g, -d from -t. At the same time the accent was, as in Latin and in the more rugged Greek dialects, uniformly thrown back upon the initial syllable. The aspirate consonants were treated in a similar fashion; while the Italians rejected them with the exception of the aspirated -b or the -f, and the Greeks, reversing the case, rejected this sound and retained the others —theta, —phi, —chi, the Etruscans allowed the softest and most pleasing of them, the —phi, to drop entirely except in words borrowed from other languages, but made use of the other three to an extraordinary extent, even where they had no proper place; Thetis

Page 109

for example became -Thethis-, Telephus -Thelaphe-, Odysseus -Utuzē- or -Uthuze-. Of the few terminations and words, whose meaning has been ascertained, the greater part are far remote from all Graeco-Italian analogies; such as, all the numerals; the termination -al employed as a designation of descent, frequently of descent from the mother, e. g. -Cania-, which on a bilingual inscription of Chiusi is translated by -Cainnia natus-; and the termination -sa in the names of women, used to indicate the clan into which they have married, e. g. -Lecnesa-denoting the spouse of a -Licinius-. So -cela- or -clan- with the inflection -clensi- means son; -se(—chi)- daughter; -ril- year; the god Hermes becomes -Turms-, Aphrodite -Turan-, Hephaestos -Sethlans-, Bakchos -Fufluns-. Alongside of these strange forms and sounds there certainly occur isolated analogies between the Etruscan and the Italian languages. Proper names are formed, substantially, after the general Italian system. The frequent gentile termination -enas or -ena(4) recurs in the termination -enus which is likewise of frequent occurrence in Italian, especially in Sabellian clan-names; thus the Etruscan names -Maecenas- and -Spurinna- correspond closely to the Roman -Maecius-and -Spurius-. A number of names of divinities, which occur as Etruscan on Etruscan monuments or in authors, have in their roots, and to some extent even in their terminations, a form so thoroughly Latin, that, if these names were really originally Etruscan, the two languages must have been closely related; such as -Usil- (sun and dawn, connected with -ausum-, -aurum-, -aurora-, -sol-), -Minerva-(—menervare-) -Lasa-(—lascivus-), -Neptunus-, -Votumna-. As these analogies, however, may have had their origin only in the subsequent political and religious relations between the Etruscans and Latins, and in the accommodations and borrowings to which these relations gave rise, they do not invalidate the conclusion to which we are led by the other observed phenomena, that the Tuscan language differed at least as widely from all the Graeco-Italian dialects as did the language of the Celts or of the Slavonians. So at least it sounded to the Roman ear; “Tuscan and Gallic” were the languages of barbarians, “Oscan and Volscian” were but rustic dialects.

But, while the Etruscans differed thus widely from the Graeco-Italian family of languages, no one has yet succeeded in connecting them with any other known race. All sorts of dialects have been examined with a view to discover affinity with the Etruscan, sometimes by simple interrogation, sometimes by torture, but all without exception in vain. The geographical position of the Basque nation would naturally suggest it for comparison; but even in the Basque language no analogies of a decisive character have been brought forward. As little do the scanty remains of the Ligurian language which have reached our time, consisting of local and personal names, indicate any

Page 110

connection with the Tuscans. Even the extinct nation which has constructed those enigmatical sepulchral towers, called -Nuraghe-, by thousands in the islands of the Tuscan Sea, especially in Sardinia, cannot well be connected with the Etruscans, for not a single structure of the same character is to be met with in Etruscan territory. The utmost we can say is that several traces, that seem tolerably trustworthy, point to the conclusion that the Etruscans may be on the whole numbered with the Indo-Germans. Thus -mi- in the beginning of many of the older inscriptions is certainly —emi—, —eimi—, and the genitive form of consonantal stems veneruf -rafuvuf-is exactly reproduced in old Latin, corresponding to the old Sanscrit termination -as. In like manner the name of the Etruscan Zeus, -Tina-or -Tinia-, is probably connected with the Sanscrit -dina-, meaning day, as —Zan— is connected with the synonymous -diwan-. But, even granting this, the Etruscan people appears withal scarcely less isolated “The Etruscans,” Dionysius said long ago, “are like no other nation in language and manners;” and we have nothing to add to his statement.

Home of the Etruscans

It is equally difficult to determine from what quarter the Etruscans migrated into Italy; nor is much lost through our inability to answer the question, for this migration belonged at any rate to the infancy of the people, and their historical development began and ended in Italy. No question, however, has been handled with greater zeal than this, in accordance with the principle which induces antiquaries especially to inquire into what is neither capable of being known nor worth the knowing—to inquire “who was Hecuba’s mother,” as the emperor Tiberius professed to do. As the oldest and most important Etruscan towns lay far inland—in fact we find not a single Etruscan town of any note immediately on the coast except Populonia, which we know for certain was not one of the old twelve cities— and the movement of the Etruscans in historical times was from north to south, it seems probable that they migrated into the peninsula by land. Indeed the low stage of civilization, in which we find them at first, would ill accord with the hypothesis of immigration by sea. Nations even in the earliest times crossed a strait as they would a stream; but to land on the west coast of Italy was a very different matter. We must therefore seek for the earlier home of the Etruscans to the west or north of Italy. It is not wholly improbable that the Etruscans may have come into Italy over the Raetian Alps; for the oldest traceable settlers in the Grisons and Tyrol, the Raeti, spoke Etruscan down to historical times, and their name sounds similar to that of the Ras. These may no doubt have been a remnant of the Etruscan settlements on the Po; but it is at least quite as likely that they may have been a portion of the people which remained behind in its earlier abode.

Page 111

Story of Their Lydian Origin

In glaring contradiction to this simple and natural view stands the story that the Etruscans were Lydians who had emigrated from Asia. It is very ancient: it occurs even in Herodotus; and it reappears in later writers with innumerable changes and additions, although several intelligent inquirers, such as Dionysius, emphatically declared their disbelief in it, and pointed to the fact that there was not the slightest apparent similarity between the Lydians and Etruscans in religion, laws, manners, or language. It is possible that an isolated band of pirates from Asia Minor may have reached Etruria, and that their adventure may have given rise to such tales; but more probably the whole story rests on a mere verbal mistake. The Italian Etruscans or the -Turs-ennae- (for this appears to be the original form and the basis of the Greek —Turs-einnoi—, —Turreinnoi—, of the Umbrian -Turs-ci-, and of the two Roman forms -Tusci-, -Etrusci-) nearly coincide in name with the Lydian people of the —Torreiboι— or perhaps also —Turr-einoi—, so named from the town —Turra—. This manifestly accidental resemblance in name seems to be in reality the only foundation for that hypothesis—not rendered more trustworthy by its great antiquity—and for all the pile of crude historical speculations that has been reared upon it. By connecting the ancient maritime commerce of the Etruscans with the piracy of the Lydians, and then by confounding (Thucydides is the first who has demonstrably done so) the Torrhebian pirates, whether rightly or wrongly, with the bucaneeering Pelasgians who roamed and plundered on every sea, there has been produced one of the most mischievous complications of historical tradition. The term Tyrrhenians denotes sometimes the Lydian Torrhebi—as is the case in the earliest sources, such as the Homeric hymns; sometimes under the form Tyrrheno-Pelasgians or simply that of Tyrrhenians, the Pelasgian nation; sometimes, in fine, the Italian Etruscans, although the latter never came into lasting contact with the Pelasgians or Torrhebians, or were at all connected with them by common descent.

Settlements of the Etruscans in Italy

It is, on the other hand, a matter of historical interest to determine what were the oldest traceable abodes of the Etruscans, and what were their further movements when they issued thence. Various circumstances attest that before the great Celtic invasion they dwelt in the district to the north of the Po, being conterminous on the east along the Adige with the Veneti of Illyrian (Albanian?) descent, on the west with the Ligurians. This is proved in particular by the already-mentioned rugged Etruscan dialect, which was still spoken in the time of Livy by the inhabitants of the Raetian Alps, and by the fact that Mantua remained Tuscan down to a late period. To the south of

Page 112

the Po and at the mouths of that river Etruscans and Umbrians were mingled, the former as the dominant, the latter as the older race, which had founded the old commercial towns of Atria and Spina, while the Tuscans appear to have been the founders of Felsina (Bologna) and Ravenna. A long time elapsed ere the Celts crossed the Po; hence the Etruscans and Umbrians left deeper traces of their existence on the right bank of the river than they had done on the left, which they had to abandon at an early period. All the regions, however, to the north of the Apennines passed too rapidly out of the hands of one nation into those of another to permit the formation of any continuous national development there.

Etruria

Far more important in an historical point of view was the great settlement of the Tuscans in the land which still bears their name. Although Ligurians or Umbrians were probably at one time⁽⁵⁾ settled there, the traces of them have been almost wholly effaced by the Etruscan occupation and civilization. In this region, which extends along the coast from Pisae to Tarquinii and is shut in on the east by the Apennines, the Etruscan nationality found its permanent abode and maintained itself with great tenacity down to the time of the empire. The northern boundary of the proper Tuscan territory was formed by the Arnus; the region north from the Arnus as far as the mouth of the Macra and the Apennines was a debateable border land in the possession sometimes of Ligurians, sometimes of Etruscans, and for this reason larger settlements were not successful there. The southern boundary was probably formed at first by the Ciminian Forest, a chain of hills south of Viterbo, and at a later period by the Tiber. We have already⁽⁶⁾ noticed the fact that the territory between the Ciminian range and the Tiber with the towns of Sutrium, Nepete, Falerii, Veii, and Caere appears not to have been taken possession of by the Etruscans till a period considerably later than the more northern districts, possibly not earlier than in the second century of Rome, and that the original Italian population must have maintained its ground in this region, especially in Falerii, although in a relation of dependence.

Relations of the Etruscans to Latium

From the time at which the river Tiber became the line of demarcation between Etruria on the one side and Umbria and Latium on the other, peaceful relations probably upon the whole prevailed in that quarter, and no essential change seems to have taken place in the boundary line, at least so far as concerned the Latin frontier. Vividly as the Romans were impressed by the feeling that the Etruscan was a foreigner, while the Latin was their countryman, they yet seem to have stood in much less fear of attack or

of danger from the right bank of the river than, for example, from their kinsmen in Gabii and Alba; and this was

Page 113

natural, for they were protected in that direction not merely by the broad stream which formed a natural boundary, but also by the circumstance, so momentous in its bearing on the mercantile and political development of Rome, that none of the more powerful Etruscan towns lay immediately on the river, as did Rome on the Latin bank. The Veientes were the nearest to the Tiber, and it was with them that Rome and Latium came most frequently into serious conflict, especially for the possession of Fidenae, which served the Veientes as a sort of -tete de pont- on the left bank just as the Janiculum served the Romans on the right, and which was sometimes in the hands of the Latins, sometimes in those of the Etruscans. The relations of Rome with the somewhat more distant Caere were on the whole far more peaceful and friendly than those which we usually find subsisting between neighbours in early times. There are doubtless vague legends, reaching back to times of distant antiquity, about conflicts between Latium and Caere; Mezentius the king of Caere, for instance, is asserted to have obtained great victories over the Latins, and to have imposed upon them a wine-tax; but evidence much more definite than that which attests a former state of feud is supplied by tradition as to an especially close connection between the two ancient centres of commercial and maritime intercourse in Latium and Etruria. Sure traces of any advance of the Etruscans beyond the Tiber, by land, are altogether wanting. It is true that Etruscans are named in the first ranks of the great barbarian host, which Aristodemus annihilated in 230 under the walls of Cumae;(7) but, even if we regard this account as deserving credit in all its details, it only shows that the Etruscans had taken part in a great plundering expedition. It is far more important to observe that south of the Tiber no Etruscan settlement can be pointed out as having owed its origin to founders who came by land; and that no indication whatever is discernible of any serious pressure by the Etruscans upon the Latin nation. The possession of the Janiculum and of both banks of the mouth of the Tiber remained, so far as we can see, undisputed in the hands of the Romans. As to the migrations of bodies of Etruscans to Rome, we find an isolated statement drawn from Tuscan annals, that a Tuscan band, led by Caelius Vivenna of Volsinii and after his death by his faithful companion Mastarna, was conducted by the latter to Rome. This may be trustworthy, although the derivation of the name of the Caelian Mount from this Caelius is evidently a philological invention, and even the addition that this Mastarna became king in Rome under the name of Servius Tullius is certainly nothing but an improbable conjecture of the archaeologists who busied themselves with legendary parallels. The name of the "Tuscan quarter" at the foot of the Palatine(8) points further to Etruscan settlements in Rome.

The Tarquins

Page 114

It can hardly, moreover, be doubted that the last regal family which ruled over Rome, that of the Tarquins, was of Etruscan origin, whether it belonged to Tarquinii, as the legend asserts, or to Caere, where the family tomb of the Tarchnas has recently been discovered. The female name Tanaquil or Tanchvil interwoven with the legend, while it is not Latin, is common in Etruria. But the traditional story—according to which Tarquin was the son of a Greek who had migrated from Corinth to Tarquinii, and came to settle in Rome as a —*metoikos*— is neither history nor legend, and the historical chain of events is manifestly in this instance not confused merely, but completely torn asunder. If anything more can be deduced from this tradition beyond the bare and at bottom indifferent fact that at last a family of Tuscan descent swayed the regal sceptre in Rome, it can only be held as implying that this dominion of a man of Tuscan origin ought not to be viewed either as a dominion of the Tuscans or of any one Tuscan community over Rome, or conversely as the dominion of Rome over southern Etruria. There is, in fact, no sufficient ground either for the one hypothesis or for the other. The history of the Tarquins had its arena in Latium, not in Etruria; and Etruria, so far as we can see, during the whole regal period exercised no influence of any essential moment on either the language or customs of Rome, and did not at all interrupt the regular development of the Roman state or of the Latin league.

The cause of this comparatively passive attitude of Etruria towards the neighbouring land of Latium is probably to be sought partly in the struggles of the Etruscans with the Celts on the Po, which presumably the Celts did not cross until after the expulsion of the kings from Rome, and partly in the tendency of the Etruscan people towards seafaring and the acquisition of supremacy on the sea and seaboard—a tendency decidedly exhibited in their settlements in Campania, and of which we shall speak more fully in the next chapter.

The Etruscan Constitution

The Tuscan constitution, like the Greek and Latin, was based on the gradual transition of the community to an urban life. The early direction of the national energies towards navigation, trade, and manufactures appears to have called into existence urban commonwealths, in the strict sense of the term, earlier in Etruria than elsewhere in Italy. Caere is the first of all the Italian towns that is mentioned in Greek records. On the other hand we find that the Etruscans had on the whole less of the ability and the disposition for war than the Romans and Sabellians: the un-Italian custom of employing mercenaries for fighting occurs among the Etruscans at a very early period. The oldest constitution of the communities must in its general outlines have resembled that of Rome. Kings or *Lucumones* ruled, possessing similar

Page 115

insignia and probably therefore a similar plenitude of power with the Roman kings. A strict line of demarcation separated the nobles from the common people. The resemblance in the clan-organization is attested by the analogy of the system of names; only, among the Etruscans, descent on the mother's side received much more consideration than in Roman law. The constitution of their league appears to have been very lax. It did not embrace the whole nation; the northern and the Campanian Etruscans were associated in confederacies of their own, just in the same way as the communities of Etruria proper. Each of these leagues consisted of twelve communities, which recognized a metropolis, especially for purposes of worship, and a federal head or rather a high priest, but appear to have been substantially equal in respect of rights; while some of them at least were so powerful that neither could a hegemony establish itself, nor could the central authority attain consolidation. In Etruria proper Volsinii was the metropolis; of the rest of its twelve towns we know by trustworthy tradition only Perusia, Vetulonium, Volci, and Tarquinii. It was, however, quite as unusual for the Etruscans really to act in concert, as it was for the Latin confederacy to do otherwise. Wars were ordinarily carried on by a single community, which endeavoured to interest in its cause such of its neighbours as it could; and when an exceptional case occurred in which war was resolved on by the league, individual towns very frequently kept aloof from it. The Etruscan confederations appear to have been from the first—still more than the other Italian leagues formed on a similar basis of national affinity—deficient in a firm and paramount central authority.

Notes for Book I Chapter IX

1. -Ras-ennac-, with the gentile termination mentioned below.

2. To this period belong e. g. inscriptions on the clay vases of

umaramlisia(—“id:theta”)ipurenaie(—“id:theta”)eeraisieepanamine (—“id:theta”)unastavhelefu- or -mi ramu(—“id:theta”)af kaiufinaia-.

3. We may form some idea of the sound which the language now had from the commencement of the great inscription of Perusia; -eulat tanna laresul ameva(—“id:chi”)r lautn vel(—“id:theta”)inase stlaafunas slele(—“id:theta”)caru-.

4. Such as Maecenas, Porsena, Vivenna, Caecina, Spurinna. The vowel in the penult is originally long, but in consequence of the throwing back of the accent upon the initial syllable is frequently shortened and even rejected. Thus we find Porse(n)na as well as Porsena, and Ceicne as well as Caecina.

5. I. VIII. Umbro-Sabellian Migration
6. I. VIII. Their Political Development
7. I. VIII. Their Political Development
8. I. IV. Oldest Settlements in the Palatine and Suburan Regions

CHAPTER X

Page 116

The Hellenes in Italy—Maritime Supremacy of the Tuscans and Carthaginians

Relations of Italy with Other Lands

In the history of the nations of antiquity a gradual dawn ushered in the day; and in their case too the dawn was in the east. While the Italian peninsula still lay enveloped in the dim twilight of morning, the regions of the eastern basin of the Mediterranean had already emerged into the full light of a varied and richly developed civilization. It falls to the lot of most nations in the early stages of their development to be taught and trained by some rival sister-nation; and such was destined to be in an eminent degree the lot of the peoples of Italy. The circumstances of its geographical position, however, prevented this influence from being brought to bear upon the peninsula by land. No trace is to be found of any resort in early times to the difficult route by land between Italy and Greece. There were in all probability from time immemorial tracks for purposes of traffic, leading from Italy to the lands beyond the Alps; the oldest route of the amber trade from the Baltic joined the Mediterranean at the mouth of the Po—on which account the delta of the Po appears in Greek legend as the home of amber—and this route was joined by another leading across the peninsula over the Apennines to Pisae; but from these regions no elements of civilization could come to the Italians. It was the seafaring nations of the east that brought to Italy whatever foreign culture reached it in early times.

Phoenicians in Italy

The oldest civilized nation on the shores of the Mediterranean, the Egyptians, were not a seafaring people, and therefore exercised no influence on Italy. But the same may be with almost equal truth affirmed of the Phoenicians. It is true that, issuing from their narrow home on the extreme eastern verge of the Mediterranean, they were the first of all known races to venture forth in floating houses on the bosom of the deep, at first for the purpose of fishing and dredging, but soon also for the prosecution of trade. They were the first to open up maritime commerce; and at an incredibly early period they traversed the Mediterranean even to its furthest extremity in the west. Maritime stations of the Phoenicians appear on almost all its coasts earlier than those of the Hellenes: in Hellas itself, in Crete and Cyprus, in Egypt, Libya, and Spain, and likewise on the western Italian main. Thucydides tells us that all around Sicily, before the Greeks came thither or at least before they had established themselves there in any considerable numbers, the Phoenicians had set up their factories on the headlands and islets, not with a view to gain territory, but for the sake of trading with the natives. But it was otherwise in the case of continental Italy. No sure proof has hitherto been given of the existence

Page 117

of any Phoenician settlement there excepting one, a Punic factory at Caere, the memory of which has been preserved partly by the appellation -Punicum- given to a little village on the Caerite coast, partly by the other name of the town of Caere itself, -Agylla-, which is not, as idle fiction asserts, of Pelasgic origin, but is a Phoenician word signifying the "round town"—precisely the appearance which Caere presents when seen from the sea. That this station and any similar establishments which may have elsewhere existed on the coasts of Italy were neither of much importance nor of long standing, is evident from their having disappeared almost without leaving a trace. We have not the smallest reason to think them older than the Hellenic settlements of a similar kind on the same coasts. An evidence of no slight weight that Latium at least first became acquainted with the men of Canaan through the medium of the Hellenes is furnished by the Latin appellation "Poeni," which is borrowed from the Greek. All the oldest relations, indeed, of the Italians to the civilization of the east point decidedly towards Greece; and the rise of the Phoenician factory at Caere may be very well explained, without resorting to the pre-Hellenic period, by the subsequent well-known relations between the commercial state of Caere and Carthage. In fact, when we recall the circumstance that the earliest navigation was and continued to be essentially of a coasting character, it is plain that scarcely any country on the Mediterranean lay so remote from the Phoenicians as the Italian mainland. They could only reach it either from the west coast of Greece or from Sicily; and it may well be believed that the seamanship of the Hellenes became developed early enough to anticipate the Phoenicians in braving the dangers of the Adriatic and of the Tyrrhene seas. There is no ground therefore for the assumption that any direct influence was originally exercised by the Phoenicians over the Italians. To the subsequent relations between the Phoenicians holding the supremacy of the western Mediterranean and the Italians inhabiting the shores of the Tyrrhene sea our narrative will return in the sequel.

Greeks in Italy—Home of the Greek Immigrants

To all appearance, therefore, the Hellenic mariners were the first among the inhabitants of the eastern basin of the Mediterranean to navigate the coasts of Italy. Of the important questions however as to the region from which, and as to the period at which, the Greek seafarers came thither, only the former admits of being answered with some degree of precision and fulness. The Aeolian and Ionian coast of Asia Minor was the region where Hellenic maritime traffic first became developed on a large scale, and whence issued the Greeks who explored the interior of the Black Sea on the one hand and the coasts of Italy on the other. The name of the Ionian Sea, which was retained by the waters intervening between

Page 118

Epirus and Sicily, and that of the Ionian gulf, the term by which the Greeks in earlier times designated the Adriatic Sea, are memorials of the fact that the southern and eastern coasts of Italy were once discovered by seafarers from Ionia. The oldest Greek settlement in Italy, Kyme, was, as its name and legend tell, founded by the town of the same name on the Anatolian coast. According to trustworthy Hellenic tradition, the Phocaeans of Asia Minor were the first of the Hellenes to traverse the more remote western sea. Other Greeks soon followed in the paths which those of Asia Minor had opened up; Ionians from Naxos and from Chalcis in Euboea, Achaeans, Locrians, Rhodians, Corinthians, Megarians, Messenians, Spartans. After the discovery of America the civilized nations of Europe vied with one another in sending out expeditions and forming settlements there; and the new settlers when located amidst barbarians recognized their common character and common interests as civilized Europeans more strongly than they had done in their former home. So it was with the new discovery of the Greeks. The privilege of navigating the western waters and settling on the western land was not the exclusive property of a single Greek province or of a single Greek stock, but a common good for the whole Hellenic nation; and, just as in the formation of the new North American world, English and French, Dutch and German settlements became mingled and blended, Greek Sicily and "Great Greece" became peopled by a mixture of all sorts of Hellenic races often so amalgamated as to be no longer distinguishable. Leaving out of account some settlements occupying a more isolated position—such as that of the Locrians with its offsets Hipponium and Medama, and the settlement of the Phocaeans which was not founded till towards the close of this period, Hyele (Velia, Elea)—we may distinguish in a general view three leading groups. The original Ionian group, comprehended under the name of the Chalcidian towns, included in Italy Cumae with the other Greek settlements at Vesuvius and Rhegium, and in Sicily Zankle (afterwards Messina), Naxos, Catana, Leontini, and Himera. The Achaean group embraced Sybaris and the greater part of the cities of Magna Graecia. The Dorian group comprehended Syracuse, Gela, Agrigentum, and the majority of the Sicilian colonies, while in Italy nothing belonged to it but Taras (Tarentum) and its offset Heraclea. On the whole the preponderance lay with the immigrants who belonged to the more ancient Hellenic influx, that of the Ionians and the stocks settled in the Peloponnesus before the Doric immigration. Among the Dorians only the communities with a mixed population, such as Corinth and Megara, took a special part, whereas the purely Doric provinces had but a subordinate share in the movement. This result was naturally to be expected, for the Ionians were from ancient times a trading and seafaring people, while it was only at a comparatively late period that the Dorian stocks

Page 119

descended from their inland mountains to the seaboard, and they always kept aloof from maritime commerce. The different groups of immigrants are very clearly distinguishable, especially by their monetary standards. The Phocaeans settlers coined according to the Babylonian standard which prevailed in Asia. The Chalcidian towns followed in the earliest times the Aeginetan, in other words, that which originally prevailed throughout all European Greece, and more especially the modification of it which is found occurring in Euboea. The Achaean communities coined by the Corinthian standard; and lastly the Doric colonies followed that which Solon introduced in Attica in the year of Rome 160, with the exception of Tarentum and Heraclea, which in their principal pieces adopted rather the standard of their Achaean neighbours than that of the Dorians in Sicily.

Time of the Greek Immigration

The dates of the earlier voyages and settlements will probably always remain enveloped in darkness. We may still, however, distinctly recognize a certain order of sequence. In the oldest Greek document, which belongs, like the earliest intercourse with the west, to the Ionians of Asia Minor—the Homeric poems—the horizon scarcely extends beyond the eastern basin of the Mediterranean. Sailors driven by storms into the western sea might have brought to Asia Minor accounts of the existence of a western land and possibly also of its whirlpools and island-mountains vomiting fire: but in the age of the Homeric poetry there was an utter want of trustworthy information respecting Sicily and Italy, even in that Greek land which was the earliest to enter into intercourse with the west; and the story-tellers and poets of the east could without fear of contradiction fill the vacant realms of the west, as those of the west in their turn filled the fabulous east, with their castles in the air. In the poems of Hesiod the outlines of Italy and Sicily appear better defined; there is some acquaintance with the native names of tribes, mountains, and cities in both countries; but Italy is still regarded as a group of islands. On the other hand, in all the literature subsequent to Hesiod, Sicily and even the whole coast of Italy appear as known, at least in a general sense, to the Hellenes. The order of succession of the Greek settlements may in like manner be ascertained with some degree of precision. Thucydides evidently regarded Cumae as the earliest settlement of note in the west; and certainly he was not mistaken. It is true that many a landing-place lay nearer at hand for the Greek mariner, but none were so well protected from storms and from barbarians as the island of Ischia, upon which the town was originally situated; and that such were the prevailing considerations that led to this settlement, is evident from the very position which was subsequently selected for it on the mainland—the steep but well-protected cliff, which still bears

Page 120

to the present day the venerable name of the Anatolian mother-city. Nowhere in Italy, accordingly, were the scenes of the legends of Asia Minor so vividly and tenaciously localized as in the district of Cumae, where the earliest voyagers to the west, full of those legends of western wonders, first stepped upon the fabled land and left the traces of that world of story, which they believed that they were treading, in the rocks of the Sirens and the lake of Avernus leading to the lower world. On the supposition, moreover, that it was in Cumae that the Greeks first became the neighbours of the Italians, it is easy to explain why the name of that Italian stock which was settled immediately around Cumae, the name of Opicans, came to be employed by them for centuries afterwards to designate the Italians collectively. There is a further credible tradition, that a considerable interval elapsed between the settlement at Cumae and the main Hellenic immigration into Lower Italy and Sicily, and that in this immigration Ionians from Chalcis and from Naxos took the lead. Naxos in Sicily is said to have been the oldest of all the Greek towns founded by strict colonization in Italy or Sicily; the Achaean and Dorian colonizations followed, but not until a later period.

It appears, however, to be quite impossible to fix the dates of this series of events with even approximate accuracy. The founding of the Achaean city of Sybaris in 33, and that of the Dorian city Tarentum in 46, are probably the most ancient dates in Italian history, the correctness, or at least approximation to correctness, of which may be looked upon as established. But how far beyond that epoch the sending forth of the earlier Ionian colonies reached back, is quite as uncertain as is the age which gave birth to the poems of Hesiod or even of Homer. If Herodotus is correct in the period which he assigns to Homer, the Greeks were still unacquainted with Italy a century before the foundation of Rome. The date thus assigned however, like all other statements respecting the Homeric age, is matter not of testimony, but of inference; and any one who carefully weighs the history of the Italian alphabets as well as the remarkable fact that the Italians had become acquainted with the Greek people before the name "Hellenes" had emerged for the race, and the Italians borrowed their designation for the Hellenes from the stock of the -Grai- or -Graeci- that early fell into abeyance in Hellas,(1) will be inclined to carry back the earliest intercourse of the Italians with the Greeks to an age considerably more remote.

Character of the Greek Immigration

The history of the Italian and Sicilian Greeks forms no part of the history of Italy; the Hellenic colonists of the west always retained the closest connection with their original home and participated in the national festivals and privileges of Hellenes. But it is of importance even as bearing on Italy, that we should indicate the diversities of character that prevailed in the Greek settlements there, and at least exhibit some of the leading

features which enabled the Greek colonization to exercise so varied an influence on Italy.

Page 121

The League of the Achaean Cities

Of all the Greek settlements, that which retained most thoroughly its distinctive character and was least affected by influences from without was the settlement which gave birth to the league of the Achaean cities, composed of the towns of Siris, Pandosia, Metabus or Metapontum, Sybaris with its offsets Posidonia and Laus, Croton, Caulonia, Temesa, Terina, and Pyxus. These colonists, taken as a whole, belonged to a Greek stock which steadfastly adhered to its own peculiar dialect, having closest affinity with the Doric, and for long retained no less steadfastly the old national Hellenic mode of writing, instead of adopting the more recent alphabet which had elsewhere come into general use; and which preserved its own nationality, as distinguished alike from the barbarians and from other Greeks, by the firm bond of a federal constitution. The language of Polybius regarding the Achaean symmarchy in the Peloponnesus may be applied also to these Italian Achaeans; "Not only did they live in federal and friendly communion, but they made use of like laws, like weights, measures, and coins, as well as of the same magistrates, councillors, and judges."

This league of the Achaean cities was strictly a colonization. The cities had no harbours—Croton alone had a paltry roadstead—and they had no commerce of their own; the Sybarite prided himself on growing gray between the bridges of his lagoon-city, and Milesians and Etruscans bought and sold for him. These Achaean Greeks, however, were not merely in possession of a narrow belt along the coast, but ruled from sea to sea in the "land of wine" and "of oxen" (—Oinotria—, —Italia—) or the "great Hellas;" the native agricultural population was compelled to farm their lands and to pay to them tribute in the character of clients or even of serfs. Sybaris—in its time the largest city in Italy—exercised dominion over four barbarian tribes and five-and-twenty townships, and was able to found Laus and Posidonia on the other sea. The exceedingly fertile low grounds of the Crathis and Bradanus yielded a superabundant produce to the Sybarites and Metapontines—it was there perhaps that grain was first cultivated for exportation. The height of prosperity which these states in an incredibly short time attained is strikingly attested by the only surviving works of art of these Italian Achaeans, their coins of chaste antequely beautiful workmanship—the earliest monuments of art and writing in Italy which we possess, as it can be shown that they had already begun to be coined in 174. These coins show that the Achaeans of the west did not simply participate in the noble development of plastic art that was at this very time taking place in the motherland, but were even superior in technical skill. For, while the silver pieces which were in use about that time in Greece proper and among the Dorians in Italy were thick, often stamped only on

Page 122

one side, and in general without inscription, the Italian Achaeans with great and independent skill struck from two similar dies partly cut in relief, partly sunk, large thin silver coins always furnished with inscriptions, and displaying the advanced organization of a civilized state in the mode of impression, by which they were carefully protected from the process of counterfeiting usual in that age—the plating of inferior metal with thin silver-foil.

Nevertheless this rapid bloom bore no fruit. Even Greeks speedily lost all elasticity of body and of mind in a life of indolence, in which their energies were never tried either by vigorous resistance on the part of the natives or by hard labour of their own. None of the brilliant names in Greek art or literature shed glory on the Italian Achaeans, while Sicily could claim ever so many of them, and even in Italy the Chalcidian Rhegium could produce its Ibycus and the Doric Tarentum its Archytas. With this people, among whom the spit was for ever turning on the hearth, nothing flourished from the outset but boxing. The rigid aristocracy which early gained the helm in the several communities, and which found in case of need a sure reserve of support in the federal power, prevented the rise of tyrants; but the danger to be apprehended was that the government of the best might be converted into a government of the few, especially if the privileged families in the different communities should combine to assist each other in carrying out their designs. Such was the predominant aim in the combination of mutually pledged “friends” which bore the name of Pythagoras. It enjoined the principle that the ruling class should be “honoured like gods,” and that the subject class should be “held in subservience like beasts,” and by such theory and practice provoked a formidable reaction, which terminated in the annihilation of the Pythagorean “friends” and the renewal of the ancient federal constitution. But frantic party feuds, insurrections en masse of the slaves, social abuses of all sorts, attempts to supply in practice an impracticable state-philosophy, in short, all the evils of demoralized civilization never ceased to rage in the Achaean communities, till under the accumulated pressure their political power utterly broke down.

It is no matter of wonder therefore that the Achaeans settled in Italy exercised less influence on its civilization than the other Greek settlements. An agricultural people, they had less occasion than those engaged in commerce to extend their influence beyond their political bounds. Within their own dominions they enslaved the native population and crushed the germs of their national development as Italians, while they refused to open up to them by means of complete Hellenization a new career. In this way the Greek characteristics, which were able elsewhere to retain a vigorous vitality notwithstanding all political misfortunes, disappeared more rapidly, more completely, and more ingloriously in Sybaris and Metapontum, in Croton and Posidonia, than in any other region; and the bilingual mongrel peoples, that arose in subsequent times out of the remains of the native Italians and Achaeans and the more recent immigrants of

Sabellian descent, never attained any real prosperity. This catastrophe, however, belongs in point of time to the succeeding period.

Page 123

Iono-Dorian Towns

The settlements of the other Greeks were of a different character, and exercised a very different effect upon Italy. They by no means despised agriculture and the acquisition of territory; it was not the wont of the Hellenes, at least when they had reached their full vigour, to rest content after the manner of the Phoenicians with a fortified factory in the midst of a barbarian land. But all their cities were founded primarily and especially for the sake of trade, and accordingly, altogether differing from those of the Achaeans, they were uniformly established beside the best harbours and lading-places. These cities were very various in their origin and in the occasion and period of their respective foundations; but there subsisted between them a certain fellowship, as in the common use by all of these towns of certain modern forms of the alphabet,(2) and in the very Dorism of their language, which made its way at an early date even into those towns that, like Cumae for example,(3) originally spoke the soft Ionic dialect. These settlements were of very various degrees of importance in their bearing on the development of Italy: it is sufficient at present to mention those which exercised a decided influence over the destinies of the Italian races, the Doric Tarentum and the Ionic Cumae.

Tarentum

Of all the Hellenic settlements in Italy, Tarentum was destined to play the most brilliant part. The excellent harbour, the only good one on the whole southern coast, rendered the city the natural emporium for the traffic of the south of Italy, and for some portion even of the commerce of the Adriatic. The rich fisheries of its gulf, the production and manufacture of its excellent wool, and the dyeing of it with the purple juice of the Tarentine -murex-, which rivalled that of Tyre—both branches of industry introduced there from Miletus in Asia Minor—employed thousands of hands, and added to the carrying trade a traffic of export. The coins struck at Tarentum in greater quantity than anywhere else in Grecian Italy, and struck pretty numerous even in gold, furnish to us a significant attestation of the lively and widely extended commerce of the Tarentines. At this epoch, when Tarentum was still contending with Sybaris for the first place among the Greek cities of Lower Italy, its extensive commercial connections must have been already forming; but the Tarentines seem never to have steadily and successfully directed their efforts to a substantial extension of their territory after the manner of the Achaean cities.

Greek Cities Near Vesuvius

Page 124

While the most easterly of the Greek settlements in Italy thus rapidly rose into splendour, those which lay furthest to the north, in the neighbourhood of Vesuvius, attained a more moderate prosperity. There the Cumaeans had crossed from the fertile island of Aenaria (Ischia) to the mainland, and had built a second home on a hill close by the sea, from whence they founded the seaport of Dicaearchia (afterwards Puteoli) and, moreover, the “new city” Neapolis. They lived, like the Chalcidian cities generally in Italy and Sicily, in conformity with the laws which Charondas of Catana (about 100) had established, under a constitution democratic but modified by a high census, which placed the power in the hands of a council of members selected from the wealthiest men—a constitution which proved lasting and kept these cities free, upon the whole, from the tyranny alike of usurpers and of the mob. We know little as to the external relations of these Campanian Greeks. They remained, whether from necessity or from choice, confined to a district of even narrower limits than the Tarentines; and issuing from it not for purposes of conquest and oppression, but for the holding of peaceful commercial intercourse with the natives, they created the means of a prosperous existence for themselves, and at the same time took the foremost place among the missionaries of Greek civilization in Italy.

Relations of the Adriatic Regions to the Greeks

While on the one side of the straits of Rhegium the whole southern coast of the mainland and its western coast as far as Vesuvius, and on the other the larger eastern half of the island of Sicily, were Greek territory, the west coast of Italy northward of Vesuvius and the whole of the east coast were in a position essentially different. No Greek settlements arose on the Italian seaboard of the Adriatic; and with this we may evidently connect the comparatively small number and subordinate importance of the Greek colonies planted on the opposite Illyrian shore and on the numerous adjacent islands. Two considerable mercantile towns, Epidamnus or Dyrrachium (now Durazzo, 127), and Apollonia (near Avlona, about 167), were founded upon the portion of this coast nearest to Greece during the regal period of Rome; but no old Greek colony can be pointed out further to the north, with the exception perhaps of the insignificant settlement at Black Corcyra (Curzola, about 174?). No adequate explanation has yet been given why the Greek colonization developed itself in this direction to so meagre an extent. Nature herself appeared to direct the Hellenes thither, and in fact from the earliest times there existed a regular traffic to that region from Corinth and still more from the settlement at Corcyra (Corfu) founded not long after Rome (about 44); a traffic, which had as its emporia on the Italian coast the towns of Spina and Atria, situated at the mouth of

Page 125

the Po. The storms of the Adriatic, the inhospitable character at least of the Illyrian coasts, and the barbarism of the natives are manifestly not in themselves sufficient to explain this fact. But it was a circumstance fraught with the most momentous consequences for Italy, that the elements of civilization which came from the east did not exert their influence on its eastern provinces directly, but reached them only through the medium of those that lay to the west. The Adriatic commerce carried on by Corinth and Corcyra was shared by the most easterly mercantile city of Magna Graecia, the Doric Tarentum, which by the possession of Hydrus (Otranto) had the command, on the Italian side, of the entrance of the Adriatic. Since, with the exception of the ports at the mouth of the Po, there were in those times no emporia worthy of mention along the whole east coast—the rise of Ancona belongs to a far later period, and later still the rise of Brundisium—it may well be conceived that the mariners of Epidamnus and Apollonia frequently discharged their cargoes at Tarentum. The Tarentines had also much intercourse with Apulia by land; all the Greek civilization to be met with in the south-east of Italy owed its existence to them. That civilization, however, was during the present period only in its infancy; it was not until a later epoch that the Hellenism of Apulia was developed.

Relations of the Western Italians to the Greeks

It cannot be doubted, on the other hand, that the west coast of Italy northward of Vesuvius was frequented in very early times by the Hellenes, and that there were Hellenic factories on its promontories and islands. Probably the earliest evidence of such voyages is the localizing of the legend of Odysseus on the coasts of the Tyrrhene Sea.(4) When men discovered the isles of Aeolus in the Lipari islands, when they pointed out at the Lacinian cape the isle of Calypso, at the cape of Misenum that of the Sirens, at the cape of Circeii that of Circe, when they recognized in the steep promontory of Terracina the towering burial-mound of Elpenor, when the Laestrygonians were provided with haunts near Caieta and Formiae, when the two sons of Ulysses and Circe, Agrius, that is the “wild,” and Latinus, were made to rule over the Tyrrhenians in the “inmost recess of the holy islands,” or, according to a more recent version, Latinus was called the son of Ulysses and Circe, and Auson the son of Ulysses and Calypso—we recognize in these legends ancient sailors’ tales of the seafarers of Ionia, who thought of their native home as they traversed the Tyrrhene Sea. The same noble vividness of feeling, which pervades the Ionic poem of the voyages of Odysseus, is discernible in this fresh localization of the same legend at Cumae itself and throughout the regions frequented by the Cumaeans mariners.

Page 126

Other traces of these very ancient voyages are to be found in the Greek name of the island Aethalia (Ilva, Elba), which appears to have been (after Aenaria) one of the places earliest occupied by Greeks, perhaps also in that of the seaport Telamon in Etruria; and further in the two townships on the Caerite coast, Pyrgi (near S. Severa) and Alsium (near Palo), the Greek origin of which is indicated beyond possibility of mistake not only by their names, but also by the peculiar architecture of the walls of Pyrgi, which differs essentially in character from that of the walls of Caere and the Etruscan cities generally. Aethalia, the “fire-island,” with its rich mines of copper and especially of iron, probably sustained the chief part in this commerce, and there in all likelihood the foreigners had their central settlement and seat of traffic with the natives; the more especially as they could not have found the means of smelting the ores on the small and not well-wooded island without intercourse with the mainland. The silver mines of Populonia also on the headland opposite to Elba were perhaps already known to the Greeks and wrought by them.

If, as was undoubtedly the case, the foreigners, ever in those times intent on piracy and plunder as well as trade, did not fail, when opportunity offered, to levy contributions on the natives and to carry them off as slaves, the natives on their part exercised the right of retaliation; and that the Latins and Tyrrhenes retaliated with greater energy and better fortune than their neighbours in the south of Italy, is attested not merely by the legends to that effect, but by the actual results. In these regions the Italians succeeded in resisting the foreigners and in retaining, or at any rate soon resuming, the mastery not merely of their own mercantile cities and mercantile ports, but also of their own sea. The same Hellenic invasion which crushed and denationalized the races of the south of Italy, directed the energies of the peoples of Central Italy—very much indeed against the will of their instructors—towards navigation and the founding of towns. It must have been in this quarter that the Italians first exchanged the raft and the boat for the oared galley of the Phoenicians and Greeks. Here too we first encounter great mercantile cities, particularly Caere in southern Etruria and Rome on the Tiber, which, if we may judge from their Italian names as well as from their being situated at some distance from the sea, were—like the exactly similar commercial towns at the mouth of the Po, Spina and Atria, and Ariminum further to the south—certainly not Greek, but Italian foundations. It is not in our power, as may easily be supposed, to exhibit the historical course of this earliest reaction of Italian nationality against foreign aggression; but we can still recognize the fact, which was of the greatest importance as bearing upon the further development of Italy, that this reaction took a different course in Latium and in southern Etruria from that which it exhibited in the properly Tuscan and adjoining provinces.

Page 127

Hellenes and Latins

Legend itself contrasts in a significant manner the Latin with the “wild Tyrrhenian,” and the peaceful beach at the mouth of the Tiber with the inhospitable shore of the Volsci. This cannot mean that Greek colonization was tolerated in some of the provinces of Central Italy, but not permitted in others. Northward of Vesuvius there existed no independent Greek community at all in historical times; if Pyrgi once was such, it must have already reverted, before the period at which our tradition begins, into the hands of the Italians or in other words of the Caerites. But in southern Etruria, in Latium, and likewise on the east coast, peaceful intercourse with the foreign merchants was protected and encouraged; and such was not the case elsewhere. The position of Caere was especially remarkable. “The Caerites,” says Strabo, “were held in much repute among the Hellenes for their bravery and integrity, and because, powerful though they were, they abstained from robbery.” It is not piracy that is thus referred to, for in this the merchant of Caere must have indulged like every other. But Caere was a sort of free port for Phoenicians as well as Greeks. We have already mentioned the Phoenician station—subsequently called Punicum—and the two Hellenic stations of Pyrgi and Alsium.⁽⁵⁾ It was these ports that the Caerites refrained from robbing, and it was beyond doubt through this tolerant attitude that Caere, which possessed but a wretched roadstead and had no mines in its neighbourhood, early attained so great prosperity and acquired, in reference to the earliest Greek commerce, an importance even greater than the cities of the Italians destined by nature as emporia at the mouths of the Tiber and Po. The cities we have just named are those which appear as holding primitive religious intercourse with Greece. The first of all barbarians to present gifts to the Olympian Zeus was the Tuscan king Arimnus, perhaps a ruler of Ariminum. Spina and Caere had their special treasures in the temple of the Delphic Apollo, like other communities that had regular dealings with the shrine; and the sanctuary at Delphi, as well as the Cumaean oracle, is interwoven with the earliest traditions of Caere and of Rome. These cities, where the Italians held peaceful sway and carried on friendly traffic with the foreign merchant, became preeminently wealthy and powerful, and were genuine marts not only for Hellenic merchandise, but also for the germs of Hellenic civilization.

Hellenes and Etruscans—Etruscan Maritime Power

Page 128

Matters stood on a different footing with the “wild Tyrrhenians.” The same causes, which in the province of Latium, and in the districts on the right bank of the Tiber and along the lower course of the Po that were perhaps rather subject to Etruscan supremacy than strictly Etruscan, had led to the emancipation of the natives from the maritime power of the foreigner, led in Etruria proper to the development of piracy and maritime ascendancy, in consequence possibly of the difference of national character disposing the people to violence and pillage, or it may be for other reasons with which we are not acquainted. The Etruscans were not content with dislodging the Greeks from Aethalia and Populonia; even the individual trader was apparently not tolerated by them, and soon Etruscan privateers roamed over the sea far and wide, and rendered the name of the Tyrrhenians a terror to the Greeks. It was not without reason that the Greeks reckoned the grapnel as an Etruscan invention, and called the western sea of Italy the sea of the Tuscans. The rapidity with which these wild corsairs multiplied and the violence of their proceedings in the Tyrrhene Sea in particular, are very clearly shown by their establishment on the Latin and Campanian coasts. The Latins indeed maintained their ground in Latium proper, and the Greeks at Vesuvius; but between them and by their side the Etruscans held sway in Antium and in Surrentum. The Volscians became clients of the Etruscans; their forests contributed the keels for the Etruscan galleys; and seeing that the piracy of the Antiates was only terminated by the Roman occupation, it is easy to understand why the coast of the southern Volscians bore among Greek mariners the name of the Laestrygonians. The high promontory of Sorrento with the cliff of Capri which is still more precipitous but destitute of any harbour—a station thoroughly adapted for corsairs on the watch, commanding a prospect of the Tyrrhene Sea between the bays of Naples and Salerno—was early occupied by the Etruscans. They are affirmed even to have founded a “league of twelve towns” of their own in Campania, and communities speaking Etruscan still existed in its inland districts in times quite historical. These settlements were probably indirect results of the maritime dominion of the Etruscans in the Campanian sea, and of their rivalry with the Cumaeans at Vesuvius.

Etruscan Commerce

The Etruscans however by no means confined themselves to robbery and pillage. The peaceful intercourse which they held with Greek towns is attested by the gold and silver coins which, at least from the year 200, were struck by the Etruscan cities, and in particular by Populonia, after a Greek model and a Greek standard. The circumstance, moreover, that these coins are modelled not upon those of Magna Graecia, but rather upon those of Attica and even Asia Minor, is perhaps an indication of the hostile attitude in which the

Page 129

Etruscans stood towards the Italian Greeks. For commerce they in fact enjoyed the most favourable position, far more advantageous than that of the inhabitants of Latium. Inhabiting the country from sea to sea, they commanded the great Italian free ports on the western waters, the mouths of the Po and the Venice of that time on the eastern sea, and the land route which from ancient times led from Pisa on the Tyrrhene Sea to Spina on the Adriatic, while in the south of Italy they commanded the rich plains of Capua and Nola. They were the holders of the most important Italian articles of export, the iron of Aethalia, the copper of Volaterrae and Campania, the silver of Populonia, and even the amber which was brought to them from the Baltic.(6) Under the protection of their piracy, which constituted as it were a rude navigation act, their own commerce could not fail to flourish. It need not surprise us to find Etruscan and Milesian merchants competing in the market of Sybaris, nor need we be astonished to learn that the combination of privateering and commerce on a great scale generated the unbounded and senseless luxury, in which the vigour of Etruria early wasted away.

Rivalry between the Phoenicians and Hellenes

While in Italy the Etruscans and, although in a lesser degree, the Latins thus stood opposed to the Hellenes, warding them off and partly treating them as enemies, this antagonism to some extent necessarily affected the rivalry which then above all dominated the commerce and navigation of the Mediterranean—the rivalry between the Phoenicians and Hellenes. This is not the place to set forth in detail how, during the regal period of Rome, these two great nations contended for supremacy on all the shores of the Mediterranean, in Greece even and Asia Minor, in Crete and Cyprus, on the African, Spanish, and Celtic coasts. This struggle did not take place directly on Italian soil, but its effects were deeply and permanently felt in Italy. The fresh energies and more universal endowments of the younger competitor had at first the advantage everywhere. Not only did the Hellenes rid themselves of the Phoenician factories in their own European and Asiatic homes, but they dislodged the Phoenicians also from Crete and Cyprus, gained a footing in Egypt and Cyrene, and possessed themselves of Lower Italy and the larger eastern half of the island of Sicily. On all hands the small trading stations of the Phoenicians gave way before the more energetic colonization of the Greeks. Selinus (126) and Agrigentum (174) were founded in western Sicily; the more remote western sea was traversed, Massilia was built on the Celtic coast (about 150), and the shores of Spain were explored, by the bold Phocaeans from Asia Minor. But about the middle of the second century the progress of Hellenic colonization was suddenly arrested; and there is no doubt that the cause of this arrest was the contemporary rapid

Page 130

rise of Carthage, the most powerful of the Phoenician cities in Libya—a rise manifestly due to the danger with which Hellenic aggression threatened the whole Phoenician race. If the nation which had opened up maritime commerce on the Mediterranean had been already dislodged by its younger rival from the sole command of the western half, from the possession of both lines of communication between the eastern and western basins of the Mediterranean, and from the monopoly of the carrying trade between east and west, the sovereignty at least of the seas to the west of Sardinia and Sicily might still be saved for the Orientals; and to its maintenance Carthage applied all the tenacious and circumspect energy peculiar to the Aramaean race. Phoenician colonization and Phoenician resistance assumed an entirely different character. The earlier Phoenician settlements, such as those in Sicily described by Thucydides, were mercantile factories: Carthage subdued extensive territories with numerous subjects and powerful fortresses. Hitherto the Phoenician settlements had stood isolated in opposition to the Greeks; now the powerful Libyan city centralized within its sphere the whole warlike resources of those akin to it in race with a vigour to which the history of the Greeks can produce nothing parallel.

Phoenicians and Italians in Opposition to the Hellenes

Perhaps the element in this reaction which exercised the most momentous influence in the sequel was the close relation into which the weaker Phoenicians entered with the natives of Sicily and Italy in order to resist the Hellenes. When the Cnidians and Rhodians made an attempt about 175 to establish themselves at Lilybaeum, the centre of the Phoenician settlements in Sicily, they were expelled by the natives—the Elymi of Segeste—in concert with the Phoenicians. When the Phocaeans settled about 217 at Alalia (Aleria) in Corsica opposite to Caere, there appeared for the purpose of expelling them a combined fleet of Etruscans and Carthaginians, numbering a hundred and twenty sail; and although in the naval battle that ensued—one of the earliest known in history—the fleet of the Phocaeans, which was only half as strong, claimed the victory, the Carthaginians and Etruscans gained the object which they had in view in the attack; the Phocaeans abandoned Corsica, and preferred to settle at Hyde (Velia) on the less exposed coast of Lucania. A treaty between Etruria and Carthage not only established regulations regarding the import of goods and the giving due effect to rights, but included also an alliance-in-arms (—*summachia*—), the serious import of which is shown by that very battle of Alalia. It is a significant indication of the position of the Caerites, that they stoned the Phocaean captives in the market at Caere and then sent an embassy to the Delphic Apollo to atone for the crime.

Page 131

Latium did not join in these hostilities against the Hellenes; on the contrary, we find friendly relations subsisting in very ancient times between the Romans and the Phocaeans in Velia as well as in Massilia, and the Ardeates are even said to have founded in concert with the Zacynthians a colony in Spain, the later Saguntum. Much less, however, did the Latins range themselves on the side of the Hellenes: the neutrality of their position in this respect is attested by the close relations maintained between Caere and Rome, as well as by the traces of ancient intercourse between the Latins and the Carthaginians. It was through the medium of the Hellenes that the Cannanite race became known to the Romans, for, as we have already seen,(7) they always designated it by its Greek name; but the fact that they did not borrow from the Greeks either the name for the city of Carthage(8) or the national name of the -Afri-,(9) and the circumstance that among the earlier Romans Tyrian wares were designated by the adjective -Sarranus-,(10) which in like manner precludes the idea of Greek intervention, demonstrate—what the treaties of a later period concur in proving—the direct commercial intercourse anciently subsisting between Latium and Carthage.

The combined power of the Italians and Phoenicians actually succeeded in substantially retaining the western half of the Mediterranean in their hands. The northwestern portion of Sicily, with the important ports of Soluntum and Panormus on the north coast, and Motya at the point which looks towards Africa, remained in the direct or indirect possession of the Carthaginians. About the age of Cyrus and Croesus, just when the wise Bias was endeavouring to induce the Ionians to emigrate in a body from Asia Minor and settle in Sardinia (about 200), the Carthaginian general Malchus anticipated them, and subdued a considerable portion of that important island by force of arms; half a century later, the whole coast of Sardinia appears in the undisputed possession of the Carthaginian community. Corsica on the other hand, with the towns of Alalia and Nicaea, fell to the Etruscans, and the natives paid to these tribute of the products of their poor island, pitch, wax, and honey. In the Adriatic sea, moreover, the allied Etruscans and Carthaginians ruled, as in the waters to the west of Sicily and Sardinia. The Greeks, indeed, did not give up the struggle. Those Rhodians and Cnidians, who had been driven out of Lilybaeum, established themselves on the islands between Sicily and Italy and founded there the town of Lipara (175). Massilia flourished in spite of its isolation, and soon monopolized the trade of the region from Nice to the Pyrenees. At the Pyrenees themselves Rhoda (now Rosas) was established as an offset from Lipara, and it is affirmed that Zacynthians settled in Saguntum, and even that Greek dynasts ruled at Tingis (Tangiers) in Mauretania. But the Hellenes no longer gained ground; after the foundation of Agrigentum they did

Page 132

not succeed in acquiring any important additions of territory on the Adriatic or on the western sea, and they remained excluded from the Spanish waters as well as from the Atlantic Ocean. Every year the Liparaeans had their conflicts with the Tuscan “sea-robbers,” and the Carthaginians with the Massiliots, the Cyrenaeans, and above all with the Sicilian Greeks; but no results of permanent moment were on either side achieved, and the issue of struggles which lasted for centuries was, on the whole, the simple maintenance of the -status quo-.

Thus Italy was—if but indirectly—indebted to the Phoenicians for the exemption of at least her central and northern provinces from colonization, and for the counter-development of a national maritime power there, especially in Etruria. But there are not wanting indications that the Phoenicians already found it worth while to manifest that jealousy which is usually associated with naval domination, if not in reference to their Latin allies, at any rate in reference to their Etruscan confederates, whose naval power was greater. The statement as to the Carthaginians having prohibited the sending forth of an Etruscan colony to the Canary islands, whether true or false, reveals the existence of a rivalry of interests in the matter.

Notes for Book I Chapter X

1. Whether the name of Graeci was originally associated with the interior of Epirus and the region of Dodona, or pertained rather to the Aetolians who perhaps earlier reached the western sea, may be left an open question; it must at a remote period have belonged to a prominent stock or aggregate of stocks of Greece proper and have passed over from these to the nation as a whole. In the *Eoai* of Hesiod it appears as the older collective name for the nation, although it is manifest that it is intentionally thrust aside and subordinated to that of Hellenes. The latter does not occur in Homer, but, in addition to Hesiod, it is found in Archilochus about the year 50, and it may very well have come into use considerably earlier (Duncker, *Gesch. d. Alt.* iii. 18, 556). Already before this period, therefore, the Italians were so widely acquainted with the Greeks that that name, which early fell into abeyance in Hellas, was retained by them as a collective name for the Greek nation, even when the latter itself adopted other modes of self-designation. It was withal only natural that foreigners should have attained to an earlier and clearer consciousness of the fact that the Hellenic stocks belonged to one race than the latter themselves, and that hence the collective designation should have become more definitely fixed among the former than with the latter—not the less, that it was not taken directly from the well-known Hellenes who dwelt the nearest to them. It is difficult to see how we can reconcile with this fact the statement that a century before the foundation of Rome Italy was still quite unknown to the Greeks of Asia Minor. We shall speak of the alphabet below; its history yields entirely similar results. It may perhaps be characterized as a rash step to reject the

statement of Herodotus respecting the age of Homer on the strength of such considerations; but is there no rashness in following implicitly the guidance of tradition in questions of this kind?

Page 133

2. Thus the three old Oriental forms of the —“id:i” (—“id:S”), —“id:l” (—“id:Λ”) and —“id:r” (—“id:P”), for which as apt to be confounded with the forms of the —“id:s”, —“id:g”, and —“id:p” the signs —“id:l”) —“id:L” —“id:R”) were early proposed to be substituted, remained either in exclusive or in very preponderant use among the Achaean colonies, while the other Greeks of Italy and Sicily without distinction of race used exclusively or at any rate chiefly the more recent forms.

3. E. g. the inscription on an earthen vase of Cumae runs thus:—Tataies emi lequthos Fos d’ an me klephsei thuphlos estai—.

4. Among Greek writers this Tyrrhene legend of Odysseus makes its earliest appearance in the Theogony of Hesiod, in one of its more recent sections, and thereafter in authors of the period shortly before Alexander, Ephorus (from whom the so-called Scymnus drew his materials), and the writer known as Scylax. The first of these sources belongs to an age when Italy was still regarded by the Greeks as a group of islands, and is certainly therefore very old; so that the origin of these legends may, on the whole, be confidently placed in the regal period of Rome.

5. I. X. Phoenicians in Italy, I. X. Relations of the Western Italians to the Greeks

6. I. X. Relations of Italy with Other Lands

7. I. X. Phoenicians in Italy

8. The Phoenician name was Karthada; the Greek, Karchedon; the Roman, Cartago.

9. The name -Afri-, already current in the days of Ennius and Cato (comp. -Scipio Africanus-), is certainly not Greek, and is most probably cognate with that of the Hebrews.

10. The adjective -Sarranus- was from early times applied by the Romans to the Tyrian purple and the Tyrian flute; and -Sarranus- was in use also as a surname, at least from the time of the war with Hannibal. -Sarra-, which occurs in Ennius and Plautus as the name of the city, was perhaps formed from -Sarranus-, not directly from the native name -Sor-. The Greek form, -Tyrus-, -Tyrius-, seems not to occur in any Roman author anterior to Afranius (ap. Fest. p. 355 M.). Compare Movers, Phon. ii. x, 174.

CHAPTER XI

Law and Justice

Modern Character of Italian Culture

History, as such, cannot reproduce the life of a people in the infinite variety of its details; it must be content with exhibiting the development of that life as a whole. The doings and dealings, the thoughts and imaginings of the individual, however strongly they may reflect the characteristics of the national mind, form no part of history. Nevertheless it seems necessary to make some attempt to indicate—only in the most general outlines—the features of individual life in the case of those earlier ages which are, so far as history is concerned, all but

Page 134

lost in oblivion; for it is in this field of research alone that we acquire some idea of the breadth of the gulf which separates our modes of thinking and feeling from those of the civilized nations of antiquity. Tradition, with its confused mass of national names and its dim legends, resembles withered leaves which with difficulty we recognize to have once been green. Instead of threading that dreary maze and attempting to classify those shreds of humanity, the Chones and Oenotrians, the Siculi and the Pelasgi, it will be more to the purpose to inquire how the real life of the people in ancient Italy expressed itself in their law, and their ideal life in religion; how they farmed and how they traded; and whence the several nations derived the art of writing and other elements of culture. Scanty as our knowledge in this respect is in reference to the Roman people and still more so in reference to the Sabellians and Etruscans, even the slight and very defective information which is attainable will enable the mind to associate with these names some more or less clear glimpse of the once living reality. The chief result of such a view (as we may here mention by way of anticipation) may be summed up in saying that fewer traces comparatively of the primitive state of things have been preserved in the case of the Italians, and of the Romans in particular, than in the case of any other Indo-Germanic race. The bow and arrow, the war-chariot, the incapacity of women to hold property, the acquiring of wives by purchase, the primitive form of burial, blood-revenge, the clan-constitution conflicting with the authority of the community, a vivid natural symbolism—all these, and numerous phenomena of a kindred character, must be presumed to have lain at the foundation of civilization in Italy as well as elsewhere; but at the epoch when that civilization comes clearly into view they have already wholly disappeared, and only the comparison of kindred races informs us that such things once existed. In this respect Italian history begins at a far later stage of civilization than e.g. the Greek or the Germanic, and from the first it exhibits a comparatively modern character.

The laws of most of the Italian stocks are lost in oblivion. Some information regarding the law of the Latin land alone has survived in Roman tradition.

Jurisdiction

All jurisdiction was vested in the community or, in other words, in the king, who administered justice or “command” (-ius-) on the “days of utterance” (-dies fasti-) at the “judgment platform” (-tribunal-) in the place of public assembly, sitting on the “chariot-seat” (-sella curulis-);(1) by his side stood his “messengers” (-lictiores-), and before him the person accused or the “parties” (-rei-). No doubt in the case of slaves the decision lay primarily with the master, and in the case of women with the father, husband, or nearest male relative;(2) but slaves and

Page 135

women were not primarily reckoned as members of the community. Over sons and grandsons who were -in potestate- the power of the -pater familias- subsisted concurrently with the royal jurisdiction; that power, however, was not a jurisdiction in the proper sense of the term, but simply a consequence of the father's inherent right of property in his children. We find no traces of any jurisdiction appertaining to the clans as such, or of any judicature at all that did not derive its authority from the king. As regards the right of self-redress and in particular the avenging of blood, we still find perhaps in legends an echo of the original principle that a murderer, or any one who should illegally protect a murderer, might justifiably be slain by the kinsmen of the person murdered; but these very legends characterize this principle as objectionable,(3) and from their statements blood-revenge would appear to have been very early suppressed in Rome through the energetic assertion of the authority of the community. In like manner we perceive in the earliest Roman law no trace of that influence which under the oldest Germanic institutions the comrades of the accused and the people present were entitled to exercise over the pronouncing of judgment; nor do we find in the former any evidence of the usage so frequent in the latter, by which the mere will and power to maintain a claim with arms in hand were treated as judicially necessary or at any rate admissible.

Crimes

Judicial procedure took the form of a public or a private process, according as the king interposed of his own motion or only when appealed to by the injured party. The former course was taken only in cases which involved a breach of the public peace. First of all, therefore, it was applicable in the case of public treason or communion with the public enemy (-proditio-), and in that of violent rebellion against the magistracy (-perduellio-). But the public peace was also broken by the foul murderer (-parricida-), the sodomite, the violator of a maiden's or matron's chastity, the incendiary, the false witness, by those, moreover, who with evil spells conjured away the harvest, or who without due title cut the corn by night in the field entrusted to the protection of the gods and of the people; all of these were therefore dealt with as though they had been guilty of high treason. The king opened and conducted the process, and pronounced sentence after conferring with the senators whom he had called in to advise with him. He was at liberty, however, after he had initiated the process, to commit the further handling and the adjudication of the matter to deputies who were, as a rule, taken from the senate. The later extraordinary deputies, the two men for adjudicating on rebellion (-duoviri perduellionis-) and the later standing deputies the "trackers of murder" (-quaestores parricidii-) whose primary duty was to search out and arrest murderers,

Page 136

and who therefore exercised in some measure police functions, do not belong to the regal period, but may probably have sprung out of, or been suggested by, certain of its institutions. Imprisonment while the case was undergoing investigation was the rule; the accused might, however, be released on bail. Torture to compel confession was only applied to slaves. Every one convicted of having broken the public peace expiated his offence with his life. The modes of inflicting capital punishment were various: the false witness, for example, was hurled from the stronghold-rock; the harvest-thief was hanged; the incendiary was burnt. The king could not grant pardon, for that power was vested in the community alone; but the king might grant or refuse to the condemned permission to appeal for mercy (-provocatio-). In addition to this, the law recognized an intervention of the gods in favour of the condemned criminal. He who had made a genuflection before the priest of Jupiter might not be scourged on the same day; any one under fetters who set foot in his house had to be released from his bonds; and the life of a criminal was spared, if on his way to execution he accidentally met one of the sacred virgins of Vesta.

Punishment of Offenses against Order

The king inflicted at his discretion fines payable to the state for trespasses against order and for police offences; they consisted in a definite number (hence the name -multa-) of cattle or sheep. It was in his power also to pronounce sentence of scourging.

Law of Private Offenses

In all other cases, where the individual alone was injured and not the public peace, the state only interposed upon the appeal of the party injured, who caused his opponent, or in case of need by laying violent hands on him compelled him, to appear personally along with himself before the king. When both parties had appeared and the plaintiff had orally stated his demand, while the defendant had in similar fashion refused to comply with it, the king might either investigate the cause himself or have it disposed of by a deputy acting in his name. The regular form of satisfaction for such an injury was a compromise arranged between the injurer and the injured; the state only interfered supplementarily, when the aggressor did not satisfy the party aggrieved by an adequate expiation (-poena-), when any one had his property detained or his just demand was not fulfilled.

Theft

Under what circumstances during this epoch theft was regarded as at all expiable, and what in such an event the person injured was entitled to demand from the thief, cannot be ascertained. But the injured party with reason demanded heavier compensation from a thief caught in the very act than from one detected afterwards, since the feeling of exasperation which had to be appeased was more vehement in the case of the former than in that of the latter. If the theft appeared incapable of expiation, or if the thief was not in a position to pay the value demanded by the injured party and approved by the judge, he was by the judge assigned as a bondsman to the person from whom he had stolen.

Page 137

Injuries

In cases of damage (-iniuria-) to person or to property, where the injury was not of a very serious description, the aggrieved party was probably obliged unconditionally to accept compensation; if, on the other hand, any member was lost in consequence of it, the maimed person could demand eye for eye and tooth for tooth.

Property

Since the arable land among the Romans was long cultivated upon the system of joint possession and was not distributed until a comparatively late age, the idea of property was primarily associated not with immoveable estate, but with "estate in slaves and cattle" (-familia pecuniaque-). It was not the right of the stronger that was regarded as the foundation of a title to it; on the contrary, all property was considered as conferred by the community upon the individual burgess for his exclusive possession and use; and therefore it was only the burgess, and such as the community accounted in this respect as equal to burgesses, that were capable of holding property. All property passed freely from hand to hand. The Roman law made no substantial distinction between moveable and immoveable estate (from the time that the latter was regarded as private property at all), and recognized no absolute vested interest of children or other relatives in the paternal or family property. Nevertheless it was not in the power of the father arbitrarily to deprive his children of their right of inheritance, because he could neither dissolve the paternal power nor execute a testament except with consent of the whole community, which might be, and certainly under such circumstances often was, refused. In his lifetime no doubt the father might make dispositions disadvantageous to his children; for the law was sparing of personal restrictions on the proprietor and allowed, upon the whole, every grown-up man freely to dispose of his property. The regulation, however, under which he who alienated his hereditary property and deprived his children of it was placed by order of the magistrate under guardianship like a lunatic, was probably as ancient as the period when the arable land was first divided and thereby private property generally acquired greater importance for the commonwealth. In this way the two antagonistic principles—the unlimited right of the owner to dispose of his own, and the preservation of the family property unbroken—were as far as possible harmonized in the Roman law. Permanent restrictions on property were in no case allowed, with the exception of servitudes such as those indispensable in husbandry. Heritable leases and ground-rents charged upon property could not legally exist. The law as little recognized mortgaging; but the same purpose was served by the immediate delivery of the property in pledge to the creditor as if he were its purchaser, who thereupon gave his word of honour (-fiducia-) that he would not alienate the object pledged until the payment fell due, and would restore it to his debtor when the sum advanced had been repaid.

Page 138

Contracts

Contracts concluded between the state and a burgess, particularly the obligation given by those who became sureties for a payment to the state (-praevides-, -praedes-), were valid without further formality. On the other hand, contracts between private persons under ordinary circumstances gave no claim for legal aid on the part of the state. The only protection of the creditor was the debtor's word of honour which was held in high esteem after the wont of merchants, and possibly also, in those frequent cases where an oath had been added, the fear of the gods who avenged perjury. The only contracts legally actionable were those of betrothal (the effect of which was that the father, in the event of his failing to give the promised bride, had to furnish satisfaction and compensation), of purchase (-mancipatio-), and of loan (-nexum-). A purchase was held to be legally concluded when the seller delivered the article purchased into the hand of the buyer (-mancipare-) and the buyer at the same time paid to the seller the stipulated price in presence of witnesses. This was done, after copper superseded sheep and cattle as the regular standard of value, by weighing out the stipulated quantity of copper in a balance adjusted by a neutral person.(4) These conditions having been complied with, the seller had to answer for his being the owner, and in addition seller and purchaser had to fulfil every stipulation specially agreed on; the party failing to do so made reparation to the other, just as if he had deprived him of the article in question. But a purchase only founded an action in the event of its being a transaction for ready money: a purchase on credit neither gave nor took away the right of property, and constituted no ground of action. A loan was negotiated in a similar way; the creditor weighed over to the debtor in presence of witnesses the stipulated quantity of copper under the obligation (-nexum-) of repayment. In addition to the capital the debtor had to pay interest, which under ordinary circumstances probably amounted to ten per cent per annum.(5) The repayment of the loan took place, when the time came, with similar forms.

Private Process

If a debtor to the state did not fulfil his obligations, he was without further ceremony sold with all that he had; the simple demand on the part of the state was sufficient to establish the debt. If on the other hand a private person informed the king of any violation of his property (-vindiciae-) or if repayment of the loan received did not duly take place, the procedure depended on whether the facts relating to the cause needed to be established, which was ordinarily the case with actions as to property, or were already clearly apparent, which in the case of actions as to loans could easily be accomplished according to the current rules of law by means of the witnesses.

Page 139

The establishment of the facts assumed the form of a wager, in which each party made a deposit (-sacramentum-) against the contingency of his being worsted; in important causes when the value involved was greater than ten oxen, a deposit of five oxen, in causes of less amount, a deposit of five sheep. The judge then decided who had gained the wager, whereupon the deposit of the losing party fell to the priests for behoof of the public sacrifices. The party who lost the wager and allowed thirty days to elapse without giving due satisfaction to his opponent, and the party whose obligation to pay was established from the first—consequently, as a rule, the debtor who had got a loan and had not witnesses to attest its repayment—became liable to proceedings in execution “by laying on of hands” (-manus iniectio-); the plaintiff seized him wherever he found him, and brought him to the bar of the judge simply to satisfy the acknowledged debt. The party seized was not allowed to defend himself; a third person might indeed intercede for him and represent this act of violence as unwarranted (-vindex-), in which case the proceedings were stayed; but such an intercession rendered the intercessor personally responsible, for which reason the proletarian could not be intercessor for the tribute-paying burgess. If neither satisfaction nor intercession took place, the king adjudged the party seized to his creditor, so that the latter could lead him away and keep him like a slave. After the expiry of sixty days during which the debtor had been three times exposed in the market-place and proclamation had been made to ascertain whether any one would have compassion upon him, if these steps were without effect, his creditors had the right to put him to death and to divide his carcase, or to sell him with his children and his effects into foreign slavery, or to keep him at home in a slave’s stead; for such an one could not by the Roman law, so long as he remained within the bounds of the Roman community, become completely a slave.(6) Thus the Roman community protected every man’s estate and effects with unrelenting rigour as well from the thief and the injurer, as from the unauthorized possessor and the insolvent debtor.

Guardianship

Protection was in like manner provided for the estate of persons not capable of bearing arms and therefore not capable of protecting their own property, such as minors and lunatics, and above all for that of women; in these cases the nearest heirs were called to undertake the guardianship.

Law of Inheritance

Page 140

After a man's death his property fell to the nearest heirs: in the division all who were equal in proximity of relationship—women included—shared alike, and the widow along with her children was admitted to her proportional share. A dispensation from the legal order of succession could only be granted by the assembly of the people; previous to which the consent of the priests had to be obtained on account of the ritual obligations attaching to succession. Such dispensations appear nevertheless to have become at an early period very frequent. In the event of a dispensation not being procured, the want of it might be in some measure remedied by means of the completely free control which every one had over his property during his lifetime. His whole property was transferred to a friend, who distributed it after death according to the wishes of the deceased.

Manumission

Manumission was unknown to the law of very early times. The owner might indeed refrain from exercising his proprietary rights; but this did not cancel the existing impossibility of master and slave coming under mutual obligations; still less did it enable the slave to acquire, in relation to the community, the rights of a guest or of a burgess. Accordingly manumission must have been at first simply -de facto-, not -de jure-; and the master cannot have been debarred from the possibility of again at pleasure treating the freedman as a slave. But there was a departure from this principle in cases where the master came under obligation not merely towards the slave, but towards the community, to leave him in possession of freedom. There was no special legal form, however, for thus binding the master—the best proof that there was at first no such thing as a manumission,—but those methods were employed for this object which the law otherwise presented, testament, action, or census. If the master had either declared his slave free when executing his last will in the assembly of the people, or had allowed his slave to claim freedom in his own presence before a judge or to get his name inscribed in the valuation-roll, the freedman was regarded not indeed as a burgess, but as personally free in relation to his former master and his heirs, and was accordingly looked upon at first as a client, and in later times as a plebeian.(7)

The emancipation of a son encountered greater difficulties than that of a slave; for while the relation of master to slave was accidental and therefore capable of being dissolved at will, the father could never cease to be father. Accordingly in later times the son was obliged, in order to get free from the father, first to enter into slavery and then to be set free out of this latter state; but in the period now before us no emancipation of sons can have as yet existed.

Clients and Foreigners

Page 141

Such were the laws under which burgesses and clients lived in Rome. Between these two classes, so far as we can see, there subsisted from the beginning complete equality of private rights. The foreigner on the other hand, if he had not submitted to a Roman patron and thus lived as a client, was beyond the pale of the law both in person and in property. Whatever the Roman burgess took from him was as rightfully acquired as was the shellfish, belonging to nobody, which was picked up by the sea-shore; but in the case of ground lying beyond the Roman bounds, while the Roman burgess might take practical possession, he could not be regarded as in a legal sense its proprietor; for the individual burgess was not entitled to advance the bounds of the community. The case was different in war: whatever the soldier who was fighting in the ranks of the levy gained, whether moveable or immoveable property, fell not to him, but to the state, and accordingly here too it depended upon the state whether it would advance or contract its bounds.

Exceptions from these general rules were created by special state-treaties, which secured certain rights to the members of foreign communities within the Roman state. In particular, the perpetual league between Rome and Latium declared all contracts between Romans and Latins to be valid in law, and at the same time instituted in their case an accelerated civil process before sworn “recoverers” (-recipitatores-). As, contrary to Roman usage, which in other instances committed the decision to a single judge, these always sat in plural number and that number uneven, they are probably to be conceived as a court for the cognizance of commercial dealings, composed of arbiters from both nations and an umpire. They sat in judgment at the place where the contract was entered into, and were obliged to have the process terminated at latest in ten days. The forms, under which the dealings between Romans and Latins were conducted, were of course the general forms which regulated the mutual dealings of patricians and plebeians; for the -mancipatio- and the -nexum- were originally not at all formal acts, but the significant expression of legal ideas which held a sway at least as extensive as the range of the Latin language.

Dealings with countries strictly foreign were carried on in a different fashion and by means of other forms. In very early times treaties as to commerce and legal redress must have been entered into with the Caerites and other friendly peoples, and must have formed the basis of the international private law (-ius gentium-), which gradually became developed in Rome alongside of the law of the land. An indication of the formation of such a law is found in the remarkable -mutuum-, “the exchange” (from -mutare- like -dividuus-)—a form of loan, which was not based like the -nexum-upon a binding declaration of the debtor expressly emitted before witnesses, but upon the mere transit of the money from one hand

Page 142

to another, and which as evidently originated in dealings with foreigners as the -nexum- in business dealings at home. It is accordingly a significant fact that the word reappears in Sicilian Greek as —moiton—; and with this is to be connected the reappearance of the Latin -carcer- in the Sicilian —karkaron—. Since it is philologically certain that both words were originally Latin, their occurrence in the local dialect of Sicily becomes an important testimony to the frequency of the dealings of Latin traders in the island, which led to their borrowing money there and becoming liable to that imprisonment for debt, which was everywhere in the earlier systems of law the consequence of the non-repayment of a loan. Conversely, the name of the Syracusan prison, “stone-quarries” or —latomiaí—, was transferred at an early period to the enlarged Roman state-prison, the -lautumiae-.

Character of the Roman Law

We have derived our outline of these institutions mainly from the earliest record of the Roman common law prepared about half a century after the abolition of the monarchy; and their existence in the regal period, while doubtful perhaps as to particular points of detail, cannot be doubted in the main. Surveying them as a whole, we recognize the law of a far-advanced agricultural and mercantile city, marked alike by its liberality and its consistency. In its case the conventional language of symbols, such as e. g. the Germanic laws exhibit, has already quite disappeared. There is no doubt that such a symbolic language must have existed at one time among the Italians. Remarkable instances of it are to be found in the form of searching a house, wherein the searcher must, according to the Roman as well as the Germanic custom, appear without upper garment merely in his shirt; and especially in the primitive Latin formula for declaring war, in which we meet with two symbols occurring at least also among the Celts and the Germans—the “pure herb” (-herba pura-, Franconian -chrene chruda-) as a symbol of the native soil, and the singed bloody staff as a sign of commencing war. But with a few exceptions, in which reasons of religion protected the ancient usages—to which class the -confarreatio-as well as the declaration of war by the college of Fetiales belonged—the Roman law, as we know it, uniformly and on principle rejects the symbol, and requires in all cases neither more nor less than the full and pure expression of will. The delivery of an article, the summons to bear witness, the conclusion of marriage, were complete as soon as the parties had in an intelligible manner declared their purpose; it was usual, indeed, to deliver the article into the hand of the new owner, to pull the person summoned as a witness by the ear, to veil the bride’s head and to lead her in solemn procession to her husband’s house; but all these primitive practices were already, under the oldest national law of the Romans, customs legally

Page 143

worthless. In a way entirely analogous to the setting aside of allegory and along with it of personification in religion, every sort of symbolism was on principle expelled from their law. In like manner that earliest state of things presented to us by the Hellenic as well as the Germanic institutions, wherein the power of the community still contends with the authority of the smaller associations of clans or cantons that are merged in it, is in Roman law wholly superseded; there is no alliance for the vindication of rights within the state, to supplement the state's imperfect aid, by mutual offence and defence; nor is there any serious trace of vengeance for bloodshed, or of the family property restricting the individual's power of disposal. Such institutions must probably at one time have existed among the Italians; traces of them may perhaps be found in particular institutions of ritual, e. g. in the expiatory goat, which the involuntary homicide was obliged to give to the nearest of kin to the slain; but even at the earliest period of Rome which we can conceive this stage had long been transcended. The clan and the family doubtless were not annihilated in the Roman community; but the theoretical as well as the practical omnipotence of the state in its own sphere was no more limited by them than by the freedom which the state granted and guaranteed to the burgess. The ultimate foundation of law was in all cases the state; freedom was simply another expression for the right of citizenship in its widest sense; all property was based on express or tacit transference by the community to the individual; a contract was valid only so far as the community by its representatives attested it, a testament only so far as the community confirmed it. The provinces of public and private law were definitely and clearly discriminated: the former having reference to crimes against the state, which immediately called for the judgment of the state and always involved capital punishment; the latter having reference to offences against a fellow-burgess or a guest, which were mainly disposed of in the way of compromise by expiation or satisfaction made to the party injured, and were never punished with the forfeit of life, but, at most, with the loss of freedom. The greatest liberality in the permission of commerce and the most rigorous procedure in execution went hand in hand; just as in commercial states at the present day the universal right to draw bills of exchange appears in conjunction with a strict procedure in regard to them. The burgess and the client stood in their dealings on a footing of entire equality; state-treaties conceded a comprehensive equality of rights also to the guest; women were placed completely on a level in point of legal capacity with men, although restricted in action; the boy had scarcely grown up when he received at once the most comprehensive powers in the disposal of his estate, and every one who could dispose at all was as sovereign in his own sphere

Page 144

as was the state in public affairs. A feature eminently characteristic was the system of credit. There did not exist any credit on landed security, but instead of a debt on mortgage the step which constitutes at present the final stage in mortgage-procedure—the delivery of the property from the debtor to the creditor—took place at once. On the other hand personal credit was guaranteed in the most summary, not to say extravagant fashion; for the lawgiver entitled the creditor to treat his insolvent debtor like a thief, and granted to him in entire legislative earnest what Shylock, half in jest, stipulated for from his mortal enemy, guarding indeed by special clauses the point as to the cutting off too much more carefully than did the Jew. The law could not have more clearly expressed its design, which was to establish at once an independent agriculture free of debt and a mercantile credit, and to suppress with stringent energy all merely nominal ownership and all breaches of fidelity. If we further take into consideration the right of settlement recognized at an early date as belonging to all the Latins,(8) and the validity which was likewise early pronounced to belong to civil marriage,(9) we shall perceive that this state, which made the highest demands on its burgesses and carried the idea of subordinating the individual to the interest of the whole further than any state before or since has done, only did and only could do so by itself removing the barriers to intercourse and unshackling liberty quite as much as it subjected it to restriction. In permission or in prohibition the law was always absolute. As the foreigner who had none to intercede for him was like the hunted deer, so the guest was on a footing of equality with the burgess. A contract did not ordinarily furnish a ground of action, but where the right of the creditor was acknowledged, it was so all-powerful that there was no deliverance for the poor debtor, and no humane or equitable consideration was shown towards him. It seemed as if the law found a pleasure in presenting on all sides its sharpest spikes, in drawing the most extreme consequences, in forcibly obtruding on the bluntest understanding the tyrannic nature of the idea of right. The poetical form and the genial symbolism, which so pleasingly prevail in the Germanic legal ordinances, were foreign to the Roman; in his law all was clear and precise; no symbol was employed, no institution was superfluous. It was not cruel; everything necessary was performed without much ceremony, even the punishment of death; that a free man could not be tortured was a primitive maxim of Roman law, to obtain which other peoples have had to struggle for thousands of years. Yet this law was frightful in its inexorable severity, which we cannot suppose to have been very greatly mitigated by humanity in practice, for it was really the law of the people; more terrible than Venetian -piombi- and chambers of torture was that series of living entombments which the poor man saw yawning before him in the debtors' towers of the rich. But the greatness of Rome was involved in, and was based upon, the fact that the Roman people ordained for itself and endured a system of law, in which the eternal principles of freedom and of subordination, of property and of legal redress, reigned and still at the present day reign unadulterated and unmodified.

Page 145

Notes for Book I Chapter XI

1. This "chariot-seat"—philologically no other explanation can well be given (comp. Servius ad Aen. i. 16)—is most simply explained by supposing that the king alone was entitled to ride in a chariot within the city (v. The King)—whence originated the privilege subsequently accorded to the chief magistrate on solemn occasions—and that originally, so long as there was no elevated tribunal, he gave judgment, at the comitium or wherever else he wished, from the chariot-seat.

2. I. V. The Housefather and His Household

3. The story of the death of king Tatius, as given by Plutarch (Rom. 23, 24), viz. that kinsmen of Tatius had killed envoys from Laurentum; that Tatius had refused the complaint of the kinsmen of the slain for redress; that they then put Tatius to death; that Romulus acquitted the murderers of Tatius, on the ground that murder had been expiated by murder; but that, in consequence of the penal judgments of the gods that simultaneously fell upon Rome and Laurentum, the perpetrators of both murders were in the sequel subjected to righteous punishment—this story looks quite like a historical version of the abolition of blood-revenge, just as the introduction of the -provocatio- lies at the foundation of the myth of the Horatii. The versions of the same story that occur elsewhere certainly present considerable variations, but they seem to be confused or dressed up.

4. The -mancipatio- in its developed form must have been more recent than the Servian reform, as the selection of mancipable objects, which had for its aim the fixing of agricultural property, shows, and as even tradition must have assumed, for it makes Servius the inventor of the balance. But in its origin the -mancipatio- must be far more ancient; for it primarily applies only to objects which are acquired by grasping with the hand, and must therefore in its earliest form have belonged to the epoch when property consisted essentially in slaves and cattle (-familia pecuniaque-). The enumeration of those objects which had to be acquired by -mancipatio-, falls accordingly to be ranked as a Servian innovation; the -mancipatio-itself, and consequently the use also of the balance and of copper, are older. Beyond doubt -mancipatio- was originally the universal form of purchase, and occurred in the case of all articles even after the Servian reform; it was only a misunderstanding of later ages which put upon the rule, that certain articles had to be transferred by -mancipatio-, the construction that these articles only and no others could be so transferred.

5. Viz. for the year of ten months one twelfth part of the capital (-uncia-), which amounts to $8 \frac{1}{3}$ per cent for the year of ten, and 10 per cent for the year of twelve months.

CHAPTER XII

Religion

Roman Religion

The Roman world of gods, as we have already indicated,(1) was a higher counterpart, an ideal reflection, of the earthly Rome, in which the little and the great were alike repeated with painstaking exactness. The state and the clan, the individual phenomenon of nature as well as the individual mental operation, every man, every place and object, every act even falling within the sphere of Roman law, reappeared in the Roman world of gods; and, as earthly things come and go in perpetual flux, the circle of the gods underwent a corresponding fluctuation. The tutelary spirit, which presided over the individual act, lasted no longer than that act itself: the tutelary spirit of the individual man lived and died with the man; and eternal duration belonged to divinities of this sort only in so far as similar acts and similarly constituted men and therefore spirits of a similar kind were ever coming into existence afresh. As the Roman gods ruled over the Roman community, so every foreign community was presided over by its own gods; but sharp as was the distinction between the burgess and non-burgess, between the Roman and the foreign god, both foreign men and foreign divinities could be admitted by resolution of the community to the freedom of Rome, and when the citizens of a conquered city were transported to Rome, the gods of that city were also invited to take up their new abode there.

Oldest Table of Roman Festivals

We obtain information regarding the original cycle of the gods, as it stood in Rome previous to any contact with the Greeks, from the list of the public and duly named festival-days (-feriae publicae-) of the Roman community, which is preserved in its calendar and is beyond all question the oldest document which has reached us from Roman antiquity. The first place in it is occupied by the gods Jupiter and Mars along with the duplicate of the latter, Quirinus. To Jupiter all the days of full moon (-idus-) are sacred, besides all the wine-festivals and various other days to be mentioned afterwards; the 21st May (-agonalia-) is dedicated to his counterpart, the “bad Jovis” (-Ve-diovis-). To Mars belongs the new-year of the 1st March, and generally the great warrior-festival in this month which derived its very name from the god; this festival, introduced by the horse-racing (-equirria-) on the 27th February, had during March its

principal solemnities on the days of the shield-forging (-equirria- or -Mamuralia-, March 14), of the armed dance at the Comitium (-quinquatrus-, March 19), and of the consecration of trumpets (-tubilustrium-, March 23). As, when a war was to be waged, it began

Page 147

with this festival, so after the close of the campaign in autumn there followed a further festival of Mars, that of the consecration of arms (-armilustrium-, October 19). Lastly, to the second Mars, Quirinus, the 17th February was appropriated (-Quirinalia-). Among the other festivals those which related to the culture of corn and wine hold the first place, while the pastoral feasts play a subordinate part. To this class belongs especially the great series of spring-festivals in April, in the course of which sacrifices were offered on the 15th to Tellus, the nourishing earth (-fordicidia-, sacrifice of the pregnant cow), on the 19th to Ceres, the goddess of germination and growth (-Cerialia-) on the 21st to Pales, the fecundating goddess of the flocks (-Parilia-), on the 23rd to Jupiter, as the protector of the vines and of the vats of the previous year's vintage which were first opened on this day (-Vinalia-), and on the 25th to the bad enemy of the crops, rust (-Robigus-: -Robigalia-). So after the completion of the work of the fields and the fortunate ingathering of their produce double festivals were celebrated in honour of the god and goddess of inbringing and harvest, Censu (from -condere-) and Ops; the first, immediately after the completion of cutting (August 21, -Consualia-; August 25, -Opiconsiva-); and the second, in the middle of winter, when the blessings of the granary are especially manifest (December 15, -Consualia-; December 19, -Opalia-); between these two latter days the thoughtfulness of the old arrangers of the festivals inserted that of seed-sowing (Saturnalia from -Saeturnus- or -Saturnus-, December 17). In like manner the festival of must or of healing (-meditrinalia-, October 11), so called because a healing virtue was attributed to the fresh must, was dedicated to Jovis as the wine-god after the completion of the vintage; the original reference of the third wine-feast (-Vinalia-, August 19) is not clear. To these festivals were added at the close of the year the wolf-festival (-Lupercalia-, February 17) of the shepherds in honour of the good god, Faunus, and the boundary-stone festival (-Terminalia-, February 23) of the husbandmen, as also the summer grove-festival of two days (-Lucaria-, July 19, 21) which may have had reference to the forest-gods (-Silvani-), the fountain-festival (-Fontinalia-, October 13), and the festival of the shortest day, which brings in the new sun (-An-geronalia-, -Divalia-, December 21).

Of not less importance—as was to be expected in the case of the port of Latium—were the mariner-festivals of the divinities of the sea (-Neptunalia-, July 23), of the harbour (-Portunalia-, August 17), and of the Tiber stream (-Voturnalia-, August 27).

Handicraft and art, on the other hand, are represented in this cycle of the gods only by the god of fire and of smith's work, Vulcanus, to whom besides the day named after him (-Volcanalia-, August 23) the second festival of the consecration of trumpets was dedicated (-tubilustrium-, May 23), and eventually also by the festival of Carmentis (-Carmentalia- January 11, 15), who probably was adored originally as the goddess of spells and of song and only inferentially as protectress of births.

Page 148

Domestic and family life in general were represented by the festival of the goddess of the house and of the spirits of the storechamber, Vesta and the Penates (-Vestalia-, June 9); the festival of the goddess of birth(2) (-Matralia-, June 11); the festival of the blessing of children, dedicated to Liber and Libera (-Liberalia-, March 17), the festival of departed spirits (-Feralia-, February 21), and the three days' ghost-celebration (-Lemuria- May 9, 11, 13); while those having reference to civil relations were the two—otherwise to us somewhat obscure—festivals of the king's flight (-Regifugium-, February 24) and of the people's flight (-Poplifugia-, July 5), of which at least the last day was devoted to Jupiter, and the festival of the Seven Mounts (-Agonia- or -Septimontium-, December 11). A special day (-agonia-, January 9) was also consecrated to Janus, the god of beginning. The real nature of some other days—that of Furrina (July 25), and that of the Larentalia devoted to Jupiter and Acca Larentia, perhaps a feast of the Lares (December 23)—is no longer known.

This table is complete for the immoveable public festivals; and—although by the side of these standing festal days there certainly occurred from the earliest times changeable and occasional festivals—this document, in what it says as well as in what it omits, opens up to us an insight into a primitive age otherwise almost wholly lost to us. The union of the Old Roman community and the Hill-Romans had indeed already taken place when this table of festivals was formed, for we find in it Quirinus alongside of Mars; but, when this festival-list was drawn up, the Capitoline temple was not yet in existence, for Juno and Minerva are absent; nor was the temple of Diana erected on the Aventine; nor was any notion of worship borrowed from the Greeks.

Mars and Jupiter

The central object not only of Roman but of Italian worship generally in that epoch when the Italian stock still dwelt by itself in the peninsula was, according to all indications, the god Maurs or Mars, the killing god,(3) preeminently regarded as the divine champion of the burgesses, hurling the spear, protecting the flock, and overthrowing the foe. Each community of course possessed its own Mars, and deemed him to be the strongest and holiest of all; and accordingly every “-ver sacrum-” setting out to found a new community marched under the protection of its own Mars. To Mars was dedicated the first month not only in the Roman calendar of the months, which in no other instance takes notice of the gods, but also probably in all the other Latin and Sabellian calendars: among the Roman proper names, which in like manner contain no allusion to any gods, Marcus, Mamercus, and Mamurius appear in prevailing use from very early times; with Mars and his sacred woodpecker was connected the oldest Italian prophecy; the wolf, the animal sacred to Mars, was the badge of the Roman

Page 149

burgesses, and such sacred national legends as the Roman imagination was able to produce referred exclusively to the god Mars and to his duplicate Quirinus. In the list of festivals certainly Father Diovis—a purer and more civil than military reflection of the character of the Roman community—occupies a larger space than Mars, just as the priest of Jupiter has precedence over the two priests of the god of war; but the latter still plays a very prominent part in the list, and it is even quite likely that, when this arrangement of festivals was established, Jovis stood by the side of Mars like Ahuramazda by the side of Mithra, and that the worship of the warlike Roman community still really centred at this time in the martial god of death and his March festival, while it was not the “care-destroyer” afterwards introduced by the Greeks, but Father Jovis himself, who was regarded as the god of the heart-gladdening wine.

Nature of the Roman Gods

It is no part of our present task to consider the Roman deities in detail; but it is important, even in an historical point of view, to call attention to the peculiar character at once of shallowness and of fervour that marked the Roman faith. Abstraction and personification lay at the root of the Roman as well as of the Hellenic mythology: the Hellenic as well as the Roman god was originally suggested by some natural phenomenon or some mental conception, and to the Roman just as to the Greek every divinity appeared a person. This is evident from their apprehending the individual gods as male or female; from their style of appeal to an unknown deity,—“Be thou god or goddess, man or woman;” and from the deeply cherished belief that the name of the proper tutelary spirit of the community ought to remain for ever unpronounced, lest an enemy should come to learn it and calling the god by his name should entice him beyond the bounds. A remnant of this strongly sensuous mode of apprehension clung to Mars in particular, the oldest and most national form of divinity in Italy. But while abstraction, which lies at the foundation of every religion, elsewhere endeavoured to rise to wider and more enlarged conceptions and to penetrate ever more deeply into the essence of things, the forms of the Roman faith remained at, or sank to, a singularly low level of conception and of insight. While in the case of the Greek every influential motive speedily expanded into a group of forms and gathered around it a circle of legends and ideas, in the case of the Roman the fundamental thought remained stationary in its original naked rigidity. The religion of Rome had nothing of its own presenting even a remote resemblance to the religion of Apollo investing earthly morality with a halo of glory, to the divine intoxication of Dionysus, or to the Chthonian and mystical worships with their profound and hidden meanings. It had indeed its “bad god” (-Ve-diovis-), its

Page 150

apparitions and ghosts (-lemures-), and afterwards its deities of foul air, of fever, of diseases, perhaps even of theft (-laverna-); but it was unable to excite that mysterious awe after which the human heart has always a longing, or thoroughly to embody the incomprehensible and even the malignant elements in nature and in man, which must not be wanting in religion if it would reflect man as a whole. In the religion of Rome there was hardly anything secret except possibly the names of the gods of the city, the Penates; the real character, moreover, even of these gods was manifest to every one.

The national Roman theology sought on all hands to form distinct conceptions of important phenomena and qualities, to express them in its terminology, and to classify them systematically—in the first instance, according to that division of persons and things which also formed the basis of private law—that it might thus be able in due fashion to invoke the gods individually or by classes, and to point out (-indigitare-) to the multitude the modes of appropriate invocation. Of such notions, the products of outward abstraction—of the homeliest simplicity, sometimes venerable, sometimes ridiculous—Roman theology was in substance made up. Conceptions such as sowing (-saeturnus-) and field-labour (-ops-) ground (-tellus-) and boundary-stone (-terminus-), were among the oldest and most sacred of Roman divinities. Perhaps the most peculiar of all the forms of deity in Rome, and probably the only one for whose worship there was devised an effigy peculiarly Italian, was the double-headed Ianus; and yet it was simply suggestive of the idea so characteristic of the scrupulous spirit of Roman religion, that at the commencement of every act the “spirit of opening” should first be invoked, while it above all betokened the deep conviction that it was as indispensable to combine the Roman gods in sets as it was necessary that the more personal gods of the Hellenes should stand singly and apart.(4) Of all the worships of Rome that which perhaps had the deepest hold was the worship of the tutelary spirits that presided in and over the household and the storechamber: these were in public worship Vesta and the Penates, in family worship the gods of forest and field, the Silvani, and above all the gods of the household in its strict sense, the Lares or Lares, to whom their share of the family meal was regularly assigned, and before whom it was, even in the time of Cato the Elder, the first duty of the father of the household on returning home to perform his devotions. In the ranking of the gods, however, these spirits of the house and of the field occupied the lowest rather than the highest place; it was—and it could not be otherwise with a religion which renounced all attempts to idealize—not the broadest and most general, but the simplest and most individual abstraction, in which the pious heart found most nourishment.

Page 151

This indifference to ideal elements in the Roman religion was accompanied by a practical and utilitarian tendency, as is clearly enough apparent in the table of festivals which has been already explained. Increase of substance and of prosperity by husbandry and the rearing of flocks and herds, by seafaring and commerce—this was what the Roman desired from his gods; and it very well accords with this view, that the god of good faith (-deus fidius-), the goddess of chance and good luck (-fors fortuna-), and the god of traffic (-mercurius-), all originating out of their daily dealings, although not occurring in that ancient table of festivals, appear very early as adored far and near by the Romans. Strict frugality and mercantile speculation were rooted in the Roman character too deeply not to find their thorough reflection in its divine counterpart.

Spirits

Respecting the world of spirits little can be said. The departed souls of mortal men, the “good” (-manes-) continued to exist as shades haunting the spot where the body reposed (-dii inferi-), and received meat and drink from the survivors. But they dwelt in the depths beneath, and there was no bridge that led from the lower world either to men ruling on earth or upward to the gods above. The hero-worship of the Greeks was wholly foreign to the Romans, and the late origin and poor invention of the legend as to the foundation of Rome are shown by the thoroughly unRoman transformation of king Romulus into the god Quirinus. Numa, the oldest and most venerable name in Roman tradition, never received the honours of a god in Rome as Theseus did in Athens.

Priests

The most ancient priesthoods in the community bore reference to Mars; especially the priest of the god of the community, nominated for life, “the kindler of Mars” (-flamen Martialis-) as he was designated from presenting burnt-offerings, and the twelve “leapers” (-salii-), a band of young men who in March performed the war-dance in honour of Mars and accompanied it by song. We have already explained(5) how the amalgamation of the Hill-community with that of the Palatine gave rise to the duplication of the Roman Mars, and thereby to the introduction of a second priest of Mars—the -flamen Quirinalis- —and a second guild of dancers—the -salii collini-.

To these were added other public worships (some of which probably had an origin far earlier than that of Rome), for which either single priests were appointed—as those of Carmentis, of Vulcanus, of the god of the harbour and the river—or the celebration of which was committed to particular colleges or clans in name of the people. Such a college was probably that of the twelve “field-brethren” (-fratres arvaes-) who invoked the “creative goddess” (-dea dia-) in May to bless the growth of the seed; although it is very doubtful whether they already

Page 152

at this period enjoyed that peculiar consideration which we find subsequently accorded to them in the time of the empire. These were accompanied by the Titian brotherhood, which had to preserve and to attend to the distinctive -cultus- of the Roman Sabines,(6) and by the thirty “curial kindlers” (-flamines curiales-), instituted for the hearth of the thirty curies. The “wolf festival” (-lupercalia-) already mentioned was celebrated for the protection of the flocks and herds in honour of the “favourable god” (-faunus-) by the Quinctian clan and the Fabii who were associated with them after the admission of the Hill-Romans, in the month of February—a genuine shepherds’ carnival, in which the “Wolves” (-luperci-) jumped about naked with a girdle of goatskin, and whipped with thongs those whom they met. In like manner the community may be conceived as represented and participating in the case of other gentile worships.

To this earliest worship of the Roman community new rites were gradually added. The most important of these worships had reference to the city as newly united and virtually founded afresh by the construction of the great wall and stronghold. In it the highest and best lovis of the Capitol—that is, the genius of the Roman people—was placed at the head of all the Roman divinities, and his “kindler” thenceforth appointed, the -flamen Dialis-, formed in conjunction with the two priests of Mars the sacred triad of high-priests. Contemporaneously began the -cultus- of the new single city-hearth—Vesta—and the kindred -cultus- of the Penates of the community.(7) Six chaste virgins, daughters as it were of the household of the Roman people, attended to that pious service, and had to maintain the wholesome fire of the common hearth always blazing as an example(8) and an omen to the burgesses. This worship, half-domestic, half-public, was the most sacred of all in Rome, and it accordingly was the latest of all the heathen worships there to give way before the ban of Christianity. The Aventine, moreover, was assigned to Diana as the representative of the Latin confederacy,(9) but for that very reason no special Roman priesthood was appointed for her; and the community gradually became accustomed to render definite homage to numerous other deified abstractions by means of general festivals or by representative priesthoods specially destined for their service; in particular instances—such as those of the goddess of flowers (-Flora-) and of fruits (-Pomona-)—it appointed also special -flamines-, so that the number of these was at length fifteen. But among them they carefully distinguished those three “great kindlers” (-flamines maiores-), who down to the latest times could only be taken from the ranks of the old burgesses, just as the old incorporations of the Palatine and Quirinal -Salii-always asserted precedence over all the other colleges of priests. Thus the necessary and stated observances due to the gods of the community were entrusted once for all by the state to fixed colleges or regular ministers; and the expense of sacrifices, which was presumably not inconsiderable, was covered partly by the assignation of certain lands to particular temples, partly by the fines.(10)

Page 153

It cannot be doubted that the public worship of the other Latin, and presumably also of the Sabellian, communities was essentially similar in character. At any rate it can be shown that the Flamines, Salii, Luperci, and Vestales were institutions not special to Rome, but general among the Latins, and at least the first three colleges appear to have been formed in the kindred communities independently of the Roman model.

Lastly, as the state made arrangements for the cycle of its gods, so each burgess might make similar arrangements within his individual sphere, and might not only present sacrifices, but might also consecrate set places and ministers, to his own divinities.

Colleges of Sacred Lore

There was thus enough of priesthood and of priests in Rome. Those, however, who had business with a god resorted to the god, and not to the priest. Every suppliant and inquirer addressed himself directly to the divinity—the community of course by the king as its mouthpiece, just as the -curia- by the -curio- and the -equites-by their colonels; no intervention of a priest was allowed to conceal or to obscure this original and simple relation. But it was no easy matter to hold converse with a god. The god had his own way of speaking, which was intelligible only to the man acquainted with it; but one who did rightly understand it knew not only how to ascertain, but also how to manage, the will of the god, and even in case of need to overreach or to constrain him. It was natural, therefore, that the worshipper of the god should regularly consult such men of skill and listen to their advice; and thence arose the corporations or colleges of men specially skilled in religious lore, a thoroughly national Italian institution, which had a far more important influence on political development than the individual priests and priesthoods. These colleges have been often, but erroneously, confounded with the priesthoods. The priesthoods were charged with the worship of a specific divinity; the skilled colleges, on the other hand, were charged with the preservation of traditional rules regarding those more general religious observances, the proper fulfilment of which implied a certain amount of knowledge and rendered it necessary that the state in its own interest should provide for the faithful transmission of that knowledge. These close corporations supplying their own vacancies, of course from the ranks of the burgesses, became in this way the depositaries of skilled arts and sciences.

Augurs—Pontifices

Under the Roman constitution and that of the Latin communities in general there were originally but two such colleges; that of the augurs and that of the Pontifices.(11)

Page 154

The six “bird-carriers” (-augures-) were skilled in interpreting the language of the gods from the flight of birds; an art which was prosecuted with great earnestness and reduced to a quasi-scientific system. The six “bridge-builders” (-Pontifices-) derived their name from their function, as sacred as it was politically important, of conducting the building and demolition of the bridge over the Tiber. They were the Roman engineers, who understood the mystery of measures and numbers; whence there devolved upon them also the duty of managing the calendar of the state, of proclaiming to the people the time of new and full moon and the days of festivals, and of seeing that every religious and every judicial act took place on the right day. As they had thus an especial supervision of all religious observances, it was to them in case of need—on occasion of marriage, testament, and -adrogatio- —that the preliminary question was addressed, whether the business proposed did not in any respect offend against divine law; and it was they who fixed and promulgated the general exoteric precepts of ritual, which were known under the name of the “royal laws.” Thus they acquired (although not probably to the full extent till after the abolition of the monarchy) the general oversight of Roman worship and of whatever was connected with it—and what was there that was not so connected? They themselves described the sum of their knowledge as “the science of things divine and human.” In fact the rudiments of spiritual and temporal jurisprudence as well as of historical recording proceeded from this college. For all writing of history was associated with the calendar and the book of annals; and, as from the organization of the Roman courts of law no tradition could originate in these courts themselves, it was necessary that the knowledge of legal principles and procedure should be traditionally preserved in the college of the Pontifices, which alone was competent to give an opinion respecting court-days and questions of religious law.

Fetiales

By the side of these two oldest and most eminent corporations of men versed in spiritual lore may be to some extent ranked the college of the twenty state-heralds (-fetiales-, of uncertain derivation), destined as a living repository to preserve traditionally the remembrance of the treaties concluded with neighbouring communities, to pronounce an authoritative opinion on alleged infractions of treaty-rights, and in case of need to attempt reconciliation or declare war. They had precisely the same position with reference to international, as the Pontifices had with reference to religious, law; and were therefore, like the latter, entitled to point out the law, although not to administer it.

Page 155

But in however high repute these colleges were, and important and comprehensive as were the functions assigned to them, it was never forgotten—least of all in the case of those which held the highest position—that their duty was not to command, but to tender skilled advice, not directly to obtain the answer of the gods, but to explain the answer when obtained to the inquirer. Thus the highest of the priests was not merely inferior in rank to the king, but might not even give advice to him unasked. It was the province of the king to determine whether and when he would take an observation of birds; the “bird-seer” simply stood beside him and interpreted to him, when necessary, the language of the messengers of heaven. In like manner the Fetialis and the Pontifex could not interfere in matters of international or common law except when those concerned therewith desired it. The Romans, notwithstanding all their zeal for religion, adhered with unbending strictness to the principle that the priest ought to remain completely powerless in the state and—excluded from all command—ought like any other burgess to render obedience to the humblest magistrate.

Character of the -Cultus-

The Latin worship was grounded essentially on man's enjoyment of earthly pleasures, and only in a subordinate degree on his fear of the wild forces of nature; it consisted pre-eminently therefore in expressions of joy, in lays and songs, in games and dances, and above all in banquets. In Italy, as everywhere among agricultural tribes whose ordinary food consists of vegetables, the slaughter of cattle was at once a household feast and an act of worship: a pig was the most acceptable offering to the gods, just because it was the usual roast for a feast. But all extravagance of expense as well as all excess of rejoicing was inconsistent with the solid character of the Romans. Frugality in relation to the gods was one of the most prominent traits of the primitive Latin worship; and the free play of imagination was repressed with iron severity by the moral self-discipline which the nation maintained. In consequence the Latins remained strangers to the excesses which grow out of unrestrained indulgence. At the very core of the Latin religion there lay that profound moral impulse which leads men to bring earthly guilt and earthly punishment into relation with the world of the gods, and to view the former as a crime against the gods, and the latter as its expiation. The execution of the criminal condemned to death was as much an expiatory sacrifice offered to the divinity as was the killing of an enemy in just war; the thief who by night stole the fruits of the field paid the penalty to Ceres on the gallows just as the enemy paid it to mother earth and the good spirits on the field of battle. The profound and fearful idea of substitution also meets us here: when the gods of the community were angry and nobody could be laid hold of as definitely guilty, they might be appeased

Page 156

by one who voluntarily gave himself up (-devovere se-); noxious chasms in the ground were closed, and battles half lost were converted into victories, when a brave burgess threw himself as an expiatory offering into the abyss or upon the foe. The “sacred spring” was based on a similar view; all the offspring whether of cattle or of men within a specified period were presented to the gods. If acts of this nature are to be called human sacrifices, then such sacrifices belonged to the essence of the Latin faith; but we are bound to add that, far back as our view reaches into the past, this immolation, so far as life was concerned, was limited to the guilty who had been convicted before a civil tribunal, or to the innocent who voluntarily chose to die. Human sacrifices of a different description run counter to the fundamental idea of a sacrificial act, and, wherever they occur among the Indo-Germanic stocks at least, are based on later degeneracy and barbarism. They never gained admission among the Romans; hardly in a single instance were superstition and despair induced, even in times of extreme distress, to seek an extraordinary deliverance through means so revolting. Of belief in ghosts, fear of enchantments, or dealing in mysteries, comparatively slight traces are to be found among the Romans. Oracles and prophecy never acquired the importance in Italy which they obtained in Greece, and never were able to exercise a serious control over private or public life. But on the other hand the Latin religion sank into an incredible insipidity and dulness, and early became shrivelled into an anxious and dreary round of ceremonies. The god of the Italian was, as we have already said, above all things an instrument for helping him to the attainment of very substantial earthly aims; this turn was given to the religious views of the Italian by his tendency towards the palpable and the real, and is no less distinctly apparent in the saint-worship of the modern inhabitants of Italy. The gods confronted man just as a creditor confronted his debtor; each of them had a duly acquired right to certain performances and payments; and as the number of the gods was as great as the number of the incidents in earthly life, and the neglect or wrong performance of the worship of each god revenged itself in the corresponding incident, it was a laborious and difficult task even to gain a knowledge of a man’s religious obligations, and the priests who were skilled in the law of divine things and pointed out its requirements—the -Pontifices- —could not fail to attain an extraordinary influence. The upright man fulfilled the requirements of sacred ritual with the same mercantile punctuality with which he met his earthly obligations, and at times did more than was due, if the god had done so on his part. Man even dealt in speculation with his god; a vow was in reality as in name a formal contract between the god and the man, by which the latter promised to the former for a certain service

Page 157

to be rendered a certain equivalent return; and the Roman legal principle that no contract could be concluded by deputy was not the least important of the reasons on account of which all priestly mediation remained excluded from the religious concerns of man in Latium. Nay, as the Roman merchant was entitled, without injury to his conventional rectitude, to fulfil his contract merely in the letter, so in dealing with the gods, according to the teaching of Roman theology, the copy of an object was given and received instead of the object itself. They presented to the lord of the sky heads of onions and poppies, that he might launch his lightnings at these rather than at the heads of men. In payment of the offering annually demanded by father Tiber, thirty puppets plaited of rushes were annually thrown into the stream.(12) The ideas of divine mercy and placability were in these instances inseparably mixed up with a pious cunning, which tried to delude and to pacify so formidable a master by means of a sham satisfaction. The Roman fear of the gods accordingly exercised powerful influence over the minds of the multitude; but it was by no means that sense of awe in the presence of an all-controlling nature or of an almighty God, that lies at the foundation of the views of pantheism and monotheism respectively; on the contrary, it was of a very earthly character, and scarcely different in any material respect from the trembling with which the Roman debtor approached his just, but very strict and very powerful creditor. It is plain that such a religion was fitted rather to stifle than to foster artistic and speculative views. When the Greek had clothed the simple thoughts of primitive times with human flesh and blood, the ideas of the gods so formed not only became the elements of plastic and poetic art, but acquired also that universality and elasticity which are the profoundest characteristics of human nature and for this very reason are essential to all religions that aspire to rule the world. Through such means the simple view of nature became expanded into the conception of a cosmogony, the homely moral notion became enlarged into a principle of universal humanity; and for a long period the Greek religion was enabled to embrace within it the physical and metaphysical views—the whole ideal development of the nation—and to expand in depth and breadth with the increase of its contents, until imagination and speculation rent asunder the vessel which had nursed them. But in Latium the embodiment of the conceptions of deity continued so wholly transparent that it afforded no opportunity for the training either of artist or poet, and the Latin religion always held a distant and even hostile attitude towards art. As the god was not and could not be aught else than the spiritualization of an earthly phenomenon, this same earthly counterpart naturally formed his place of abode (- templum-) and his image; walls and effigies made by the hands of men seemed only to obscure and

Page 158

to embarrass the spiritual conception. Accordingly the original Roman worship had no images of the gods or houses set apart for them; and although the god was at an early period worshipped in Latium, probably in imitation of the Greeks, by means of an image, and had a little chapel (-aedicula-) built for him, such a figurative representation was reckoned contrary to the laws of Numa and was generally regarded as an impure and foreign innovation. The Roman religion could exhibit no image of a god peculiar to it, with the exception, perhaps, of the double-headed Ianus; and Varro even in his time derided the desire of the multitude for puppets and effigies. The utter want of productive power in the Roman religion was likewise the ultimate cause of the thorough poverty which always marked Roman poetry and still more Roman speculation.

The same distinctive character was manifest, moreover, in the domain of its practical use. The practical gain which accrued to the Roman community from their religion was a code of moral law gradually developed by the priests, and the -Pontifices- in particular, which on the one hand supplied the place of police regulations at a time when the state was still far from providing any direct police-guardianship for its citizens, and on the other hand brought to the bar of the gods and visited with divine penalties the breach of moral obligations. To the regulations of the former class belonged the religious inculcation of a due observance of holidays and of a cultivation of the fields and vineyards according to the rules of good husbandry—which we shall have occasion to notice more fully in the sequel—as well as the worship of the heath or of the Lares which was connected with considerations of sanitary police,(13) and above all the practice of burning the bodies of the dead, adopted among the Romans at a singularly early period, far earlier than among the Greeks—a practice implying a rational conception of life and of death, which was foreign to primitive times and is even foreign to ourselves at the present day. It must be reckoned no small achievement that the national religion of the Latins was able to carry out these and similar improvements. But the civilizing effect of this law was still more important. If a husband sold his wife, or a father sold his married son; if a child struck his father, or a daughter-in-law her father-in-law; if a patron violated his obligation to keep faith with his guest or dependent; if an unjust neighbour displaced a boundary-stone, or the thief laid hands by night on the grain entrusted to the common good faith; the burden of the curse of the gods lay thenceforth on the head of the offender. Not that the person thus accursed (-sacer-) was outlawed; such an outlawry, inconsistent in its nature with all civil order, was only an exceptional occurrence—an aggravation of the religious curse in Rome at the time of the quarrels between the orders. It was not the province of the individual burgess, or even of

Page 159

the wholly powerless priest, to carry into effect such a divine curse. Primarily the person thus accursed became liable to the divine penal judgment, not to human caprice; and the pious popular faith, on which that curse was based, must have had power even over natures frivolous and wicked. But the banning was not confined to this; the king was in reality entitled and bound to carry the ban into execution, and, after the fact, on which the law set its curse, had been according to his conscientious conviction established, to slay the person under ban, as it were, as a victim offered up to the injured deity (-supplicium-), and thus to purify the community from the crime of the individual. If the crime was of a minor nature, for the slaying of the guilty there was substituted a ransom through the presenting of a sacrificial victim or of similar gifts. Thus the whole criminal law rested as to its ultimate basis on the religious idea of expiation.

But religion performed no higher service in Latium than the furtherance of civil order and morality by such means as these. In this field Hellas had an unspeakable advantage over Latium; it owed to its religion not merely its whole intellectual development, but also its national union, so far as such an union was attained at all; the oracles and festivals of the gods, Delphi and Olympia, and the Muses, daughters of faith, were the centres round which revolved all that was great in Hellenic life and all in it that was the common heritage of the nation. And yet even here Latium had, as compared with Hellas, its own advantages. The Latin religion, reduced as it was to the level of ordinary perception, was completely intelligible to every one and accessible in common to all; and therefore the Roman community preserved the equality of its citizens, while Hellas, where religion rose to the level of the highest thought, had from the earliest times to endure all the blessing and curse of an aristocracy of intellect. The Latin religion like every other had its origin in the effort of faith to fathom the infinite; it is only to a superficial view, which is deceived as to the depth of the stream because it is clear, that its transparent spirit-world can appear to be shallow. This fervid faith disappeared with the progress of time as necessarily as the dew of morning disappears before the rising sun, and thus the Latin religion came subsequently to wither; but the Latins preserved their simplicity of belief longer than most peoples and longer especially than the Greeks. As colours are effects of light and at the same time dim it, so art and science are not merely the creations but also the destroyers of faith; and, much as this process at once of development and of destruction is swayed by necessity, by the same law of nature certain results have been reserved to the epoch of early simplicity—results which subsequent epochs make vain endeavours to attain. The mighty intellectual development of the Hellenes,

Page 160

which created their religious and literary unity (ever imperfect as that unity was), was the very thing that made it impossible for them to attain to a genuine political union; they sacrificed thereby the simplicity, the flexibility, the self-devotion, the power of amalgamation, which constitute the conditions of any such union. It is time therefore to desist from that childish view of history which believes that it can commend the Greeks only at the expense of the Romans, or the Romans only at the expense of the Greeks; and, as we allow the oak to hold its own beside the rose, so should we abstain from praising or censuring the two noblest organizations which antiquity has produced, and comprehend the truth that their distinctive excellences have a necessary connection with their respective defects. The deepest and ultimate reason of the diversity between the two nations lay beyond doubt in the fact that Latium did not, and that Hellas did, during the season of growth come into contact with the East. No people on earth was great enough by its own efforts to create either the marvel of Hellenic or at a later period the marvel of Christian culture; history has produced these most brilliant results only where the ideas of Aramaic religion have sunk into an Indo-Germanic soil. But if for this reason Hellas is the prototype of purely human, Latium is not less for all time the prototype of national development; and it is the duty of us their successors to honour both and to learn from both.

Foreign Worship

Such was the nature and such the influence of the Roman religion in its pure, unhampered, and thoroughly national development. Its national character was not infringed by the fact that, from the earliest times, modes and systems of worship were introduced from abroad; no more than the bestowal of the rights of citizenship on individual foreigners denationalized the Roman state. An exchange of gods as well as of goods with the Latins in older time must have been a matter of course; the transplantation to Rome of gods and worships belonging to less cognate races is more remarkable. Of the distinctive Sabine worship maintained by the Titians we have already spoken.⁽¹⁴⁾ Whether any conceptions of the gods were borrowed from Etruria is more doubtful: for the Lases, the older designation of the genii (from -lascivus-), and Minerva the goddess of memory (-mens-, -menervare-), which it is customary to describe as originally Etruscan, were on the contrary, judging from philological grounds, indigenous to Latium. It is at any rate certain, and in keeping with all that we otherwise know of Roman intercourse that the Greek worship received earlier and more extensive attention in Rome than any other of foreign origin. The Greek oracles furnished the earliest occasion of its introduction. The language of the Roman gods was on the whole confined to Yea and Nay or at the most to the making their

Page 161

will known by the method of casting lots, which appears in its origin Italian;(15) while from very ancient times—although not apparently until the impulse was received from the East—the more talkative gods of the Greeks imparted actual utterances of prophecy. The Romans made efforts, even at an early period, to treasure up such counsels, and copies of the leaves of the soothsaying priestess of Apollo, the Cumaean Sibyl, were accordingly a highly valued gift on the part of their Greek guest-friends from Campania. For the reading and interpretation of the fortune-telling book a special college, inferior in rank only to the augurs and Pontifices, was instituted in early times, consisting of two men of lore (-duoviri sacris faciundis-), who were furnished at the expense of the state with two slaves acquainted with the Greek language. To these custodiers of oracles the people resorted in cases of doubt, when an act of worship was needed in order to avoid some impending evil and they did not know to which of the gods or with what rites it was to be performed. But Romans in search of advice early betook themselves also to the Delphic Apollo himself. Besides the legends relating to such an intercourse already mentioned,(16) it is attested partly by the reception of the word -thesaurus- so closely connected with the Delphic oracle into all the Italian languages with which we are acquainted, and partly by the oldest Roman form of the name of Apollo, -Aperta-, the “opener,” an etymologizing alteration of the Doric Apellon, the antiquity of which is betrayed by its very barbarism. The Greek Herakles was naturalized in Italy as Herclus, Hercoles, Hercules, at an early period and under a peculiar conception of his character, apparently in the first instance as the god of gains of adventure and of any extraordinary increase of wealth; for which reason the general was wont to present the tenth of the spoil which he had procured, and the merchant the tenth of the substance which he had obtained, to Hercules at the chief altar (-ara maxima-) in the cattle-market. Accordingly he became the god of mercantile covenants generally, which in early times were frequently concluded at this altar and confirmed by oath, and in so far was identified with the old Latin god of good faith (-deus fidius-). The worship of Hercules was from an early date among the most widely diffused; he was, to use the words of an ancient author, adored in every hamlet of Italy, and altars were everywhere erected to him in the streets of the cities and along the country roads. The gods also of the mariner, Castor and Polydeukes or, in Roman form, Pollux, the god of traffic Hermes—the Roman Mercurius—and the god of healing, Asklapios or Aesculapius, became early known to the Romans, although their public worship only began at a later period. The name of the festival of the “good goddess” (-bona dea-) -damium-, corresponding to the Greek —damion— or —deimion—, may likewise reach

Page 162

back as far as this epoch. It must be the result also of ancient borrowing, that the old -Liber pater- of the Romans was afterwards conceived as “father deliverer” and identified with the wine-god of the Greeks, the “releaser” (-Lyaeos-), and that the Roman god of the lower regions was called the “dispenser of riches” (-Pluto- — -Dis pater-), while his spouse Persephone became converted at once by change of the initial sound and by transference of the idea into the Roman Proserpina, that is, “germinatrix.” Even the goddess of the Romano-Latin league, Diana of the Aventine, seems to have been copied from the federal goddess of the Ionians of Asia Minor, the Ephesian Artemis; at least her carved image in the Roman temple was formed after the Ephesian type.(17) It was in this way alone, through the myths of Apollo, Dionysus, Pluto, Herakles, and Artemis, which were early pervaded by Oriental ideas, that the Aramaic religion exercised at this period a remote and indirect influence on Italy. We clearly perceive from these facts that the introduction of the Greek religion was especially due to commercial intercourse, and that it was traders and mariners who primarily brought the Greek gods to Italy.

These individual cases however of derivation from abroad were but of secondary moment, while the remains of the natural symbolism of primeval times, of which the legend of the oxen of Cacus may perhaps be a specimen,(18) had virtually disappeared. In all its leading features the Roman religion was an organic creation of the people among whom we find it.

Religion of the Sabellians

The Sabellian and Umbrian worship, judging from the little we know of it, rested upon quite the same fundamental views as the Latin with local variations of colour and form. That it was different from the Latin is very distinctly apparent from the founding of a special college at Rome for the preservation of the Sabine rites;(19) but that very fact affords an instructive illustration of the nature of the difference. Observation of the flight of birds was with both stocks the regular mode of consulting the gods; but the Tities observed different birds from the Ramnian augurs. Similar relations present themselves, wherever we have opportunity of comparing them. Both stocks in common regarded the gods as abstractions of the earthly and as of an impersonal nature; they differed in expression and ritual. It was natural that these diversities should appear of importance to the worshippers of those days; we are no longer able to apprehend what was the characteristic distinction, if any really existed.

Religion of the Etruscans

Page 163

But the remains of the sacred ritual of the Etruscans that have reached us are marked by a different spirit. Their prevailing characteristics are a gloomy and withal tiresome mysticism, ringing the changes on numbers, soothsaying, and that solemn enthroning of pure absurdity which at all times finds its own circle of devotees. We are far from knowing the Etruscan worship in such completeness and purity as we know the Latin; and it is not improbable—indeed it cannot well be doubted—that several of its features were only imported into it by the minute subtlety of a later period, and that the gloomy and fantastic principles, which were most alien to the Latin worship, are those that have been especially handed down to us by tradition. But enough still remains to show that the mysticism and barbarism of this worship had their foundation in the essential character of the Etruscan people.

With our very unsatisfactory knowledge we cannot grasp the intrinsic contrast subsisting between the Etruscan conceptions of deity and the Italian; but it is clear that the most prominent among the Etruscan gods were the malignant and the mischievous; as indeed their worship was cruel, and included in particular the sacrifice of their captives; thus at Caere they slaughtered the Phocaeans, and at Traquinii the Roman prisoners. Instead of a tranquil world of departed “good spirits” ruling peacefully in the realms beneath, such as the Latins had conceived, the Etruscan religion presented a veritable hell, in which the poor souls were doomed to be tortured by mallets and serpents, and to which they were conveyed by the conductor of the dead, a savage semi-brutal figure of an old man with wings and a large hammer—a figure which afterwards served in the gladiatorial games at Rome as a model for the costume of the man who removed the corpses of the slain from the arena. So fixed was the association of torture with this condition of the shades, that there was even provided a redemption from it, which after certain mysterious offerings transferred the poor soul to the society of the gods above. It is remarkable that, in order to people their lower world, the Etruscans early borrowed from the Greeks their gloomiest notions, such as the doctrine of Acheron and Charon, which play an important part in the Etruscan discipline.

But the Etruscan occupied himself above all in the interpretation of signs and portents. The Romans heard the voice of the gods in nature; but their bird-seer understood only the signs in their simplicity, and knew only in general whether the occurrence boded good or ill. Disturbances of the ordinary course of nature were regarded by him as boding evil, and put a stop to the business in hand, as when for example a storm of thunder and lightning dispersed the comitia; and he probably sought to get rid of them, as, for example, in the case of monstrous births, which were put to death as speedily as possible. But beyond

Page 164

the Tiber matters were carried much further. The profound Etruscan read off to the believer his future fortunes in detail from the lightning and from the entrails of animals offered in sacrifice; and the more singular the language of the gods, the more startling the portent or prodigy, the more confidently did he declare what they foretold and the means by which it was possible to avert the mischief. Thus arose the lore of lightning, the art of inspecting entrails, the interpretation of prodigies—all of them, and the science of lightning especially, devised with the hair-splitting subtlety which characterizes the mind in pursuit of absurdities. A dwarf called Tages with the figure of a child but with gray hairs, who had been ploughed up by a peasant in a field near Tarquinii—we might almost fancy that practices at once so childish and so drivelling had sought to present in this figure a caricature of themselves—betrayed the secret of this lore to the Etruscans, and then straightway died. His disciples and successors taught what gods were in the habit of hurling the lightning; how the lightning of each god might be recognized by its colour and the quarter of the heavens whence it came; whether the lightning boded a permanent state of things or a single event; and in the latter case whether the event was one unalterably fixed, or whether it could be up to a certain limit artificially postponed: how they might convey the lightning away when it struck, or compel the threatening lightning to strike, and various marvellous arts of the like kind, with which there was incidentally conjoined no small desire of pocketing fees. How deeply repugnant this jugglery was to the Roman character is shown by the fact that, even when people came at a later period to employ the Etruscan lore in Rome, no attempt was made to naturalize it; during our present period the Romans were probably still content with their own, and with the Greek oracles.

The Etruscan religion occupied a higher level than the Roman, in so far as it developed at least the rudiments of what was wholly wanting among the Romans—a speculation veiled under religious forms. Over the world and its gods there ruled the veiled gods (-Dii involuti-), consulted by the Etruscan Jupiter himself; that world moreover was finite, and, as it had come into being, so was it again to pass away after the expiry of a definite period of time, whose sections were the -saecula-. Respecting the intellectual value which may once have belonged to this Etruscan cosmogony and philosophy, it is difficult to form a judgment; they appear however to have been from the very first characterized by a dull fatalism and an insipid play upon number.

Notes for Book I Chapter XII

1. I. II. Religion

2. This was, to all appearance, the original nature of the “morning-mother” or -Mater matuta-; in connection with which we may recall the circumstance that, as the names Lucius and especially -Manius- show, the morning hour was reckoned as lucky for birth.

-Mater matuta-probably became a goddess of sea and harbour only at a later epoch under the influence of the myth of Leucothea; the fact that the goddess was chiefly worshipped by women tells against the view that she was originally a harbour-goddess.

Page 165

3. From -Mauris-, which is the oldest form handed down by tradition, there have been developed by different treatment of the -u -Mars-, -Mavors-, -Mors-; the transition to -o (similar to -Paula-, -Pola-, and the like) appears also in the double form Mar-Mor (comp. -Ma-murius-) alongside of -Mar-Mor- and -Ma-Mers-.

4. The facts, that gates and doors and the morning (-ianus matutinus-) were sacred to Ianus, and that he was always invoked before any other god and was even represented in the series of coins before Jupiter and the other gods, indicate unmistakably that he was the abstraction of opening and beginning. The double-head looking both ways was connected with the gate that opened both ways. To make him god of the sun and of the year is the less justifiable, because the month that bears his name was originally the eleventh, not the first; that month seems rather to have derived its name from the circumstance, that at this season after the rest of the middle of winter the cycle of the labours of the field began afresh. It was, however, a matter of course that the opening of the year should also be included in the sphere of Ianus, especially after Ianuarius came to be placed at its head.

8. I. III. Latium

9. I. VII. Relation of Rome to Latium

10. I. V. Burdens of the Burgesses, I. XI. Crimes

11. The clearest evidence of this is the fact, that in the communities organized on the Latin scheme augurs and Pontifices occur everywhere (e. g. Cic. de Lege Agr. ii. 35, 96, and numerous inscriptions), as does likewise the -pater patratus- of the Fetiales in Laurentum (Orelli, 2276), but the other colleges do not. The former, therefore, stand on the same footing with the constitution of ten curies and the Flamines, Salii, and Luperci, as very ancient heirlooms of the Latin stock; whereas the Duoviri -sacris faciundis-, and the other colleges, like the thirty curies and the Servian tribes and centuries, originated in, and remained therefore confined to, Rome. But in the case of the second college—the pontifices—the influence of Rome probably led to the introduction of that name into the general Latin scheme instead of some earlier—perhaps more than one—designation; or—a hypothesis which philologically has much in its favour— -pons- originally signified not “bridge,” but “way” generally, and -pontifex- therefore meant “constructor of ways.”

The statements regarding the original number of the augurs in particular vary. The view that it was necessary for the number to be an odd one is refuted by Cicero (*de Lege Agr.* ii. 35, 96); and Livy (x. 6) does not say so, but only states that the number of Roman augurs had to be divisible by three, and so must have had an odd number as its basis. According to Livy (l. c.) the number was six down to the Ogulnian law, and the same is virtually affirmed by Cicero (*de Rep.* ii. 9, 14) when he represents Romulus as instituting four, and Numa two, augural stalls. On the number of the pontifices comp. *Staatsrecht*, ii. 20.

Page 166

12. It is only an unreflecting misconception that can discover in this usage a reminiscence of ancient human sacrifices.

CHAPTER XIII

Agriculture, Trade, and Commerce

Agriculture and commerce are so intimately bound up with the constitution and the external history of states, that the former must frequently be noticed in the course of describing the latter. We shall here endeavour to supplement the detached notices which we have already given, by exhibiting a summary view of Italian and particularly of Roman economics.

Agriculture

It has been already observed⁽¹⁾ that the transition from a pastoral to an agricultural economy preceded the immigration of the Italians into the peninsula. Agriculture continued to be the main support of all the communities in Italy, of the Sabellians and Etruscans no less than of the Latins. There were no purely pastoral tribes in Italy during historical times, although of course the various races everywhere combined pastoral husbandry, to a greater or less extent according to the nature of the locality, with the cultivation of the soil. The beautiful custom of commencing the formation of new cities by tracing a furrow with the plough along the line of the future ring-wall shows how deeply rooted was the feeling that every commonwealth is dependent on agriculture. In the case of Rome in particular—and it is only in its case that we can speak of agrarian relations with any sort of certainty—the Servian reform shows very clearly not only that the agricultural class originally preponderated in the state, but also that an effort was

made permanently to maintain the collective body of freeholders as the pith and marrow of the community. When in the course of time a large portion of the landed property in Rome had passed into the hands of non-burgesses and thus the rights and duties of burgesses were no longer bound up with freehold property, the reformed constitution obviated this incongruous state of things, and the perils which it threatened, not merely temporarily but permanently, by treating the members of the community without reference to their political position once for all according to their freeholding, and imposing the common burden of war-service on the freeholders—a step which in the natural course of things could not but be followed by the concession of public rights.

Page 167

The whole policy of Roman war and conquest rested, like the constitution itself, on the basis of the freehold system; as the freeholder alone was of value in the state, the aim of war was to increase the number of its freehold members. The vanquished community was either compelled to merge entirely into the yeomanry of Rome, or, if not reduced to this extremity, it was required, not to pay a war-contribution or a fixed tribute, but to cede a portion, usually a third part, of its domain, which was thereupon regularly occupied by Roman farms. Many nations have gained victories and made conquests as the Romans did; but none has equalled the Roman in thus making the ground he had won his own by the sweat of his brow, and in securing by the ploughshare what had been gained by the lance. That which is gained by war may be wrested from the grasp by war again, but it is not so with the conquests made by the plough; while the Romans lost many battles, they scarcely ever on making peace ceded Roman soil, and for this result they were indebted to the tenacity with which the farmers clung to their fields and homesteads. The strength of man and of the state lies in their dominion over the soil; the greatness of Rome was built on the most extensive and immediate mastery of her citizens over her soil, and on the compact unity of the body which thus acquired so firm a hold.

System of Joint Cultivation

We have already indicated⁽²⁾ that in the earliest times the arable land was cultivated in common, probably by the several clans; each clan tilled its own land, and thereafter distributed the produce among the several households belonging to it. There exists indeed an intimate connection between the system of joint tillage and the clan form of society, and even subsequently in Rome joint residence and joint management were of very frequent occurrence in the case of co-proprietors.⁽³⁾ Even the traditions of Roman law furnish the information that wealth consisted at first in cattle and the usufruct of the soil, and that it was not till later that land came to be distributed among the burgesses as their own special property.⁽⁴⁾ Better evidence that such was the case is afforded by the earliest designation of wealth as “cattle-stock” or “slave-and-cattle-stock” (-pecunia-, -familia pecuniaque-), and of the separate possessions of the children of the household and of slaves as “small cattle” (-peculium-) also by the earliest form of acquiring property through laying hold of it with the hand (-mancipatio-), which was only appropriate to the case of moveable articles;⁽⁵⁾ and above all by the earliest measure of “land of one’s own” (-heredium-, from -herus-lord), consisting of two -jugera-(about an acre and a quarter), which can only have applied to garden-ground, and not to the hide.⁽⁶⁾ When and how the distribution of the arable land took place, can no longer be ascertained. This much only is certain, that the oldest form of

Page 168

the constitution was based not on freehold settlement, but on clanship as a substitute for it, whereas the Servian constitution presupposes the distribution of the land. It is evident from the same constitution that the great bulk of the landed property consisted of middle-sized farms, which provided work and subsistence for a family and admitted of the keeping of cattle for tillage as well as of the application of the plough. The ordinary extent of such a Roman full hide has not been ascertained with precision, but can scarcely, as has already been shown,(7) be estimated at less than twenty -jugera-(12 1/2 acres nearly).

Culture of Grain

Their husbandry was mainly occupied with the culture of the cereals. The usual grain was spelt (-far-);(8) but different kinds of pulse, roots, and vegetables were also diligently cultivated.

Culture of the Vine

That the culture of the vine was not introduced for the first time into Italy by Greek settlers,(9) is shown by the list of the festivals of the Roman community which reaches back to a time preceding the Greeks, and which presents three wine-festivals to be celebrated in honour of "father Jovis," not in honour of the wine-god of more recent times who was borrowed from the Greeks, the "father deliverer." The very ancient legend which represents Mezentius king of Caere as levying a wine-tax from the Latins or the Rutuli, and the various versions of the widely-spread Italian story which affirms that the Celts were induced to cross the Alps in consequence of their coming to the knowledge of the noble fruits of Italy, especially of the grape and of wine, are indications of the pride of the Latins in their glorious vine, the envy of all their neighbours. A careful system of vine-husbandry was early and generally inculcated by the Latin priests. In Rome the vintage did not begin until the supreme priest of the community, the -flamen- of Jupiter, had granted permission for it and had himself made a beginning; in like manner a Tusculan ordinance forbade the sale of new wine, until the priest had proclaimed the festival of opening the casks. The early prevalence of the culture of the vine is likewise attested not only by the general adoption of wine-libations in the sacrificial ritual, but also by the precept of the Roman priests promulgated as a law of king Numa, that men should present in libation to the gods no wine obtained from uncut grapes; just as, to introduce the beneficial practice of drying the grain, they prohibited the offering of grain undried.

Culture of the Olive

The culture of the olive was of later introduction, and certainly was first brought to Italy by the Greeks.(10) The olive is said to have been first planted on the shores of the western Mediterranean towards the close of the second century of the city; and this view accords with the fact that the olive-branch and the olive occupy in the Roman ritual a place very subordinate to the juice of the vine. The esteem in which both noble trees were held by the Romans is shown by the vine and the olive-tree which were planted in the middle of the Forum, not far from the Curtian lake.

Page 169

The Fig

The principal fruit-tree planted was the nutritious fig, which was probably a native of Italy. The legend of the origin of Rome wove its threads most closely around the old fig-trees, several of which stood near to and in the Roman Forum.(11)

Management of the Farm

It was the farmer and his sons who guided the plough, and performed generally the labours of husbandry: it is not probable that slaves or free day-labourers were regularly employed in the work of the ordinary farm. The plough was drawn by the ox or by the cow; horses, asses, and mules served as beasts of burden. The rearing of cattle for the sake of meat or of milk did not exist at all as a distinct branch of husbandry, or was prosecuted only to a very limited extent, at least on the land which remained the property of the clan; but, in addition to the smaller cattle which were driven out together to the common pasture, swine and poultry, particularly geese, were kept at the farm-yard. As a general rule, there was no end of ploughing and re-ploughing: a field was reckoned imperfectly tilled, in which the furrows were not drawn so close that harrowing could be dispensed with; but the management was more earnest than intelligent, and no improvement took place in the defective plough or in the imperfect processes of reaping and of threshing. This result is probably attributable rather to the scanty development of rational mechanics than to the obstinate clinging of the farmers to use and wont; for mere kindly attachment to the system of tillage transmitted with the patrimonial soil was far from influencing the practical Italian, and obvious improvements in agriculture, such as the cultivation of fodder-plants and the irrigation of meadows, may have been early adopted from neighbouring peoples or independently developed—Roman literature itself in fact began with the discussion of the theory of agriculture. Welcome rest followed diligent and judicious labour; and here too religion asserted her right to soothe the toils of life even to the humble by pauses for recreation and for freer human movement and intercourse. Every eighth day (-nonae-), and therefore on an average four times a month, the farmer went to town to buy and sell and transact his other business. But rest from labour, in the strict sense, took place only on the several festival days, and especially in the holiday-month after the completion of the winter sowing (-feriae sementivae-): during these set times the plough rested by command of the gods, and not the farmer only, but also his slave and his ox, reposed in holiday idleness.

Page 170

Such, probably, was the way in which the ordinary Roman farm was cultivated in the earliest times. The next heirs had no protection against bad management except the right of having the spendthrift who squandered his inherited estate placed under wardship as if he were a lunatic.⁽¹²⁾ Women moreover were in substance divested of their personal right of disposal, and, if they married, a member of the same clan was ordinarily assigned as husband, in order to retain the estate within the clan. The law sought to check the overburdening of landed property with debt partly by ordaining, in the case of a debt secured over the land, the provisional transference of the ownership of the object pledged from the debtor to the creditor, partly, in the case of a simple loan, by the rigour of the proceedings in execution which speedily led to actual bankruptcy; the latter means however, as the sequel will show, attained its object but very imperfectly. No restriction was imposed by law on the free divisibility of property. Desirable as it might be that co-heirs should remain in the undivided possession of their heritage, even the oldest law was careful to keep the power of dissolving such a partnership open at any time to any partner; it was good that brethren should dwell together in peace, but to compel them to do so was foreign to the liberal spirit of Roman law. The Servian constitution moreover shows that even in the regal period of Rome there were not wanting cottagers and garden-proprietors, with whom the mattock took the place of the plough. It was left to custom and the sound sense of the population to prevent excessive subdivision of the soil; and that their confidence in this respect was not misplaced and the landed estates ordinarily remained entire, is proved by the universal Roman custom of designating them by permanent individual names. The community exercised only an indirect influence in the matter by the sending forth of colonies, which regularly led to the establishment of a number of new full hides, and frequently doubtless also to the suppression of a number of cottage holdings, the small landholders being sent forth as colonists.

Landed Proprietors

It is far more difficult to perceive how matters stood with landed property on a larger scale. The fact that such larger properties existed to no inconsiderable extent, cannot be doubted from the early development of the *-equites-*, and may be easily explained partly by the distribution of the clan-lands, which of itself could not but call into existence a class of larger landowners in consequence of the necessary inequality in the numbers of the persons belonging to the several clans and participating in the distribution, and partly by the abundant influx of mercantile capital to Rome. But farming on a large scale in the proper sense, implying a considerable establishment of slaves, such as we afterwards meet with at Rome, cannot be supposed

Page 171

to have existed during this period. On the contrary, to this period we must refer the ancient definition, which represents the senators as called fathers from the fields which they parcelled out among the common people as a father among his children; and originally the landowner must have distributed that portion of his land which he was unable to farm in person, or even his whole estate, into little parcels among his dependents to be cultivated by them, as is the general practice in Italy at the present day. The recipient might be the house-child or slave of the granter; if he was a free man, his position was that which subsequently went by the name of "occupancy on sufferance" (-precarium-). The recipient retained his occupancy during the pleasure of the granter, and had no legal means of protecting himself in possession against him; on the contrary, the granter could eject him at any time when he pleased. The relation did not necessarily involve any payment on the part of the person who had the usufruct of the soil to its proprietor; but such a payment beyond doubt frequently took place and may, as a rule, have consisted in the delivery of a portion of the produce. The relation in this case approximated to the lease of subsequent times, but remained always distinguished from it partly by the absence of a fixed term for its expiry, partly by its non-actionable character on either side and the legal protection of the claim for rent depending entirely on the lessor's right of ejection. It is plain that it was essentially a relation based on mutual fidelity, which could not subsist without the help of the powerful sanction of custom consecrated by religion; and this was not wanting. The institution of clientship, altogether of a moral-religious nature, beyond doubt rested fundamentally on this assignation of the profits of the soil. Nor was the introduction of such an assignation dependent on the abolition of the system of common tillage; for, just as after this abolition the individual, so previous to it the clan might grant to dependents a joint use of its lands; and beyond doubt with this very state of things was connected the fact that the Roman clientship was not personal, but that from the outset the client along with his clan entrusted himself for protection and fealty to the patron and his clan. This earliest form of Roman landholding serves to explain how there sprang from the great landlords in Rome a landed, and not an urban, nobility. As the pernicious institution of middlemen remained foreign to the Romans, the Roman landlord found himself not much less chained to his land than was the tenant and the farmer; he inspected and took part in everything himself, and the wealthy Roman esteemed it his highest praise to be reckoned a good landlord. His house was in the country; in the city he had only a lodging for the purpose of attending to his business there, and perhaps of breathing the purer air that prevailed there during the hot season. Above all, however,

Page 172

these arrangements furnished a moral basis for the relation between the upper class and the common people, and so materially lessened its dangers. The free tenants-on-sufferance, sprung from families of decayed farmers, dependents, and freedmen, formed the great bulk of the proletariat,(13) and were not much more dependent on the landlord than the petty leaseholder inevitably is with reference to the great proprietor. The slaves tilling the fields for a master were beyond doubt far less numerous than the free tenants. In all cases where an immigrant nation has not at once reduced to slavery a population -en masse-, slaves seem to have existed at first only to a very limited amount, and consequently free labourers seem to have played a very different part in the state from that in which they subsequently appear. In Greece "day-labourers" (—theites—) in various instances during the earlier period occupy the place of the slaves of a later age, and in some communities, among the Locrians for instance, there was no slavery down to historical times. Even the slave, moreover, was ordinarily of Italian descent; the Volscian, Sabine, or Etruscan war-captive must have stood in a different relation towards his master from the Syrian and the Celt of later times. Besides as a tenant he had in fact, though not in law, land and cattle, wife and child, as the landlord had, and after manumission was introduced(14) there was a possibility, not remote, of working out his freedom. If such then was the footing on which landholding on a large scale stood in the earliest times, it was far from being an open sore in the commonwealth; on the contrary, it was of most material service to it. Not only did it provide subsistence, although scantier upon the whole, for as many families in proportion as the intermediate and smaller properties; but the landlords moreover, occupying a comparatively elevated and free position, supplied the community with its natural leaders and rulers, while the agricultural and unpropertied tenants-on-sufferance furnished the genuine material for the Roman policy of colonization, without which it never would have succeeded; for while the state may furnish land to him who has none, it cannot impart to one who knows nothing of agriculture the spirit and the energy to wield the plough.

Pastoral Husbandry

Ground under pasture was not affected by the distribution of the land. The state, and not the clanship, was regarded as the owner of the common pastures. It made use of them in part for its own flocks and herds, which were intended for sacrifice and other purposes and were always kept up by means of the cattle-fines; and it gave to the possessors of cattle the privilege of driving them out upon the common pasture for a moderate payment (-scriptura-). The right of pasturage on the public domains may have originally borne some relation -de facto- to the possession of

Page 173

land, but no connection -de jure- can ever have subsisted in Rome between the particular hides of land and a definite proportional use of the common pasture; because property could be acquired even by the —metoikos—, but the right to use the common pasture was only granted exceptionally to the —metoikos— by the royal favour. At this period, however, the public land seems to have held but a subordinate place in the national economy generally, for the original common pasturage was not perhaps very extensive, and the conquered territory was probably for the most part distributed immediately as arable land among the clans or at a later period among individuals.

Handicrafts

While agriculture was the chief and most extensively prosecuted occupation in Rome, other branches of industry did not fail to accompany it, as might be expected from the early development of urban life in that emporium of the Latins. In fact eight guilds of craftsmen were numbered among the institutions of king Numa, that is, among the institutions that had existed in Rome from time immemorial. These were the flute-blowers, the goldsmiths, the coppersmiths, the carpenters, the fullers, the dyers, the potters, and the shoemakers—a list which would substantially exhaust the class of tradesmen working to order on account of others in the very early times, when the baking of bread and the professional art of healing were not yet known and wool was spun into clothing by the women of the household themselves. It is remarkable that there appears no special guild of workers in iron. This affords a fresh confirmation of the fact that the manufacture of iron was of comparatively late introduction in Latium; and on this account in matters of ritual down to the latest times copper alone might be used, *e.g.* for the sacred plough and the shear-knife of the priests. These bodies of craftsmen must have been of great importance in early times for the urban life of Rome and for its position towards the Latin land—an importance not to be measured by the depressed condition of Roman handicraft in later times, when it was injuriously affected by the multitude of artisan-slaves working for their master or on his account, and by the increased import of articles of luxury. The oldest lays of Rome celebrated not only the mighty war-god Mamers, but also the skilled armourer Mamurius, who understood the art of forging for his fellow-burgesses shields similar to the divine model shield that had fallen from heaven; Volcanus the god of fire and of the forge already appears in the primitive list of Roman festivals.⁽¹⁵⁾ Thus in the earliest Rome, as everywhere, the arts of forging and of wielding the ploughshare and the sword went hand in hand, and there was nothing of that arrogant contempt for handicrafts which we afterwards meet with there. After the Servian organization, however, imposed the duty of serving in the army exclusively

Page 174

on the freeholders, the industrial classes were excluded not by any law, but practically in consequence of their general want of a freehold qualification, from the privilege of bearing arms, except in the case of special subdivisions chosen from the carpenters, coppersmiths, and certain classes of musicians and attached with a military organization to the army; and this may perhaps have been the origin of the subsequent habit of depreciating the manual arts and of the position of political inferiority assigned to them. The institution of guilds doubtless had the same object as the colleges of priests that resembled them in name; the men of skill associated themselves in order more permanently and securely to preserve the tradition of their art. That there was some mode of excluding unskilled persons is probable; but no traces are to be met with either of monopolizing tendencies or of protective steps against inferior manufactures. There is no aspect, however, of the life of the Roman people respecting which our information is so scanty as that of the Roman trades.

Inland Commerce of the Italians

Italian commerce must, it is obvious, have been limited in the earliest epoch to the mutual dealings of the Italians themselves. Fairs (-mercatus-), which must be distinguished from the usual weekly markets (-nundinae-) were of great antiquity in Latium. Probably they were at first associated with international gatherings and festivals, and so perhaps were connected in Rome with the festival at the federal temple on the Aventine; the Latins, who came for this purpose to Rome every year on the 13th August, may have embraced at the same time the opportunity of transacting their business in Rome and of purchasing what they needed there. A similar and perhaps still greater importance belonged in the case of Etruria to the annual general assembly at the temple of Voltumna (perhaps near Montefiascone) in the territory of Volsinii; it served at the same time as a fair and was regularly frequented by Roman traders. But the most important of all the Italian fairs was that which was held at Soracte in the grove of Feronia, a situation than which none could be found more favourable for the exchange of commodities among the three great nations. That high isolated mountain, which appears to have been set down by nature herself in the midst of the plain of the Tiber as a goal for the traveller, lay on the boundary which separated the Etruscan and Sabine lands (to the latter of which it appears mostly to have belonged), and it was likewise easily accessible from Latium and Umbria. Roman merchants regularly made their appearance there, and the wrongs of which they complained gave rise to many a quarrel with the Sabines.

Page 175

Beyond doubt dealings of barter and traffic were carried on at these fairs long before the first Greek or Phoenician vessel entered the western sea. When bad harvests had occurred, different districts supplied each other at these fairs with grain; there, too, they exchanged cattle, slaves, metals, and whatever other articles were deemed needful or desirable in those primitive times. Oxen and sheep formed the oldest medium of exchange, ten sheep being reckoned equivalent to one ox. The recognition of these objects as universal legal representatives of value or in other words as money, as well as the scale of proportion between the large and smaller cattle, may be traced back—as the recurrence of both especially among the Germans shows—not merely to the Graeco-Italian period, but beyond this even to the epoch of a purely pastoral economy. (16) In Italy, where metal in considerable quantity was everywhere required especially for agricultural purposes and for armour, but few of its provinces themselves produced the requisite metals, copper (-aes-) very early made its appearance alongside of cattle as a second medium of exchange; and so the Latins, who were poor in copper, designated valuation itself as “coppering” (-aestimatio-). This establishment of copper as a general equivalent recognized throughout the whole peninsula, as well as the simplest numeral signs of Italian invention to be mentioned more particularly below (17) and the Italian duodecimal system, may be regarded as traces of this earliest international intercourse of the Italian peoples while they still had the peninsula to themselves.

Transmarine Traffic of the Italians

We have already indicated generally the nature of the influence exercised by transmarine commerce on the Italians who continued independent. The Sabellian stocks remained almost wholly unaffected by it. They were in possession of but a small and inhospitable belt of coast, and received whatever reached them from foreign nations—the alphabet for instance—only through the medium of the Tuscans or Latins; a circumstance which accounts for their want of urban development. The intercourse of Tarentum with the Apulians and Messapians appears to have been at this epoch still unimportant. It was otherwise along the west coast. In Campania the Greeks and Italians dwelt peacefully side by side, and in Latium, and still more in Etruria, an extensive and regular exchange of commodities took place. What were the earliest articles of import, may be inferred partly from the objects found in the primitive tombs, particularly those at Caere, partly from indications preserved in the language and institutions of the Romans, partly and chiefly from the stimulus given to Italian industry; for of course they bought foreign manufactures for a considerable time before they began to imitate them. We cannot determine how far the development of handicrafts had advanced before

Page 176

the separation of the stocks, or what progress it thereafter made while Italy remained left to its own resources; it is uncertain how far the Italian fullers, dyers, tanners, and potters received their impulse from Greece or Phoenicia or had their own independent development. But certainly the trade of the goldsmiths, which existed in Rome from time immemorial, can only have arisen after transmarine commerce had begun and ornaments of gold had to some extent found sale among the inhabitants of the peninsula. We find, accordingly, in the oldest sepulchral chambers of Caere and Vulci in Etruria and of Praeneste in Latium, plates of gold with winged lions stamped upon them, and similar ornaments of Babylonian manufacture. It may be a question in reference to the particular object found, whether it has been introduced from abroad or is a native imitation; but on the whole it admits of no doubt that all the west coast of Italy in early times imported metallic wares from the East. It will be shown still more clearly in the sequel, when we come to speak of the exercise of art, that architecture and modelling in clay and metal received a powerful stimulus in very early times through Greek influence, or, in other words, that the oldest tools and the oldest models came from Greece. In the sepulchral chambers just mentioned, besides the gold ornaments, there were deposited vessels of bluish enamel or greenish clay, which, judging from the materials and style as well as from the hieroglyphics impressed upon them, were of Egyptian origin;(18) perfume-vases of Oriental alabaster, several of them in the form of Isis; ostrich-eggs with painted or carved sphinxes and griffins; beads of glass and amber. These last may have come by the land-route from the north; but the other objects prove the import of perfumes and articles of ornament of all sorts from the East. Thence came linen and purple, ivory and frankincense, as is proved by the early use of linen fillets, of the purple dress and ivory sceptre for the king, and of frankincense in sacrifice, as well as by the very ancient borrowed names for them (—linon—, -linum-; —porphura—, -purpura-; —skeiptron—, —skipon—, -scipio-; perhaps also —elephas—, -ebur-; —thuos—, -thus-). Of similar significance is the derivation of a number of words relating to articles used in eating and drinking, particularly the names of oil,(19) of jugs (—amphoreus—, -amp(h)ora-, -ampulla-, —krateir—, -cratera-), of feasting (—komazo—, -comissari-), of a dainty dish (—opsonion—, -opsonium-) of dough (—maza—, -massa-), and various names of cakes (—glukons—, -lucuns-; —plakons—, -placenta-; —turons—, -turunda-); while conversely the Latin names for dishes (-patina-, —patanei—) and for lard (-arvina-, —arbinei—) have found admission into Sicilian Greek. The later custom of placing in the tomb beside the dead Attic, Corcyrean, and Campanian vases proves, what these testimonies from language likewise show, the

Page 177

early market for Greek pottery in Italy. That Greek leather-work made its way into Latium at least in the shape of armour is apparent from the application of the Greek word for leather —skutos— to signify among the Latins a shield (-scutum-; like -lorica-, from -lorum-). Finally, we deduce a similar inference from the numerous nautical terms borrowed from the Greek (although it is remarkable that the chief technical expressions in navigation—the terms for the sail, mast, and yard—are pure Latin forms);(20) and from the recurrence in Latin of the Greek designations for a letter (—epistolei—, -epistula-), a token (-tessera-, from —tessara—(21)), a balance (—stateir—, -statera-), and earnest-money (—arrabon—, -arrabo-, -arra-); and conversely from the adoption of Italian law-terms in Sicilian Greek,(22) as well as from the exchange of the proportions and names of coins, weights, and measures, which we shall notice in the sequel. The character of barbarism which all these borrowed terms obviously present, and especially the characteristic formation of the nominative from the accusative (-placenta- = —plakounta—; -ampora- = —amphorea—; -statera- = —stateira—), constitute the clearest evidence of their great antiquity. The worship of the god of traffic (-Mercurius-) also appears to have been from the first influenced by Greek conceptions; and his annual festival seems even to have been fixed on the ides of May, because the Hellenic poets celebrated him as the son of the beautiful Maia.

Commerce, in Latium Passive, in Etruria Active

It thus appears that Italy in very ancient times derived its articles of luxury, just as imperial Rome did, from the East, before it attempted to manufacture for itself after the models which it imported. In exchange it had nothing to offer except its raw produce, consisting especially of its copper, silver, and iron, but including also slaves and timber for shipbuilding, amber from the Baltic, and, in the event of bad harvests occurring abroad, its grain. From this state of things as to the commodities in demand and the equivalents to be offered in return, we have already explained why Italian traffic assumed in Latium a form so differing from that which it presented in Etruria. The Latins, who were deficient in all the chief articles of export, could carry on only a passive traffic, and were obliged even in the earliest times to procure the copper of which they had need from the Etruscans in exchange for cattle or slaves—we have already mentioned the very ancient practice of selling the latter on the right bank of the Tiber. (23) On the other hand the Tuscan balance of trade must have been necessarily favourable in Caere as in Populonia, in Capua as in Spina. Hence the rapid development of prosperity in these regions and their powerful commercial position; whereas Latium remained preeminently an agricultural country. The same contrast recurs

Page 178

in all their individual relations. The oldest tombs constructed and furnished in the Greek fashion, but with an extravagance to which the Greeks were strangers, are to be found at Caere, while—with the exception of Praeneste, which appears to have occupied a peculiar position and to have been very intimately connected with Falerii and southern Etruria—the Latin land exhibits only slight ornaments for the dead of foreign origin, and not a single tomb of luxury proper belonging to the earlier times; there as among the Sabellians a simple turf ordinarily sufficed as a covering for the dead. The most ancient coins, of a time not much later than those of Magna Graecia, belong to Etruria, and to Populonia in particular: during the whole regal period Latium had to be content with copper by weight, and had not even introduced foreign coins, for the instances are extremely rare in which such coins (e.g. one of Posidonia) have been found there. In architecture, plastic art, and embossing, the same stimulants acted on Etruria and on Latium, but it was only in the case of the former that capital was everywhere brought to bear on them and led to their being pursued extensively and with growing technical skill. The commodities were upon the whole the same, which were bought, sold, and manufactured in Latium and in Etruria; but the southern land was far inferior to its northern neighbours in the energy with which its commerce was plied. The contrast between them in this respect is shown in the fact that the articles of luxury manufactured after Greek models in Etruria found a market in Latium, particularly at Praeneste, and even in Greece itself, while Latium hardly ever exported anything of the kind.

Etrusco-Attic, and Latino-Sicilian Commerce

A distinction not less remarkable between the commerce of the Latins and that of the Etruscans appears in their respective routes or lines of traffic. As to the earliest commerce of the Etruscans in the Adriatic we can hardly do more than express the conjecture that it was directed from Spina and Atria chiefly to Corcyra. We have already mentioned(24) that the western Etruscans ventured boldly into the eastern seas, and trafficked not merely with Sicily, but also with Greece proper. An ancient intercourse with Attica is indicated by the Attic clay vases, which are so numerous in the more recent Etruscan tombs, and had been perhaps even at this time introduced for other purposes than the already-mentioned decoration of tombs, while conversely Tyrrhenian bronze candlesticks and gold cups were articles early in request in Attica. Still more definitely is such an intercourse indicated by the coins. The silver pieces of Populonia were struck after the pattern of a very old silver piece stamped on one side with the Gorgoneion, on the other merely presenting an incuse square, which has been found at Athens and on the old amber-route in

Page 179

the district of Posen, and which was in all probability the very coin struck by order of Solon in Athens. We have mentioned already that the Etruscans had also dealings, and perhaps after the development of the Etrusco-Carthaginian maritime alliance their principal dealings, with the Carthaginians. It is a remarkable circumstance that in the oldest tombs of Caere, besides native vessels of bronze and silver, there have been found chiefly Oriental articles, which may certainly have come from Greek merchants, but more probably were introduced by Phoenician traders. We must not, however, attribute too great importance to this Phoenician trade, and in particular we must not overlook the fact that the alphabet, as well as the other influences that stimulated and matured native culture, were brought to Etruria by the Greeks, and not by the Phoenicians.

Latin commerce assumed a different direction. Rarely as we have opportunity of instituting comparisons between the Romans and the Etruscans as regards the reception of Hellenic elements, the cases in which such comparisons can be instituted exhibit the two nations as completely independent of each other. This is most clearly apparent in the case of the alphabet. The Greek alphabet brought to the Etruscans from the Chalcidico-Doric colonies in Sicily or Campania varies not immaterially from that which the Latins derived from the same quarter, so that, although both peoples have drawn from the same source, they have done so at different times and different places. The same phenomenon appears in particular words: the Roman Pollux and the Tuscan Pultuke are independent corruptions of the Greek Polydeukes; the Tuscan Utuze or Uthuze is formed from Odysseus, the Roman Ulixes is an exact reproduction of the form of the name usual in Sicily; in like manner the Tuscan Aivas corresponds to the old Greek form of this name, the Roman Aiax to a secondary form that was probably also Sicilian; the Roman Aperta or Apello and the Samnite Appellun have sprung from the Doric Apellon, the Tuscan Apulu from Apollon. Thus the language and writing of Latium indicate that the direction of Latin commerce was exclusively towards the Cumaeans and Siceliots. Every other trace which has survived from so remote an age leads to the same conclusion: such as, the coin of Posidonia found in Latium; the purchase of grain, when a failure of the harvest occurred in Rome, from the Volscians, Cumaeans, and Siceliots (and, as was natural, from the Etruscans as well); above all, the relations subsisting between the Latin and Sicilian monetary systems. As the local Dorico-Chalcidian designation of silver coin —nomos—, and the Sicilian measure —eimina—, were transferred with the same meaning to Latium as -nummus- and -hemina-, so conversely the Italian designations of weight, -libra-, -triens-, -quadrans-, -sextans-, -uncia-, which arose in Latium for the measurement of the copper which was used by weight instead of

Page 180

money, had found their way into the common speech of Sicily in the third century of the city under the corrupt and hybrid forms, —litra—, —trias—, —tetras—, —exas—, —ouugia—. Indeed, among all the Greek systems of weights and moneys, the Sicilian alone was brought into a determinate relation to the Italian copper-system; not only was the value of silver set down conventionally and perhaps legally as two hundred and fifty times that of copper, but the equivalent on this computation of a Sicilian pound of copper (1/120th of the Attic talent, 2/3 of the Roman pound) was in very early times struck, especially at Syracuse, as a silver coin (—litra argurion—, *i.e.* “copper-pound in silver”). Accordingly it cannot be doubted that Italian bars of copper circulated also in Sicily instead of money; and this exactly harmonizes with the hypothesis that the commerce of the Latins with Sicily was a passive commerce, in consequence of which Latin money was drained away thither. Other proofs of ancient intercourse between Sicily and Italy, especially the adoption in the Sicilian dialect of the Italian expressions for a commercial loan, a prison, and a dish, and the converse reception of Sicilian terms in Italy, have been already mentioned.⁽²⁵⁾ We meet also with several, though less definite, traces of an ancient intercourse of the Latins with the Chalcidian cities in Lower Italy, Cumae and Neapolis, and with the Phocaeans in Velia and Massilia. That it was however far less active than that with the Siceliots is shown by the well-known fact that all the Greek words which made their way in earlier times to Latium exhibit Doric forms—we need only recall -Aesculapius-, -Latona-, -Aperta-, -machina-. Had their dealings with the originally Ionian cities, such as Cumae⁽²⁶⁾ and the Phocaean settlements, been even merely on a similar scale with those which they had with the Sicilian Dorians, Ionic forms would at least have made their appearance along with the others; although certainly Dorism early penetrated even into these Ionic colonies themselves, and their dialect varied greatly. While all the facts thus combine to attest the stirring traffic of the Latins with the Greeks of the western main generally, and especially with the Sicilians, there hardly occurred any immediate intercourse with the Asiatic Phoenicians, and the intercourse with those of Africa, which is sufficiently attested by statements of authors and by articles found, can only have occupied a secondary position as affecting the state of culture in Latium; in particular it is significant that—if we leave out of account some local names—there is an utter absence of any evidence from language as to ancient intercourse between the Latins and the nations speaking the Aramaic tongue.⁽²⁷⁾

Page 181

If we further inquire how this traffic was mainly carried on, whether by Italian merchants abroad or by foreign merchants in Italy, the former supposition has all the probabilities in its favour, at least so far as Latium is concerned. It is scarcely conceivable that those Latin terms denoting the substitute for money and the commercial loan could have found their way into general use in the language of the inhabitants of Sicily through the mere resort of Sicilian merchants to Ostia and their receipt of copper in exchange for ornaments. Lastly, in regard to the persons and classes by whom this traffic was carried on in Italy, no special superior class of merchants distinct from and independent of the class of landed proprietors developed itself in Rome. The reason of this surprising phenomenon was, that the wholesale commerce of Latium was from the beginning in the hands of the large landed proprietors—a hypothesis which is not so singular as it seems. It was natural that in a country intersected by several navigable rivers the great landholder, who was paid by his tenants their quotas of produce in kind, should come at an early period to possess barks; and there is evidence that such was the case. The transmarine traffic conducted on the trader's own account must therefore have fallen into the hands of the great landholder, seeing that he alone possessed the vessels for it and—in his produce—the articles for export.(28) In fact the distinction between a landed and a moneyed aristocracy was unknown to the Romans of earlier times; the great landholders were at the same time the speculators and the capitalists. In the case of a very energetic commerce such a combination certainly could not have been maintained; but, as the previous representation shows, while there was a comparatively vigorous traffic in Rome in consequence of the trade of the Latin land being there concentrated, Rome was by no means essentially a commercial city like Caere or Tarentum, but was and continued to be the centre of an agricultural community.

Notes for Book I Chapter XIII

1. I. II. Agriculture
2. I. III. Clan Villages, I. V. The Community
3. The system which we meet with in the case of the Germanic joint tillage, combining a partition of the land in property among the clansmen with its joint cultivation by the clan, can hardly ever have existed in Italy. Had each clansman been regarded in Italy, as among the Germans, in the light of proprietor of a particular spot in each portion of the collective domain that was marked off for tillage, the separate husbandry of later times would probably have set out from a minute subdivision of hides. But the very opposite was the case; the individual names of the Roman hides (-fundus Cornelianus-) show clearly that the Roman proprietor owned from the beginning a possession not broken up but united.

Page 182

4. Cicero (de Rep. ii. 9, 14, comp. Plutarch, Q. Rom. 15) states: -Tum (in the time of Romulus) erat res in pecore et locorum possessionibus, ex quo pecuniosi et locupletes vocabantur—(Numa) primum agros, quos bello Romulus ceperat, divisit viritim civibus-. In like manner Dionysius represents Romulus as dividing the land into thirty curial districts, and Numa as establishing boundary-stones and introducing the festival of the Terminalia (i. 7, ii. 74; and thence Plutarch, -Numa-, 16).

5. I. XI. Contracts

6. Since this assertion still continues to be disputed, we shall let the numbers speak for themselves. The Roman writers on agriculture of the later republic and the imperial period reckon on an average five -modii- of wheat as sufficient to sow a -jugerum-, and the produce as fivefold. The produce of a -heredium- accordingly (even when, without taking into view the space occupied by the dwelling-house and farm-yard, we regard it as entirely arable land, and make no account of years of fallow) amounts to fifty, or deducting the seed forty, modii. For an adult hard-working slave Cato (c. 56) reckons fifty-one -modii- of wheat as the annual consumption. These data enable any one to answer for himself the question whether a Roman family could or could not subsist on the produce of a -heredium-. The attempted proof to the contrary is based on the ground that the slave of later times subsisted more exclusively on corn than the free farmer of the earlier epoch, and that the assumption of a fivefold return is one too low for this earlier epoch; both assumptions are probably correct, but for both there is a limit. Doubtless the subsidiary produce yielded by the arable land itself and by the common pasture, such as figs, vegetables, milk, flesh (especially as derived from the old and zealously pursued rearing of swine), and the like, are specially to be taken into account for the older period; but the older Roman pastoral husbandry, though not unimportant, was withal of subordinate importance, and the chief subsistence of the people was always notoriously grain. We may, moreover, on account of the thoroughness of the earlier cultivation obtain a very considerable increase, especially of the gross produce—and beyond doubt the farmers of this period drew a larger produce from their lands than the great landholders of the later republic and the empire obtained (iii. Latium); but moderation must be exercised in forming such estimates, because we have to deal with a question of averages and with a mode of husbandry conducted neither methodically nor with large capital. The assumption of a tenfold instead of a fivefold return will be the utmost limit, and yet it is far from sufficing. In no case can the enormous deficit, which is left even according to those estimates between the produce of the -heredium- and the requirements of the household, be covered by mere superiority of cultivation. In fact the counter-proof can only be regarded as successful, when it shall have produced a methodical calculation based on rural economics, according to which among a population chiefly subsisting on vegetables the produce of a piece of land of an acre and a quarter proves sufficient on an average for the subsistence of a family.

Page 183

It is indeed asserted that instances occur even in historical times of colonies founded with allotments of two -jugera-; but the only instance of the kind (Liv. iv. 47) is that of the colony of Labici in the year 336—an instance, which will certainly not be reckoned (by such scholars as are worth the arguing with) to belong to the class of traditions that are trustworthy in their historical details, and which is beset by other very serious difficulties (see book ii. ch. 5, note). It is no doubt true that in the non-colonial assignation of land to the burgesses collectively (-adsignatio viritana-) sometimes only a few -jugera- were granted (as e. g. Liv. viii. ii, 21). In these cases however it was the intention not to create new farms with the allotments, but rather, as a rule, to add to the existing farms new parcels from the conquered lands (comp. C. I. L. i. p. 88). At any rate, any supposition is better than a hypothesis which requires us to believe as it were in a miraculous multiplication of the food of the Roman household. The Roman farmers were far less modest in their requirements than their historiographers; they themselves conceived that they could not subsist even on allotments of seven -jugera- or a produce of one hundred and forty -modii-.

7. I. Vi. Time and Occasion of the Reform

8. Perhaps the latest, although probably not the last, attempt to prove that a Latin farmer's family might have subsisted on two -jugera- of land, finds its chief support in the argument that Varro (de R. R. i. 44, i) reckons the seed requisite for the -jugerum-at five -modii- of wheat but ten -modii- of spelt, and estimates the produce as corresponding to this, whence it is inferred that the cultivation of spelt yielded a produce, if not double, at least considerably higher than that of wheat. But the converse is more correct, and the nominally higher quantity sown and reaped is simply to be explained by the fact that the Romans garnered and sowed the wheat already shelled, but the spelt still in the husk (Pliny, H. N. xviii. 7, 61), which in this case was not separated from the fruit by threshing. For the same reason spelt is at the present day sown twice as thickly as wheat, and gives a produce twice as great by measure, but less after deduction of the husks. According to Wurtemberg estimates furnished to me by G. Hanssen, the average produce of the Wurtemberg -morgen- is reckoned in the case of wheat (with a sowing of $\frac{1}{4}$ to $\frac{1}{2}$ -scheffel-) at 3 -scheffel- of the medium weight of 275 lbs. (= 825 lbs.); in the case of spelt (with a sowing of $\frac{1}{2}$ to $1\frac{1}{2}$ -scheffel-) at least 7 -scheffel- of the medium weight of 150 lbs. (= 1050 lbs.), which are reduced by shelling to about 4 -scheffel-. Thus spelt compared with wheat yields in the gross more than double, with equally good soil perhaps triple the crop, but—by specific weight—before the shelling not much above, after shelling (as “kernel”) less than, the half. It was not by mistake,

Page 184

as has been asserted, but because it was fitting in computations of this sort to start from estimates of a like nature handed down to us, that the calculation instituted above was based on wheat; it may stand, because, when transferred to spelt, it does not essentially differ and the produce rather falls than rises. Spelt is less nice as to soil and climate, and exposed to fewer risks than wheat; but the latter yields on the whole, especially when we take into account the not inconsiderable expenses of shelling, a higher net produce (on an average of fifty years in the district of Frankenthal in Rhenish Bavaria the -malter- of wheat stands at 11 -gulden- 3 krz., the -malter- of spelt at 4 -gulden-30 krz.), and, as in South Germany, where the soil admits, the growing of wheat is preferred and generally with the progress of cultivation comes to supersede that of spelt, so the analogous transition of Italian agriculture from the culture of spelt to that of wheat was undeniably a progress.

9. I. II. Agriculture

10. -Oleum- and -oliva- are derived from —elaion—, —elaia—, and -amurca- (oil-less) from —amorgei—.

11. But there is no proper authority for the statement that the fig-tree which stood in front of the temple of Saturn was cut down in the year 260 (Plin. H. N. xv. 18, 77); the date CCLX. is wanting in all good manuscripts, and has been interpolated, probably with reference to Liv. ii. 21.

15. I. XII. Oldest Table of Roman Festivals

16. The comparative legal value of sheep and oxen, as is well known, is proved by the fact that, when the cattle-fines were converted into money-fines, the sheep was rated at ten, and the ox at a hundred asses (Festus, v. -peculatus-, p. 237, comp. pp. 34, 144; Gell. xi. i; Plutarch, Poplicola, ii). By a similar adjustment the Icelandic law makes twelve rams equivalent to a cow; only in this as in other instances the Germanic law has substituted the duodecimal for the older decimal system.

It is well known that the term denoting cattle was transferred to denote money both among the Latins (-pecunia-) and among the Germans (English fee).

17. I. XIV. Decimal System

18. There has lately been found at Praeneste a silver mixing-jug, with a Phoenician and a hieroglyphic inscription (Mon. dell Inst. x. plate 32), which directly proves that such Egyptian wares as come to light in Italy have found their way thither through the medium of the Phoenicians.

19. comp. I. XIII. Culture of the Olive

Page 185

20. -Velum- is certainly of Latin origin; so is -malus-, especially as that term denotes not merely the mast, but the tree in general: -antenna- likewise may come from —ana— (-anhelare-, -antestari-), and -tendere- = -supertensa-. Of Greek origin, on the other hand, are -gubenare-, to steer (—kubernan—); -ancora-, anchor (—agkura—); -prora-, ship's bow (—prora—); -aplustre-, ship's stern (—aphlaston—); -anquina-, the rope fastening the yards (—agkoina—); -nausea-, sea-sickness (—nausia—). The four chief winds of the ancients- -aquilo-, the "eagle-wind," the north-easterly Tramontana; -voltumus- (of uncertain derivation, perhaps the "vulture-wind"), the south-easterly; -auster- the "scorching" southwest wind, the Sirocco; -favonius-, the "favourable" north-west wind blowing from the Tyrrhene Sea—have indigenous names bearing no reference to navigation; but all the other Latin names for winds are Greek (such as -eurus-, -notus-), or translations from the Greek (e.g. -solanus- = —apelioteis—, -Africus- = —lips—).

21. This meant in the first instance the tokens used in the service of the camp, the —xuleiphia kata phulakein brachea teleos echonta caracteira— (Polyb. vi. 35, 7); the four -vigiliae- of the night-service gave name to the tokens generally. The fourfold division of the night for the service of watching is Greek as well as Roman; the military science of the Greeks may well have exercised an influence—possibly through Pyrrhus (Liv. xxxv. 14)—in the organization of the measures for security in the Roman camp. The employment of the non-Doric form speaks for the comparatively late date at which the word was taken over.

27. If we leave out of view -Sarranus-, -Afer-, and other local designations (I. X. Phoenicians and Italians in Opposition to the Hellenes), the Latin language appears not to possess a single word immediately derived in early times from the Phoenician. The very few words from Phoenician roots which occur in it, such as -arrabo- or -arra- and perhaps also -murra-, -nardus-, and the like, are plainly borrowed proximately from the Greek, which has a considerable number of such words of Oriental extraction as indications of its primitive intercourse with the Aramaeans. That —elephas— and -ebur- should have come from the same Phoenician original with or without the addition of the article, and thus have been each formed independently, is a linguistic impossibility, as the Phoenician article is in reality -ha-, and is not so employed; besides the Oriental

primitive word has not as yet been found. The same holds true of the enigmatical word -thesaurus-; whether it may have been originally Greek or borrowed by the Greeks from the Phoenician or Persian, it is at any rate, as a Latin word, derived from the Greek, as the very retaining of its aspiration proves (xii. Foreign Worships).

Page 186

28. Quintus Claudius, in a law issued shortly before 534, prohibited the senators from having sea-going vessels holding more than 300 -amphorae- (1 amph. = nearly 6 gallons): -id satis habitum ad fructus ex agris vectandos; quaestus omnis patribus indecorus visus- (Liv. xxi. 63). It was thus an ancient usage, and was still permitted, that the senators should possess sea-going vessels for the transport of the produce of their estates: on the other hand, transmarine mercantile speculation (-quaestus-, traffic, fitting-out of vessels, &c.) on their part was prohibited. It is a curious fact that the ancient Greeks as well as the Romans expressed the tonnage of their sea-going ships constantly in amphorae; the reason evidently being, that Greece as well as Italy exported wine at a comparatively early period, and on a larger scale than any other bulky article.

CHAPTER XIV

Measuring and Writing

The art of measuring brings the world into subjection to man; the art of writing prevents his knowledge from perishing along with himself; together they make man—what nature has not made him—all-powerful and eternal. It is the privilege and duty of history to trace the course of national progress along these paths also.

Italian Measures

Measurement necessarily presupposes the development of the several ideas of units of time, of space, and of weight, and of a whole consisting of equal parts, or in other words of number and of a numeral system. The most obvious bases presented by nature for this purpose are, in reference to time, the periodic returns of the sun and moon, or the day and the month; in reference to space, the length of the human foot, which is more easily applied in measuring than the arm; in reference to gravity, the burden which a man is able to poise (-librare-) on his hand while he holds his arm stretched out, or the “weight” (-libra-). As a basis for the notion of a whole made up of equal parts, nothing so readily suggests itself as the hand with its five, or the hands with their ten, fingers; upon this rests the decimal system. We have already observed that these elements of all numeration and measuring reach back not merely beyond the separation of the Greek and Latin stocks, but even to the most remote primeval times. The antiquity in particular of the measurement of time by the moon is demonstrated by language;(1) even the mode of reckoning the days that elapse between the several phases of the moon, not forward from the phase on which it had entered last, but backward from that which was next to be expected, is at least older than the separation of the Greeks and Latins.

Decimal System

Page 187

The most definite evidence of the antiquity and original exclusive use of the decimal system among the Indo-Germans is furnished by the well-known agreement of all Indo-Germanic languages in respect to the numerals as far as a hundred inclusive.(2) In the case of Italy the decimal system pervaded all the earliest arrangements: it may be sufficient to recall the number ten so usual in the case of witnesses, securities, envoys, and magistrates, the legal equivalence of one ox and ten sheep, the partition of the canton into ten curies and the pervading application generally of the decurial system, the -limitatio-, the tenth in offerings and in agriculture, decimation, and the praenomen -Decimus-. Among the applications of this most ancient decimal system in the sphere of measuring and of writing, the remarkable Italian ciphers claim a primary place. When the Greeks and Italians separated, there were still evidently no conventional signs of number. On the other hand we find the three oldest and most indispensable numerals, one, five, and ten, represented by three signs—I, V or Λ, X, manifestly imitations of the outstretched finger, and the open hand single and double—which were not derived either from the Hellenes or the Phoenicians, but were common to the Romans, Sabellians, and Etruscans. They were the first steps towards the formation of a national Italian writing, and at the same time evidences of the liveliness of that earlier inland intercourse among the Italians which preceded their transmarine commerce.(3) Which of the Italian stocks invented, and which of them borrowed, these signs, can of course no longer be ascertained. Other traces of the pure decimal system occur but sparingly in this field; among them are the -versus-, the Sabellian measure of surface of 100 square feet,(4) and the Roman year of 10 months.

The Duodecimal System

Otherwise generally in the case of those Italian measures, which were not connected with Greek standards and were probably developed by the Italians before they came into contact with the Greeks, there prevailed the partition of the “whole” (-as-) into twelve “units” (-unciae-). The very earliest Latin priesthoods, the colleges of the Salii and Arvales,(5) as well as the leagues of the Etruscan cities, were organized on the basis of the number twelve. The same number predominated in the Roman system of weights and in the measures of length, where the pound (-libra-) and the foot (-pes-) were usually subdivided into twelve parts; the unit of the Roman measures of surface was the “driving” (-actus-) of 120 square feet, a combination of the decimal and duodecimal systems.(6) Similar arrangements as to the measures of capacity may have passed into oblivion.

Page 188

If we inquire into the basis of the duodecimal system and consider how it can have happened that, in addition to ten, twelve should have been so early and universally singled out from the equal series of numbers, we shall probably be able to find no other source to which it can be referred than a comparison of the solar and lunar periods. Still more than the double hand of ten fingers did the solar cycle of nearly twelve lunar periods first suggest to man the profound conception of an unit composed of equal units, and thereby originate the idea of a system of numbers, the first step towards mathematical thought. The consistent duodecimal development of this idea appears to have belonged to the Italian nation, and to have preceded the first contact with the Greeks.

Hellenic Measures in Italy

But when at length the Hellenic trader had opened up the route to the west coast of Italy, the measures of surface remained unaffected, but the measures of length, of weight, and above all of capacity—in other words those definite standards without which barter and traffic are impossible—experienced the effects of the new international intercourse. The oldest Roman foot has disappeared; that which we know, and which was in use at a very early period among the Romans, was borrowed from Greece, and was, in addition to its new Roman subdivision into twelfths, divided after the Greek fashion into four hand-breadths (-palmus-) and sixteen finger-breadths (-digitus-). Further, the Roman weights were brought into a fixed proportional relation to the Attic system, which prevailed throughout Sicily but not in Cumae—another significant proof that the Latin traffic was chiefly directed to the island; four Roman pounds were assumed as equal to three Attic -minae-, or rather the Roman pound was assumed as equal to one and a half of the Sicilian -litrae- or half-minae.(7) But the most singular and chequered aspect is presented by the Roman measures of capacity, as regards both their names and their proportions. Their names have come from the Greek terms either by corruption (-amphora-, -modius- after —medimnos—, -congius- from —choeus—, -hemina-, -cyathus-) or by translation (-acetabulum-from —ozubaphon—); while conversely —zesteis— is a corruption of -sextarius-. All the measures are not identical, but those in most common use are so; among liquid measures the -congius- or -chus-, the -sextarius-, and the -cyathus-, the two last also for dry goods; the Roman -amphora- was equalized in water-weight to the Attic talent, and at the same time stood to the Greek —metretes— in the fixed ratio of 3:2, and to the Greek —medimnos— of 2:1. To one who can decipher the significance of such records, these names and numerical proportions fully reveal the activity and importance of the intercourse between the Sicilians and the Latins. The Greek numeral signs were not adopted; but the Roman probably

Page 189

availed himself of the Greek alphabet, when it reached him, to form ciphers for 50 and 1000, perhaps also for 100, out of the signs for the three aspirated letters which he had no use for. In Etruria the sign for 100 at least appears to have been obtained in a similar way. Afterwards, as usually happens, the systems of notation among the two neighbouring nations became assimilated by the adoption in substance of the Roman system in Etruria.

The Italian Calendar before the Period of Greek Influence in Italy

In like manner the Roman calendar—and probably that of the Italians generally—began with an independent development of its own, but subsequently came under the influence of the Greeks. In the division of time the returns of sunrise and sunset, and of the new and full moon, most directly arrest the attention of man; and accordingly the day and the month, determined not by cyclic calculation but by direct observation, were long the exclusive measures of time. Down to a late age sunrise and sunset were proclaimed in the Roman market-place by the public crier, and in like manner it may be presumed that in earlier times, at each of the four phases of the moon, the number of days that would elapse from that phase until the next was proclaimed by the priests. The mode of reckoning therefore in Latium—and the like mode, it may be presumed, was in use not merely among the Sabellians, but also among the Etruscans—was by days, which, as already mentioned, were counted not forward from the phase that had last occurred, but backward from that which was next expected; by lunar weeks, which varied in length between 7 and 8 days, the average length being $7 \frac{3}{8}$; and by lunar months which in like manner were sometimes of 29, sometimes of 30 days, the average duration of the synodical month being 29 days 12 hours 44 minutes. For some time the day continued to be among the Italians the smallest, and the month the largest, division of time. It was not until afterwards that they began to distribute day and night respectively into four portions, and it was much later still when they began to employ the division into hours; which explains why even stocks otherwise closely related differed in their mode of fixing the commencement of day, the Romans placing it at midnight, the Sabellians and the Etruscans at noon. No calendar of the year had, at least when the Greeks separated from the Italians, as yet been organized, for the names for the year and its divisions in the two languages have been formed quite independently of each other. Nevertheless the Italians appear to have already in the pre-Hellenic period advanced, if not to the arrangement of a fixed calendar, at any rate to the institution of two larger units of time. The simplifying of the reckoning according to lunar months by the application of the decimal system, which was usual among the Romans, and the designation of a term of ten months as a “ring”

Page 190

(-annus-) or complete year, bear in them all the traces of a high antiquity. Later, but still at a period very early and undoubtedly previous to the operation of Greek influences, the duodecimal system (as we have already stated) was developed in Italy, and, as it derived its very origin from the observation of the fact that the solar period was equal to twelve lunar periods, it was certainly applied in the first instance to the reckoning of time. This view accords with the fact that the individual names of the months—which can only have originated after the month was viewed as part of a solar year—particularly those of March and of May, were similar among the different branches of the Italian stock, while there was no similarity between the Italian names and the Greek. It is not improbable therefore that the problem of laying down a practical calendar which should correspond at once to the moon and the sun—a problem which may be compared in some sense to the quadrature of the circle, and the solution of which was only recognized as impossible and abandoned after the lapse of many centuries—had already employed the minds of men in Italy before the epoch at which their contact with the Greeks began; these purely national attempts to solve it, however, have passed into oblivion.

The Oldest Italo-Greek Calendar

What we know of the oldest calendar of Rome and of some other Latin cities—as to the Sabellian and Etruscan measurement of time we have no traditional information—is decidedly based on the oldest Greek arrangement of the year, which was intended to answer both to the phases of the moon and to the seasons of the solar year, constructed on the assumption of a lunar period of $29 \frac{1}{2}$ days and a solar period of $12 \frac{1}{2}$ lunar months or $368 \frac{3}{4}$ days, and on the regular alternation of a full month or month of thirty days with a hollow month or month of twenty-nine days and of a year of twelve with a year of thirteen months, but at the same time maintained in some sort of harmony with the actual celestial phenomena by arbitrary curtailments and intercalations. It is possible that this Greek arrangement of the year in the first instance came into use among the Latins without undergoing any alteration; but the oldest form of the Roman year which can be historically recognized varied from its model, not indeed in the cyclical result nor yet in the alternation of years of twelve with years of thirteen months, but materially in the designation and in the measuring off of the individual months. The Roman year began with the beginning of spring; the first month in it and the only one which bears the name of a god, was named from Mars (-Martius-), the three following from sprouting (-aprilis-) growing (-maius-), and thriving (-iunius-), the fifth onward to the tenth from their ordinal numbers (-quinctilis-, -sextilis-, -september-, -october-, -november-, -december), the eleventh from commencing (-ianuarius-),(8) with

Page 191

reference presumably to the renewal of agricultural operations that followed midwinter and the season of rest, the twelfth, and in an ordinary year the last, from cleansing (-februarius-). To this series recurring in regular succession there was added in the intercalary year a nameless "labour-month" (-mercedonius-) at the close of the year, viz. after February. And, as the Roman calendar was independent as respected the names of the months which were probably taken from the old national ones, it was also independent as regarded their duration. Instead of the four years of the Greek cycle, each composed of six months of 30 and six of 29 days and an intercalary month inserted every second year alternately of 29 and 30 days ($354 + 384 + 354 + 383 = 1475$ days), the Roman calendar substituted four years, each containing four months—the first, third, fifth, and eighth—of 31 days and seven of 29 days, with a February of 28 days during three years and of 29 in the fourth, and an intercalary month of 27 days inserted every second year ($355 + 383 + 355 + 382 = 1475$ days). In like manner this calendar departed from the original division of the month into four weeks, sometimes of 7, sometimes of 8 days; it made the eight-day-week run on through the years without regard to the other relations of the calendar, as our Sundays do, and placed the weekly market on the day with which it began (-noundinae-). Along with this it once for all fixed the first quarter in the months of 31 days on the seventh, in those of 29 on the fifth day, and the full moon in the former on the fifteenth, in the latter on the thirteenth day. As the course of the months was thus permanently arranged, it was henceforth necessary to proclaim only the number of days lying between the new moon and the first quarter; thence the day of the newmoon received the name of "proclamation-day" (-kalendae-). The first day of the second section of the month, uniformly of 8 days, was—in conformity with the Roman custom of reckoning, which included the -terminus ad quem—designated as "nine-day" (-nonae-). The day of the full moon retained the old name of -idus- (perhaps "dividing-day"). The motive lying at the bottom of this strange remodelling of the calendar seems chiefly to have been a belief in the salutary virtue of odd numbers;(9) and while in general it is based on the oldest form of the Greek year, its variations from that form distinctly exhibit the influence of the doctrines of Pythagoras, which were then paramount in Lower Italy, and which especially turned upon a mystic view of numbers. But the consequence was that this Roman calendar, clearly as it bears traces of the desire that it should harmonize with the course both of sun and moon, in reality by no means so corresponded with the lunar course as did at least on the whole its Greek model, while, like the oldest Greek cycle, it could only follow the solar seasons by means of frequent arbitrary excisions, and did in all probability

Page 192

follow them but very imperfectly, for it is scarcely likely that the calendar would be handled with greater skill than was manifested in its original arrangement. The retention moreover of the reckoning by months or—which is the same thing—by years of ten months implies a tacit, but not to be misunderstood, confession of the irregularity and untrustworthiness of the oldest Roman solar year. This Roman calendar may be regarded, at least in its essential features, as that generally current among the Latins. When we consider how generally the beginning of the year and the names of the months are liable to change, minor variations in the numbering and designations are quite compatible with the hypothesis of a common basis; and with such a calendar-system, which practically was irrespective of the lunar course, the Latins might easily come to have their months of arbitrary length, possibly marked off by annual festivals—as in the case of the Alban months, which varied between 16 and 36 days. It would appear probable therefore that the Greek —*trieteris*— had early been introduced from Lower Italy at least into Latium and perhaps also among the other Italian stocks, and had thereafter been subjected in the calendars of the several cities to further subordinate alterations.

For the measuring of periods of more than one year the regnal years of the kings might have been employed: but it is doubtful whether that method of dating, which was in use in the East, occurred in Greece or Italy during earlier times. On the other hand the intercalary period recurring every four years, and the census and lustration of the community connected with it, appear to have suggested a reckoning by -*lustra*- similar in plan to the Greek reckoning by Olympiads—a method, however, which early lost its chronological significance in consequence of the irregularity that now prevailed as to the due holding of the census at the right time.

Introduction of Hellenic Alphabets into Italy

The art of expressing sounds by written signs was of later origin than the art of measurement. The Italians did not any more than the Hellenes develop such an art of themselves, although we may discover attempts at such a development in the Italian numeral signs,(10) and possibly also in the primitive Italian custom—formed independently of Hellenic influence—of drawing lots by means of wooden tablets. The difficulty which must have attended the first individualizing of sounds—occurring as they do in so great a variety of combinations—is best demonstrated by the fact that a single alphabet propagated from people to people and from generation to generation has sufficed, and still suffices, for the whole of Aramaic, Indian, Graeco-Roman, and modern civilization; and this most important product of the human intellect was the joint creation of the Aramaeans and the Indo-Germans. The Semitic family of languages, in which the vowel has a subordinate character

Page 193

and never can begin a word, facilitates on that very account the individualizing of the consonants; and it was among the Semites accordingly that the first alphabet—in which the vowels were still wanting—was invented. It was the Indians and Greeks who first independently of each other and by very divergent methods created, out of the Aramaean consonantal writing brought to them by commerce, a complete alphabet by the addition of the vowels—which was effected by the application of four letters, which the Greeks did not use as consonantal signs, for the four vowels -a -e -i -o, and by the formation of a new sign for -u—in other words by the introduction of the syllable into writing instead of the mere consonant, or, as Palamedes says in Euripides,

—Ta teis ge leitheis pharmak orthosas monos
Aphona kai phonounta, sullabas te theis,
Ezeupon anthropoisi grammat eidenai.—

This Aramaeo-Hellenic alphabet was accordingly brought to the Italians through the medium, doubtless, of the Italian Hellenes; not, however, through the agricultural colonies of Magna Graecia, but through the merchants possibly of Cumae or Tarentum, by whom it would be brought in the first instance to the very ancient emporia of international traffic in Latium and Etruria—to Rome and Caere. The alphabet received by the Italians was by no means the oldest Hellenic one; it had already experienced several modifications, particularly the addition of the three letters —“id:xi”, —“id:phi”, —“id:chi” and the alteration of the signs for —“id:iota”, —“id:gamma”, —“id:lambda”.(11) We have already observed(12) that the Etruscan and Latin alphabets were not derived the one from the other, but both directly from the Greek; in fact the Greek alphabet came to Etruria in a form materially different from that which reached Latium. The Etruscan alphabet has a double sign -s (sigma -“id:s” and san -“id:sh”) and only a single -k,(13) and of the -r only the older form -“id:P”; the Latin has, so far as we know, only a single -s, but a double sign for -k (kappa -“id:k” and koppa -“id:q”) and of the -r almost solely the more recent form -“id:R”. The oldest Etruscan writing shows no knowledge of lines, and winds like the coiling of a snake; the more recent employs parallel broken-off lines from right to left: the Latin writing, as far as our monuments reach back, exhibits only the latter form of parallel lines, which originally perhaps may have run at pleasure from left to right or from right to left, but subsequently ran among the Romans in the former, and among the Faliscans in the latter direction. The model alphabet brought to Etruria must notwithstanding its comparatively remodelled character reach back to an epoch very ancient, though not positively to be determined; for, as the two sibilants sigma and san were always used by the Etruscans as different sounds side by side, the Greek alphabet which came to Etruria must doubtless still have possessed both of them in this way as living signs of sound; but among all the monuments of the Greek language known to us not one presents sigma and san in simultaneous use.

Page 194

The Latin alphabet certainly, as we know it, bears on the whole a more recent character; and it is not improbable that the Latins did not simply receive the alphabet once for all, as was the case in Etruria, but in consequence of their lively intercourse with their Greek neighbours kept pace for a considerable period with the alphabet in use among these, and followed its variations. We find, for instance, that the forms -"id:ΛV", -"id:P", (14) and -"id:Sigma" were not unknown to the Romans, but were superseded in common use by the later forms -"id:Λ", -"id:R", and -"id:S" —a circumstance which can only be explained by supposing that the Latins employed for a considerable period the Greek alphabet as such in writing either their mother-tongue or Greek. It is dangerous therefore to draw from the more recent character of the Greek alphabet which we meet with in Rome, as compared with the older character of that brought to Etruria, the inference that writing was practised earlier in Etruria than in Rome.

The powerful impression produced by the acquisition of the treasure of letters on those who received them, and the vividness with which they realized the power that slumbered in those humble signs, are illustrated by a remarkable vase from a sepulchral chamber of Caere built before the invention of the arch, which exhibits the old Greek model alphabet as it came to Etruria, and also an Etruscan syllabarium formed from it, which may be compared to that of Palamedes—evidently a sacred relic of the introduction and acclimatization of alphabetic writing in Etruria.

Development of Alphabets in Italy

Not less important for history than the derivation of the alphabet is the further course of its development on Italian soil: perhaps it is even of more importance; for by means of it a gleam of light is thrown upon the inland commerce of Italy, which is involved in far greater darkness than the commerce with foreigners on its coasts. In the earliest epoch of Etruscan writing, when the alphabet was used without material alteration as it had been introduced, its use appears to have been restricted to the Etruscans on the Po and in what is now Tuscany. In course of time this alphabet, manifestly diffusing itself from Atria and Spina, reached southward along the east coast as far as the Abruzzi, northward to the Veneti and subsequently even to the Celts at the foot of, among, and indeed beyond the Alps, so that its last offshoots reached as far as the Tyrol and Styria. The more recent epoch starts with a reform of the alphabet, the chief features of which were the introduction of writing in broken-off lines, the suppression of the -"id:o", which was no longer distinguished in pronunciation from the -"id:u", and the introduction of a new letter -"id:f" for which the alphabet as received by them had no corresponding sign. This reform evidently arose among the western Etruscans,

Page 195

and while it did not find reception beyond the Apennines, became naturalized among all the Sabellian tribes, and especially among the Umbrians. In its further course the alphabet experienced various fortunes in connection with the several stocks, the Etruscans on the Arno and around Capua, the Umbrians and the Samnites; frequently the mediae were entirely or partially lost, while elsewhere again new vowels and consonants were developed. But that West-Etruscan reform of the alphabet was not merely as old as the oldest tombs found in Etruria; it was considerably older, for the syllabarium just mentioned as found probably in one of these tombs already presents the reformed alphabet in an essentially modified and modernized shape; and, as the reformed alphabet itself is relatively recent as compared with the primitive one, the mind almost fails in the effort to reach back to the time when that alphabet came to Italy. While the Etruscans thus appear as the instruments in diffusing the alphabet in the north, east, and south of the peninsula, the Latin alphabet on the other hand was confined to Latium, and maintained its ground, upon the whole, there with but few alterations; only the letters -"id:gamma" -"id:kappa" and -"id:zeta" -"id:sigma" gradually became coincident in sound, the consequence of which was, that in each case one of the homophonous signs (-"id:kappa" -"id:zeta") disappeared from writing. In Rome it can be shown that these were already laid aside before the end of the fourth century of the city,(15) and the whole monumental and literary tradition that has reached us knows nothing of them, with a single exception.(16) Now when we consider that in the oldest abbreviations the distinction between -"id:gamma" -"id:c" and -"id:kappa" -"id:k" is still regularly maintained;(17) that the period, accordingly, when the sounds became in pronunciation coincident, and before that again the period during which the abbreviations became fixed, lies beyond the beginning of the Samnite wars; and lastly, that a considerable interval must necessarily have elapsed between the introduction of writing and the establishment of a conventional system of abbreviation; we must, both as regards Etruria and Latium, carry back the commencement of the art of writing to an epoch which more closely approximates to the first incidence of the Egyptian Sirius-period within historical times, the year 1321 B.C., than to the year 776, with which the chronology of the Olympiads began in Greece.(18) The high antiquity of the art of writing in Rome is evinced otherwise by numerous and plain indications. The existence of documents of the regal period is sufficiently attested; such was the special treaty between Rome and Gabii, which was concluded by a king Tarquinius and probably not by the last of that name, and which, written on the skin of the bullock sacrificed on the occasion, was preserved in the temple of Sancus on the Quirinal, which was rich in antiquities and

Page 196

probably escaped the conflagration of the Gauls; and such was the alliance which king Servius Tullius concluded with Latium, and which Dionysius saw on a copper tablet in the temple of Diana on the Aventine. What he saw, however, was probably a copy restored after the fire with the help of a Latin exemplar, for it was not likely that engraving on metal was practised as early as the time of the kings. The charters of foundation of the imperial period still refer to the charter founding this temple as the oldest document of the kind in Rome and the common model for all. But even then they scratched (-exarare-, -scribere-, akin to -scrobes- (19)) or painted (-linere-, thence -littera-) on leaves (-folium-), inner bark (-liber-), or wooden tablets (-tabula-, -album-), afterwards also on leather and linen. The sacred records of the Samnites as well as of the priesthood of Anagnia were inscribed on linen rolls, and so were the oldest lists of the Roman magistrates preserved in the temple of the goddess of recollection (-Iuno moneta-) on the Capitol. It is scarcely necessary to recall further proofs in the primitive marking of the pastured cattle (-scriptura-), in the mode of addressing the senate, "fathers and enrolled" (-patres conscripti-), and in the great antiquity of the books of oracles, the clan-registers, and the Alban and Roman calendars. When Roman tradition speaks of halls in the Forum, where the boys and girls of quality were taught to read and write, already in the earliest times of the republic, the statement may be, but is not necessarily to be deemed, an invention. We have been deprived of information as to the early Roman history, not in consequence of the want of a knowledge of writing, or even perhaps of the lack of documents, but in consequence of the incapacity of the historians of the succeeding age, which was called to investigate the history, to work out the materials furnished by the archives, and of the perversity which led them to desire for the earliest epoch a delineation of motives and of characters, accounts of battles and narratives of revolutions, and while engaged in inventing these, to neglect what the extant written tradition would not have refused to yield to the serious and self-denying inquirer.

Results

The history of Italian writing thus furnishes in the first place a confirmation of the weak and indirect influence exercised by the Hellenic character over the Sabellians as compared with the more western peoples. The fact that the former received their alphabet from the Etruscans and not from the Romans is probably to be explained by supposing that they already possessed it before they entered upon their migration along the ridge of the Apennines, and that therefore the Sabines as well as Samnites carried it along with them from the mother-land to their new abodes. On the other hand this history of writing contains a salutary warning against the adoption of the hypothesis,

Page 197

originated by the later Roman culture in its devotedness to Etruscan mysticism and antiquarian trifling, and patiently repeated by modern and even very recent inquirers, that Roman civilization derived its germ and its pith from Etruria. If this were the truth, some trace of it ought to be more especially apparent in this field; but on the contrary the germ of the Latin art of writing was Greek, and its development was so national, that it did not even adopt the very desirable Etruscan sign for *-id:f-*.⁽²⁰⁾ Indeed, where there is an appearance of borrowing, as in the numeral signs, it is on the part of the Etruscans, who took over from the Romans at least the sign for 50.

Corruption of Language and Writing

Lastly it is a significant fact, that among all the Italian stocks the development of the Greek alphabet primarily consisted in a process of corruption. Thus the *-mediae-* disappeared in the whole of the Etruscan dialects, while the Umbrians lost *-id:gamma-* and *-id:d-*, the Samnites *-id:d-*, and the Romans *-id:gamma-*; and among the latter *-id:d-* also threatened to amalgamate with *-id:r-*. In like manner among the Etruscans *-id:o-* and *-id:u-* early coalesced, and even among the Latins we meet with a tendency to the same corruption. Nearly the converse occurred in the case of the sibilants; for while the Etruscan retained the three signs *-id:z-*, *-id:s-*, *-id:sh-*, and the Umbrian rejected the last but developed two new sibilants in its room, the Samnite and the Faliscan confined themselves like the Greek to *-id:s-* and *-id:z-*, and the Roman of later times even to *-id:s-* alone. It is plain that the more delicate distinctions of sound were duly felt by the introducers of the alphabet, men of culture and masters of two languages; but after the national writing became wholly detached from the Hellenic mother-alphabet, the *-mediae-* and their *-tenues-* gradually came to coincide, and the sibilants and vowels were thrown into disorder—transpositions or rather destructions of sound, of which the first in particular is entirely foreign to the Greek. The destruction of the forms of flexion and derivation went hand in hand with this corruption of sounds. The cause of this barbarization was thus, upon the whole, simply the necessary process of corruption which is continuously eating away every language, where its progress is not stemmed by literature and reason; only in this case indications of what has elsewhere passed away without leaving a trace have been preserved in the writing of sounds. The circumstance that this barbarizing process affected the Etruscans more strongly than any other of the Italian stocks adds to the numerous proofs of their inferior capacity for culture. The fact on the other hand that, among the Italians, the Umbrians apparently were the most affected by a similar corruption of language, the Romans less so, the southern Sabellians least of all, probably finds its explanation, at least in part, in the more lively intercourse maintained by the former with the Etruscans, and by the latter with the Greeks.

9. From the same cause all the festival-days are odd, as well those recurring every month (-kalendae- on the 1st. -nonae- on the 5th or 7th, -idus- on the 13th or 15th), as also, with but two exceptions, those of the 45 annual festivals mentioned above (xii. Oldest Table Of Roman Festivals). This is carried so far, that in the case of festivals of several days the intervening even days were dropped out, and so, for example, that of Carmentis was celebrated on Jan. 11, 15, that of the Grove-festival (-Lucaria-) on July 19, 21, and that of the Ghosts-festival on May 9, 11, and 13.
10. I. XIV. Decimal System
11. The history of the alphabet among the Hellenes turns essentially on the fact that—assuming the primitive alphabet of 23 letters, that is to say, the Phoenician alphabet vocalized and enlarged by the addition of the -"id:u" —proposals of very various kinds were made to supplement and improve it, and each of these proposals has a history of its own. The most important of these, which it is interesting to keep in view as bearing on the history of Italian writing, are the following:—I. The introduction of special signs for the sounds —"id:xi" —"id:phi" —"id:chi". This proposal is so old that all the Greek alphabets—with the single exception of that of the islands Thera, Melos, and Crete—and all alphabets derived from the Greek without exception, exhibit its influence. At first probably the aim was to append the signs —"id:Chi" = —"id:xi iota", —"id:Phi" = —"id:phi iota", and —"id:Psi" = —"id:chi iota" to the close of the alphabet, and in this shape it was adopted on the mainland of Hellas—with the exception of Athens and Corinth—

and also among the Sicilian and Italian Greeks. The Greeks of Asia Minor on the other hand, and those of the islands of the Archipelago, and also the Corinthians on the mainland appear, when this proposal reached them, to have already had in use for the sound —“id:xi iota” the fifteenth sign of the Phoenician alphabet —“id:Xl” (Samech); accordingly of the three new signs they adopted the —“id:*Phi*” for —“id:phi iota”, but employed

Page 199

the —“id:Chi” not for —“id:xi iota”, but for —“id:chi iota”. The third sign originally invented for —“id:chi iota” was probably allowed in most instances to drop; only on the mainland of Asia Minor it was retained, but received the value of —“id:psi iota”. The mode of writing adopted in Asia Minor was followed also by Athens; only in its case not merely the —“id:psi iota”, but the —“id:xi iota” also, was not received and in their room the two consonants continued to be written as before.—II. Equally early, if not still earlier, an effort was made to obviate the confusion that might so easily occur between the forms for —“id:iota S” and for —“id:s E”; for all the Greek alphabets known to us bear traces of the endeavour to distinguish them otherwise and more precisely. Already in very early times two such proposals of change must have been made, each of which found a field for its diffusion. In the one case they employed for the sibilant—for which the Phoenician alphabet furnished two signs, the fourteenth (—“id:Λ”) for —“id:sh” and the eighteenth (—“id:E”) for —“id:s” —not the latter, which was in sound the more suitable, but the former; and such was in earlier times the mode of writing in the eastern islands, in Corinth and Corcyra, and among the Italian Achaeans. In the other case they substituted for the sign of —“id:i” the simple stroke —“id:l”, which was by far the more usual, and at no very late date became at least so far general that the broken —“id:iota S” everywhere disappeared, although individual communities retained the —“id:s” in the form —“id:Λ” alongside of the —“l”.—III. Of later date is the substitution of —“id:V” for —“id:Λ” (—“id:lambda”) which might readily be confounded with —“id:Gamma gamma”. This we meet with in Athens and Boeotia, while Corinth and the communities dependent on Corinth attained the same object by giving to the —“id:gamma” the semicircular form —“id:C” instead of the hook-shape.—IV. The forms for —“id:p” —“id:P (with broken-loop)” and —“id:r” —“id:P”, likewise very liable to be confounded, were distinguished by transforming the latter into —“id:R”; which more recent form was not used by the Greeks of Asia Minor, the Cretans, the Italian Achaeans, and a few other districts, but on the other hand greatly preponderated both in Greece proper and in Magna Graecia and Sicily. Still the older form of the —“id:r” —“id:P” did not so early and so completely disappear there as the older form of the —“id:l”; this alteration therefore beyond doubt is to be placed later.—V. The differentiating of the long and short -e and the long and short -o remained in the earlier times confined to the Greeks of Asia Minor and of the islands of the Aegean Sea.

Page 200

All these technical improvements are of a like nature and from a historical point of view of like value, in so far as each of them arose at a definite time and at a definite place and thereafter took its own mode of diffusion and found its special development. The excellent investigation of Kirchhoff (-Studien zur Geschichte des griechischen Alphabets-), which has thrown a clear light on the previously so obscure history of the Hellenic alphabet, and has also furnished essential data for the earliest relations between the Hellenes and Italians—establishing, in particular, incontrovertibly the previously uncertain home of the Etruscan alphabet—is affected by a certain one-sidedness in so far as it lays proportionally too great stress on a single one of these proposals. If systems are here to be distinguished at all, we may not divide the alphabets into two classes according to the value of the —“id:X” as —“id:zeta” or as —“id:chi”, but we shall have to distinguish the alphabet of 23 from that of 25 or 26 letters, and perhaps further in this latter case to distinguish the Ionic of Asia Minor, from which the later common alphabet proceeded, from the common Greek of earlier times. In dealing, however, with the different proposals for the modification of the alphabet the several districts followed an essentially eclectic course, so that one was received here and another there; and it is just in this respect that the history of the Greek alphabet is so instructive, because it shows how particular groups of the Greek lands exchanged improvements in handicraft and art, while others exhibited no such reciprocity. As to Italy in particular we have already called attention to the remarkable contrast between the Achaean agricultural towns and the Chalcidic and Doric colonies of a more mercantile character (x. Iono-Dorian Towns); in the former the primitive forms were throughout retained, in the latter the improved forms were adopted, even those which coming from different quarters were somewhat inconsistent, such as the —“id:C” —“id:gamma” alongside of the —“id:V” —“id:I”. The Italian alphabets proceed, as Kirchhoff has shown, wholly from the alphabet of the Italian Greeks and in fact from the Chalcidico-Doric; but that the Etruscans and Latins received their alphabet not the one from the other but both directly from the Greeks, is placed beyond doubt especially by the different form of the —“id:r”. For, while of the four modifications of the alphabet above described which concern the Italian Greeks (the fifth was confined to Asia Minor) the first three were already carried out before the alphabet passed to the Etruscans and Latins, the differentiation of —“id:p” and —“id:r” had not yet taken place when it came to Etruria, but on the other hand had at least begun when the Latins received it; for which reason the Etruscans do not at all know the form -“id:R” for -“id:r”, whereas among the Faliscans and the Latins, with the single exception of the Dressel vase (xiv. Note 14), the younger form is met with exclusively.

Page 201

12. I. XIII. Etrusco-Attic and Latino-Sicilian Commerce

13. That the Etruscans always were without the koppa, seems not doubtful; for not only is no sure trace of it to be met with elsewhere, but it is wanting in the model alphabet of the Galassi vase. The attempt to show its presence in the syllabarium of the latter is at any rate mistaken, for the syllabarium can and does only take notice of the Etruscan letters that were afterwards in common use, and to these the koppa notoriously did not belong; moreover the sign placed at the close cannot well from its position have any other value than that of the -f, which was in fact the last letter in the Etruscan alphabet, and which could not be omitted in a syllabarium exhibiting the variations of that alphabet from its model. It is certainly surprising that the koppa should be absent from the Greek alphabet that came to Etruria, when it otherwise so long maintained its place in the Chalcidico-Doric ; but this may well have been a local peculiarity of the town whose alphabet first reached Etruria. Caprice and accident have at all times had a share in determining whether a sign becoming superfluous shall be retained or dropped from the alphabet; thus the Attic alphabet lost the eighteenth Phoenician sign, but retained the others which had disappeared from the -u.

14. The golden bracelet of Praeneste recently brought to light (Mitth. der rom. Inst. 1887), far the oldest of the intelligible monuments of the Latin language and Latin writing, shows the older form of the -"id:m"; the enigmatic clay vase from the Quirinal (published by Dressel in the *Annali dell Instituto*, 1880) shows the older form of the -"id:r".

15. At this period we shall have to place that recorded form of the Twelve Tables, which subsequently lay before the Roman philologues, and of which we possess fragments. Beyond doubt the code was at its very origin committed to writing; but that those scholars themselves referred their text not to the original exemplar, but to an official document written down after the Gallic conflagration, is proved by the story of the Tables having undergone reproduction at that time. This enables us easily to explain how their text by no means exhibited the oldest orthography, which was not unknown to them; even apart from the consideration that in the case of such a written document, employed, moreover, for the purpose of being committed to memory by the young, a philologically exact transmission cannot possibly be assumed.

16. This is the inscription of the bracelet of Praeneste which has been mentioned at xiv, note 14. On the other hand even on the Ficoroni cista -"id:C" has the later form of -"id:K".

17. Thus -"id:C" represents -Gaius-; -"id:Cn" -Gnaeus-; while -"id:K" stands for -Kaes- . With the more recent abbreviations of course this is not the case; in these -"id:gamma" is represented not by -"id:C", but by -"id:G" (-Gal- -Galeria-), —"id:kappa", as a rule, by -"id:C" (-C- -centum- -cos- -consul; -col- -Collina-), or before -"id:a" by -"id:K" (-Kar- -karmetalia-; -Merk- -merkatus-). For they expressed for a time the sound

—k before the vowels -e -i -o and before all consonants by -"id:C", before -a on the other hand by -"id:K", before -u by the old sign of the koppa -"id:Q".

Page 202

18. If this view is correct, the origin of the Homeric poems (though of course not exactly that of the redaction in which we now have them) must have been far anterior to the age which Herodotus assigns for the flourishing of Homer (100 before Rome); for the introduction of the Hellenic alphabet into Italy, as well as the beginning of intercourse at all between Hellas and Italy, belongs only to the post-Homeric period.

19. Just as the old Saxon -writan- signifies properly to tear, thence to write.

20. The enigma as to how the Latins came to employ the Greek sign corresponding to -v for the -f quite different in sound, has been solved by the bracelet of Praeneste (xiv. Developments Of Alphabets in Italy, note) with its -fhefhaked- for -fecit-, and thereby at the same time the derivation of the Latin alphabet from the Chalcidian colonies of Lower Italy has been confirmed. For in a Boeotian inscription belonging to the same alphabet we find in the word -fhekadamoe- (Gustav Meyer, Griech. Grammatik, sec. 244, ap. fin.) the same combination of sound, and an aspirated v might certainly approximate in sound to the Latin -f.

20. -Ratio Tuscanica, : cavum aedium Tuscanicum.-

21. When Varro (ap. Augustin. De Civ. Dei, iv. 31; comp. Plutarch Num. 8) affirms that the Romans for more than one hundred and seventy years worshipped the gods without images, he is evidently thinking of this primitive piece of carving, which, according to the conventional chronology, was dedicated between 176 and 219, and, beyond doubt, was the first statue of the gods, the consecration of which was mentioned in the authorities which Varro had before him. Chapter XV

Art

Artistic Endowment of the Italians

Poetry is impassioned language, and its modulation is melody. While in this sense no people is without poetry and music, some nations have received a pre-eminent endowment of poetic gifts. The Italian nation, however, was not and is not one of these. The Italian is deficient in the passion of the heart, in the longing to idealize what

is human and to confer humanity on what is lifeless, which form the very essence of poetic art. His acuteness of perception and his graceful versatility enabled him to excel in irony and in the vein of tale-telling which we find in Horace and Boccaccio, in the humorous pleasantries of love and song which are presented in Catullus and in the good popular songs of Naples, above all in the lower comedy and in farce. Italian soil gave birth in ancient times to burlesque tragedy, and in modern times to mock-heroic poetry. In rhetoric and histrionic art especially no other

Page 203

nation equalled or equals the Italians. But in the more perfect kinds of art they have hardly advanced beyond dexterity of execution, and no epoch of their literature has produced a true epos or a genuine drama. The very highest literary works that have been successfully produced in Italy, divine poems like Dante's *Commedia*, and historical treatises such as those of Sallust and Macchiavelli, of Tacitus and Colletta, are pervaded by a passion more rhetorical than spontaneous. Even in music, both in ancient and modern times, really creative talent has been far less conspicuous than the accomplishment which speedily assumes the character of virtuosoship, and enthrones in the room of genuine and genial art a hollow and heart-withering idol. The field of the inward in art—so far as we may in the case of art distinguish an inward and an outward at all—is not that which has fallen to the Italian as his special province; the power of beauty, to have its full effect upon him, must be placed not ideally before his mind, but sensuously before his eyes. Accordingly he is thoroughly at home in architecture, painting, and sculpture; in these he was during the epoch of ancient culture the best disciple of the Hellenes, and in modern times he has become the master of all nations.

Dance, Music, and Song in Latium

From the defectiveness of our traditional information it is not possible to trace the development of artistic ideas among the several groups of nations in Italy; and in particular we are no longer in a position to speak of the poetry of Italy; we can only speak of that of Latium. Latin poetry, like that of every other nation, began in the lyrical form, or, to speak more correctly, sprang out of those primitive festal rejoicings, in which dance, music, and song were still inseparably blended. It is remarkable, however, that in the most ancient religious usages dancing, and next to dancing instrumental music, were far more prominent than song. In the great procession, with which the Roman festival of victory was opened, the chief place, next to the images of the gods and the champions, was assigned to the dancers grave and merry. The grave dancers were arranged in three groups of men, youths, and boys, all clad in red tunics with copper belts, with swords and short lances, the men being moreover furnished with helmets, and generally in full armed attire. The merry dancers were divided into two companies—"the sheep" in sheep-skins with a party-coloured over-garment, and "the goats" naked down to the waist, with a buck's skin thrown over them. In like manner the "leapers" (-salii-) were perhaps the most ancient and sacred of all the priesthoods,(1) and dancers (-ludii-, -ludiones-) were indispensable in all public processions, and particularly at funeral solemnities; so that dancing became even in ancient times a common trade. But, wherever the dancers made their appearance, there appeared also the musicians

Page 204

or—which was in the earliest times the same thing—the pipers. They too were never wanting at a sacrifice, at a marriage, or at a funeral; and by the side of the primitive public priesthood of the “leapers” there was ranged, of equal antiquity although of far inferior rank, the guild of the “pipers” (-collegium tibicinum-(2)), whose true character as strolling musicians is evinced by their ancient privilege—maintained even in spite of the strictness of Roman police—of wandering through the streets at their annual festival, wearing masks and full of sweet wine. While dancing thus presents itself as an honourable function and music as one subordinate but still necessary, so that public corporations were instituted for both of them, poetry appears more as a matter incidental and, in some measure, indifferent, whether it may have come into existence on its own account or to serve as an accompaniment to the movements of the dancers.

Religious Chants

The earliest chant, in the view of the Romans, was that which the leaves sang to themselves in the green solitude of the forest. The whispers and pipings of the “favourable spirit” (-faunus-, from -favere-) in the grove were reproduced for men, by those who had the gift of listening to him, in rhythmically measured language (-casmēn-, afterwards -carmen-, from -canere-). Of a kindred nature to these soothsaying songs of inspired men and women (-vates-) were the incantations properly so called, the formulae for conjuring away diseases and other troubles, and the evil spells by which they prevented rain and called down lightning or even enticed the seed from one field to another; only in these instances, probably from the outset, formulae of mere sounds appear side by side with formulae of words.(3) More firmly rooted in tradition and equally ancient were the religious litanies which were sung and danced by the Salii and other priesthoods; the only one of which that has come down to us, a dance-chant of the Arval Brethren in honour of Mars probably composed to be sung in alternate parts, deserves a place here.

-Enos, Lases, iuvate!
Ne velue rue, Marmar, sins incurrere in pleores!
Satur fu, fere Mars! limen sali! sta! berber!
Semunis alternei advocapit conctos!
Enos, Marmar, iuvato!
Triumpe!-

Which may be thus interpreted:

To the gods:
-Nos, Lares, iuvate!
Ne veluem (= malam luem) ruem (= ruinam), Mamers,

sinas incurrere in plures!
Satur esto, fere Mars!

To the individual brethren:
In limen insili! sta! verbera (limen?)!

To all the brethren:
Semones alterni advocate cunctos!

To the god:
Nos, Mamers, iuvato!

To the individual brethren:
Tripudia!-(4)

The Latin of this chant and of kindred fragments of the Salian songs, which were regarded even by the philologues of the Augustan age as the oldest documents of their mother-tongue, is related to the Latin of the Twelve Tables somewhat as the language of the Nibelungen is related to the language of Luther; and we may perhaps compare these venerable litanies, as respects both language and contents, with the Indian Vedas.

Page 205

Panegyrics and Lampoons

Lyrical panegyrics and lampoons belonged to a later epoch. We might infer from the national character of the Italians that satirical songs must have abounded in Latium in ancient times, even if their prevalence had not been attested by the very ancient measures of police directed against them. But the panegyric chants became of more importance. When a burgess was borne to burial, the bier was followed by a female relative or friend, who, accompanied by a piper, sang his dirge (-nenia-). In like manner at banquets boys, who according to the fashion of those days attended their fathers even at feasts out of their own houses, sang by turns songs in praise of their ancestors, sometimes to the pipe, sometimes simply reciting them without accompaniment (-assa voce canere-). The custom of men singing in succession at banquets was presumably borrowed from the Greeks, and that not till a later age. We know no further particulars of these ancestral lays; but it is self-evident that they must have attempted description and narration and thus have developed, along with and out of the lyrical element, the features of epic poetry.

The Masked Farce

Other elements of poetry were called into action in the primitive popular carnival, the comic dance or -satura-,⁽⁵⁾ which beyond doubt reached back to a period anterior to the separation of the stocks. On such occasions song would never be wanting; and the circumstances under which such pastimes were exhibited, chiefly at public festivals and marriages, as well as the mainly practical shape which they certainly assumed, naturally suggested that several dancers, or sets of dancers, should take up reciprocal parts; so that the singing thus came to be associated with a species of acting, which of course was chiefly of a comical and often of a licentious character. In this way there arose not merely alternative chants, such as afterwards went by the name of Fescennine songs, but also the elements of a popular comedy—which were in this instance planted in a soil admirably adapted for their growth, as an acute sense of the outward and the comic, and a delight in gesticulation and masquerade have ever been leading traits of Italian character.

No remains have been preserved of these -incunabula- of the Roman epos and drama. That the ancestral lays were traditional is self-evident, and is abundantly demonstrated by the fact that they were regularly recited by children; but even in the time of Cato the Elder they had completely passed into oblivion. The comedies again, if it be allowable so to name them, were at this period and long afterwards altogether improvised. Consequently nothing of this popular poetry and popular melody could be handed down but the measure, the accompaniment of music and choral dancing, and perhaps the masks.

Page 206

Metre

Whether what we call metre existed in the earlier times is doubtful; the litany of the Arval Brethren scarcely accommodates itself to an outwardly fixed metrical system, and presents to us rather the appearance of an animated recitation. On the other hand we find in subsequent times a very ancient rhythm, the so-called Saturnian(6) or Faunian metre, which is foreign to the Greeks, and may be conjectured to have arisen contemporaneously with the oldest Latin popular poetry. The following poem, belonging, it is true, to a far later age, may give an idea of it:—

Quod re sua difeidents—aspere afleicta

Parens timens heic vovit—voto hoc soluto

Decuma facta poloucta—leibereis lubentis

Donu danunt__hercolei—maxsume—mereto

Semol te orant se voti—crebro con__demnes.

— — ' — — ' — — ' — — ^ / — — ' — — ' — — ' — ^

That which, misfortune dreading—sharply to afflict him, An anxious parent vowed here,
—when his wish was granted, A sacred tenth for banquet—gladly give his children to
Hercules a tribute—most of all deserving; And now they thee beseech, that—often thou
wouldst hear them.

Panegyrics as well as comic songs appear to have been uniformly sung in Saturnian metre, of course to the pipe, and presumably in such a way that the -caesura- in particular in each line was strongly marked; and in alternate singing the second singer probably took up the verse at this point. The Saturnian measure is, like every other occurring in Roman and Greek antiquity, based on quantity; but of all the antique metres perhaps it is the least thoroughly elaborated, for besides many other liberties it allows itself the greatest license in omitting the short syllables, and it is at the same time the most imperfect in construction, for these iambic and trochaic half-lines opposed to each other were but little fitted to develop a rhythmical structure adequate for the purposes of the higher poetry.

Melody

The fundamental elements of the national music and choral dancing in Latium, which must likewise have been established during this period, are buried for us in oblivion; except that the Latin pipe is reported to have been a short and slender instrument, provided with only four holes, and originally, as the name shows, made out of the light thighbone of some animal.

Masks

Page 207

Lastly, the masks used in after times for the standing characters of the Latin popular comedy or the Atellana, as it was called: Maccus the harlequin, Bucco the glutton, Pappus the good papa, and the wise Dossennus—masks which have been cleverly and strikingly compared to the two servants, the -pantalon- and the -dottore-, in the Italian comedy of Pulcinello—already belonged to the earliest Latin popular art. That they did so cannot of course be strictly proved; but as the use of masks for the face in Latium in the case of the national drama was of immemorial antiquity, while the Greek drama in Rome did not adopt them for a century after its first establishment, as, moreover, those Atellane masks were of decidedly Italian origin, and as, in fine, the origination as well as the execution of improvised pieces cannot well be conceived apart from fixed masks assigning once for all to the player his proper position throughout the piece, we must associate fixed masks with the rudiments of the Roman drama, or rather regard them as constituting those rudiments themselves.

Earliest Hellenic Influences

If our information respecting the earliest indigenous culture and art of Latium is so scanty, it may easily be conceived that our knowledge will be still scantier regarding the earliest impulses imparted in this respect to the Romans from without. In a certain sense we may include under this head their becoming acquainted with foreign languages, particularly the Greek. To this latter language, of course, the Latins generally were strangers, as was shown by their enactment in respect to the Sibylline oracles;(7) but an acquaintance with it must have been not at all uncommon in the case of merchants. The same may be affirmed of the knowledge of reading and writing, closely connected as it was with the knowledge of Greek.(8) The culture of the ancient world, however, was not based either on the knowledge of foreign languages or on elementary technical accomplishments. An influence more important than any thus imparted was exercised over the development of Latium by the elements of the fine arts, which were already in very early times received from the Hellenes. For it was the Hellenes alone, and not the Phoenicians or the Etruscans, that in this respect exercised an influence on the Italians. We nowhere find among the latter any stimulus of the fine arts which can be referred to Carthage or Caere, and the Phoenician and Etruscan forms of civilization may be in general perhaps classed with those that are hybrid, and for that reason not further productive.(9) But the influence of Greece did not fail to bear fruit. The Greek seven-stringed lyre, the “strings” (-fides-, from —sphidei—, gut; also -barbitus-, —barbitos—), was not like the pipe indigenous in Latium, and was always regarded there as an instrument of foreign origin; but the early period at which it gained a

Page 208

footing is demonstrated partly by the barbarous mutilation of its Greek name, partly by its being employed even in ritual.(10) That some of the legendary stores of the Greeks during this period found their way into Latium, is shown by the ready reception of Greek works of sculpture with their representations based so thoroughly upon the poetical treasures of the nation; and the old Latin barbarous conversions of Persephone into Prosepna, Bellerophontes into Melerpanta, Kyklops into Cocles, Laomedon into Alumentus, Ganymedes into Catamitus, Neilos into Melus, Semele into Stimula, enable us to perceive at how remote a period such stories had been heard and repeated by the Latins. Lastly and especially, the Roman chief festival or festival of the city (-ludi maximi-, -Romani-) must in all probability have owed, if not its origin, at any rate its later arrangements to Greek influence. It was an extraordinary thanksgiving festival celebrated in honour of the Capitoline Jupiter and the gods dwelling along with him, ordinarily in pursuance of a vow made by the general before battle, and therefore usually observed on the return home of the burgess-force in autumn. A festal procession proceeded toward the Circus staked off between the Palatine and Aventine, and furnished with an arena and places for spectators; in front the whole boys of Rome, arranged according to the divisions of the burgess-force, on horseback and on foot; then the champions and the groups of dancers which we have described above, each with their own music; thereafter the servants of the gods with vessels of frankincense and other sacred utensils; lastly the biers with the images of the gods themselves. The spectacle itself was the counterpart of war as it was waged in primitive times, a contest on chariots, on horseback, and on foot. First there ran the war-chariots, each of which carried in Homeric fashion a charioteer and a combatant; then the combatants who had leaped off; then the horsemen, each of whom appeared after the Roman style of fighting with a horse which he rode and another led by the hand (-desultor-); lastly, the champions on foot, naked to the girdle round their loins, measured their powers in racing, wrestling, and boxing. In each species of contest there was but one competition, and that between not more than two competitors. A chaplet rewarded the victor, and the honour in which the simple branch which formed the wreath was held is shown by the law permitting it to be laid on the bier of the victor when he died. The festival thus lasted only one day, and the competitions probably still left sufficient time on that day for the carnival proper, at which the groups of dancers may have displayed their art and above all exhibited their farces; and doubtless other representations also, such as competitions in juvenile horsemanship, found a place.(11) The honours won in real war also played their part in this festival; the brave warrior exhibited on this day the equipments of the antagonist whom he had slain, and was decorated with a chaplet by the grateful community just as was the victor in the competition.

Page 209

Such was the nature of the Roman festival of victory or city-festival; and the other public festivities of Rome may be conceived to have been of a similar character, although less ample in point of resources. At the celebration of a public funeral dancers regularly bore a part, and along with them, if there was to be any further exhibition, horse-racers; in that case the burgesses were specially invited beforehand to the funeral by the public crier.

But this city-festival, so intimately bound up with the manners and exercises of the Romans, coincides in all essentials with the Hellenic national festivals: more especially in the fundamental idea of combining a religious solemnity and a competition in warlike sports; in the selection of the several exercises, which at the Olympic festival, according to Pindar's testimony, consisted from the first in running, wrestling, boxing, chariot-racing, and throwing the spear and stone; in the nature of the prize of victory, which in Rome as well as in the Greek national festivals was a chaplet, and in the one case as well as in the other was assigned not to the charioteer, but to the owner of the team; and lastly in introducing the feats and rewards of general patriotism in connection with the general national festival. This agreement cannot have been accidental, but must have been either a remnant of the primitive connection between the peoples, or a result of the earliest international intercourse; and the probabilities preponderate in favour of the latter hypothesis. The city-festival, in the form in which we are acquainted with it, was not one of the oldest institutions of Rome, for the Circus itself was only laid out in the later regal period;(12) and just as the reform of the constitution then took place under Greek influence,(13) the city-festival may have been at the same time so far transformed as to combine Greek races with, and eventually to a certain extent to substitute them for, an older mode of amusement—the “leap” (-trumpus-, (14)), and possibly swinging, which was a primitive Italian custom and long continued in use at the festival on the Alban mount. Moreover, while there is some trace of the use of the war-chariot in actual warfare in Hellas, no such trace exists in Latium. Lastly, the Greek term —stadion— (Doric —spadion—) was at a very early period transferred to the Latin language, retaining its signification, as -spatium-; and there exists even an express statement that the Romans derived their horse and chariot races from the people of Thurii, although, it is true, another account derives them from Etruria. It thus appears that, in addition to the impulses imparted by the Hellenes in music and poetry, the Romans were indebted to them for the fruitful idea of gymnastic competitions.

Character of Poetry and of Education in Latium

Page 210

Thus there not only existed in Latium the same fundamental elements out of which Hellenic culture and art grew, but Hellenic culture and art themselves exercised a powerful influence over Latium in very early times. Not only did the Latins possess the elements of gymnastic training, in so far as the Roman boy learned like every farmer's son to manage horses and waggon and to handle the hunting-spear, and as in Rome every burgess was at the same time a soldier; but the art of dancing was from the first an object of public care, and a powerful impulse was further given to such culture at an early period by the introduction of the Hellenic games. The lyrical poetry and tragedy of Hellas grew out of songs similar to the festal lays of Rome; the ancestral lay contained the germs of epos, the masked farce the germs of comedy; and in this field also Grecian influences were not wanting.

In such circumstances it is the more remarkable that these germs either did not spring up at all, or were soon arrested in their growth. The bodily training of the Latin youth continued to be solid and substantial, but far removed from the idea of artistic culture for the body, such as was the aim of Hellenic gymnastics. The public games of the Hellenes when introduced into Italy, changed not so much their formal rules as their essential character. While they were intended to be competitions of burgesses and beyond doubt were so at first in Rome, they became contests of professional riders and professional boxers, and, while the proof of free and Hellenic descent formed the first condition for participating in the Greek festal games, those of Rome soon passed into the hands of freedmen and foreigners and even of persons not free at all. Consequently the circle of fellow-competitors became converted into a public of spectators, and the chaplet of the victorious champion, which has been with justice called the badge of Hellas, was afterwards hardly ever mentioned in Latium.

A similar fate befel poetry and her sisters. The Greeks and Germans alone possess a fountain of song that wells up spontaneously; from the golden vase of the Muses only a few drops have fallen on the green soil of Italy. There was no formation of legend in the strict sense there. The Italian gods were abstractions and remained such; they never became elevated into or, as some may prefer to say, obscured under, a true personal shape. In like manner men, even the greatest and noblest, remained in the view of the Italian without exception mortal, and were not, as in the longing recollection and affectionately cherished tradition of Greece, elevated in the conception of the multitude into god-like heroes. But above all no development of national poetry took place in Latium. It is the deepest and noblest effect of the fine arts and above all of poetry, that they break down the barriers of civil communities and create out of tribes a nation and out of the nations a world.

Page 211

As in the present day by means of our cosmopolitan literature the distinctions of civilized nations are done away, so Greek poetic art transformed the narrow and egoistic sense of tribal relationship into the consciousness of Hellenic nationality, and this again into the consciousness of a common humanity. But in Latium nothing similar occurred. There might be poets in Alba and in Rome, but there arose no Latin epos, nor even—what were still more conceivable—a catechism for the Latin farmer of a kind similar to the “Works and Days” of Hesiod. The Latin federal festival might well have become a national festival of the fine arts, like the Olympian and Isthmian games of the Greeks. A cycle of legends might well have gathered around the fall of Alba, such as was woven around the conquest of Ilion, and every community and every noble clan of Latium might have discovered in it, or imported into it, the story of its own origin. But neither of these results took place, and Italy remained without national poetry or art.

The inference which of necessity follows from these facts, that the development of the fine arts in Latium was rather a shrivelling up than an expanding into bloom, is confirmed in a manner even now not to be mistaken by tradition. The beginnings of poetry everywhere, perhaps, belong rather to women than to men; the spell of incantation and the chant for the dead pertain pre-eminently to the former, and not without reason the spirits of song, the Casmene or Camene and the Carmentis of Latium, like the Muses of Hellas, were conceived as feminine. But the time came in Hellas, when the poet relieved the songstress and Apollo took his place at the head of the Muses. In Latium there was no national god of song, and the older Latin language had no designation for the poet.⁽¹⁵⁾ The power of song emerging there was out of all proportion weaker, and was rapidly arrested in its growth. The exercise of the fine arts was there early restricted, partly to women and children, partly to incorporated or unincorporated tradesmen. We have already mentioned that funeral chants were sung by women and banquet-lays by boys; the religious litanies also were chiefly executed by children. The musicians formed an incorporated, the dancers and the wailing women (-*praeeficae*-) unincorporated, trades. While dancing, music, and singing remained constantly in Greece—as they were originally also in Latium—reputable employments redounding to the honour of the burgess and of the community to which he belonged, in Latium the better portion of the burgesses drew more and more aloof from these vain arts, and that the more decidedly, in proportion as art came to be more publicly exhibited and more thoroughly penetrated by the quickening impulses derived from other lands. The use of the native pipe was sanctioned, but the lyre remained despised; and while the national amusement of masks was allowed, the foreign amusements of the -*palaestra*- were not

Page 212

only regarded with indifference, but esteemed disgraceful. While the fine arts in Greece became more and more the common property of the Hellenes individually and collectively and thereby became the means of developing a universal culture, they gradually disappeared in Latium from the thoughts and feelings of the people; and, as they degenerated into utterly insignificant handicrafts, the idea of a general national culture to be communicated to youth never suggested itself at all. The education of youth remained entirely confined within the limits of the narrowest domesticity. The boy never left his father's side, and accompanied him not only to the field with the plough and the sickle, but also to the house of a friend or to the council-hall, when his father was invited as a guest or summoned to the senate. This domestic education was well adapted to preserve man wholly for the household and wholly for the state. The permanent intercommunion of life between father and son, and the mutual reverence felt by adolescence for ripened manhood and by the mature man for the innocence of youth, lay at the root of the steadfastness of the domestic and political traditions, of the closeness of the family bond, and in general of the grave earnestness (-gravitas-) and character of moral worth in Roman life. This mode of educating youth was in truth one of those institutions of homely and almost unconscious wisdom, which are as simple as they are profound. But amidst the admiration which it awakens we may not overlook the fact that it could only be carried out, and was only carried out, by the sacrifice of true individual culture and by a complete renunciation of the equally charming and perilous gifts of the Muses.

Dance, Music, and Song among the Sabellians and Etruscans

Regarding the development of the fine arts among the Etruscans and Sabellians our knowledge is little better than none.⁽¹⁶⁾ We can only notice the fact that in Etruria the dancers (-histri-, -histriones-) and the pipe-players (-subulones-) early made a trade of their art, probably earlier even than in Rome, and exhibited themselves in public not only at home, but also in Rome for small remuneration and less honour. It is a circumstance more remarkable that at the Etruscan national festival, in the exhibition of which the whole twelve cities were represented by a federal priest, games were given like those of the Roman city-festival; we are, however, no longer in a position to answer the question which it suggests, how far the Etruscans were more successful than the Latins in attaining a national form of fine art beyond that of the individual communities. On the other hand a foundation probably was laid in Etruria, even in early times, for that insipid accumulation of learned lumber, particularly of a theological and astrological nature, by virtue of which afterwards, when amidst the general decay antiquarian dilettantism began to flourish, the Tuscans

Page 213

divided with the Jews, Chaldeans, and Egyptians the honour of being admired as primitive sources of divine wisdom. We know still less, if possible, of Sabellian art; but that of course by no means warrants the inference that it was inferior to that of the neighbouring stocks. On the contrary, it may be conjectured from what we otherwise know of the character of the three chief races of Italy, that in artistic gifts the Samnites approached nearest to the Hellenes and the Etruscans were farthest removed from them; and a sort of confirmation of this hypothesis is furnished by the fact, that the most gifted and most original of the Roman poets, such as Naevius, Ennius, Lucilius, and Horace, belonged to the Samnite lands, whereas Etruria has almost no representatives in Roman literature except the Arretine Maecenas, the most insufferable of all heart-withered and affected(17) court-poets, and the Volaterran Persius, the true ideal of a conceited and languid, poetry-smitten, youth.

Earliest Italian Architecture

The elements of architecture were, as has been already indicated, a primitive common possession of the stocks. The dwelling-house constitutes the first attempt of structural art; and it was the same among Greeks and Italians. Built of wood, and covered with a pointed roof of straw or shingles it formed a square dwelling-chamber, which let out the smoke and let in the light by an opening in the roof corresponding with a hole for carrying off the rain in the ground (-cavum aedium-). Under this "black roof" (-atrium-) the meals were prepared and consumed; there the household gods were worshipped, and the marriage bed and the bier were set out; there the husband received his guests, and the wife sat spinning amid the circle of her maidens. The house had no porch, unless we take as such the uncovered space between the house door and the street, which obtained its name -vestibulum-, i. e. dressing-place, from the circumstance that the Romans were in the habit of going about within doors in their tunics, and only wrapped the toga around them when they went abroad. There was, moreover, no division of apartments except that sleeping and store closets might be provided around the dwelling-room; and still less were there stairs, or stories placed one above another.

Earliest Hellenic Influence

Whether, or to what extent, a national Italian architecture arose out of these beginnings can scarcely be determined, for in this field Greek influence, even in the earliest times, had a very powerful effect and almost wholly overgrew such national attempts as possibly had preceded it. The very oldest Italian architecture with which we are acquainted is not much less under the influence of that of Greece than the architecture of the Augustan age. The primitive tombs of Caere and Alsium, and probably the oldest one also

Page 214

of those recently discovered at Praeneste, have been, exactly like the —thesauroi—of Orchomenos and Mycenae, roofed over with courses of stone placed one above another, gradually overlapping, and closed by a large stone cover. A very ancient building at the city wall of Tusculum was roofed in the same way, and so was originally the well-house (-tullianum-) at the foot of the Capitol, till the top was pulled down to make room for another building. The gates constructed on the same system are entirely similar in Arpinum and in Mycenae. The tunnel which drains the Alban lake⁽¹⁸⁾ presents the greatest resemblance to that of lake Copais. What are called Cyclopean ring-walls frequently occur in Italy, especially in Etruria, Umbria, Latium, and Sabina, and decidedly belong in point of design to the most ancient buildings of Italy, although the greater portion of those now extant were probably not executed till a much later age, several of them certainly not till the seventh century of the city. They are, just like those of Greece, sometimes quite roughly formed of large unwrought blocks of rock with smaller stones inserted between them, sometimes disposed in square horizontal courses,⁽¹⁹⁾ sometimes composed of polygonal dressed blocks fitting into each other. The selection of one or other of these systems was doubtless ordinarily determined by the material, and accordingly the polygonal masonry does not occur in Rome, where in the most ancient times tufo alone was employed for building. The resemblance in the case of the two former and simpler styles may perhaps be traceable to the similarity of the materials employed and of the object in view in building; but it can hardly be deemed accidental that the artistic polygonal wall-masonry, and the gate with the path leading up to it universally bending to the left and so exposing the unshielded right side of the assailant to the defenders, belong to the Italian fortresses as well as to the Greek. The facts are significant that in that portion of Italy which was not reduced to subjection by the Hellenes but yet was in lively intercourse with them, the true polygonal masonry was at home, and it is found in Etruria only at Pyrgi and at the towns, not very far distant from it, of Cosa and Saturnia; as the design of the walls of Pyrgi, especially when we take into account the significant name ("towers"), may just as certainly be ascribed to the Greeks as that of the walls of Tiryns, in them most probably there still stands before our eyes one of the models from which the Italians learned how to build their walls. The temple in fine, which in the period of the empire was called the Tuscanic and was regarded as a kind of style co-ordinate with the various Greek temple-structures, not only generally resembled the Greek temple in being an enclosed space (-cello-) usually quadrangular, over which walls and columns raised aloft a sloping roof, but was also in details, especially in the column itself and its

Page 215

architectural features, thoroughly dependent on the Greek system. It is in accordance with all these facts probable, as it is credible of itself, that Italian architecture previous to its contact with the Hellenes was confined to wooden huts, abattis, and mounds of earth and stones, and that construction in stone was only adopted in consequence of the example and the better tools of the Greeks. It is scarcely to be doubted that the Italians first learned from them the use of iron, and derived from them the preparation of mortar (-cal[e]x-, -calecare-, from —chaliz—), the machine (-machina-, —meichanei—), the measuring-rod (-groma-, a corruption from —gnomon—, —gnoma—), and the artificial latticework (-clathri-, —kleithron—). Accordingly we can scarcely speak of an architecture peculiarly Italian. Yet in the woodwork of the Italian dwelling-house—alongside of alterations produced by Greek influence—various peculiarities may have been retained or even for the first time developed, and these again may have exercised a reflex influence on the building of the Italian temples. The architectural development of the house proceeded in Italy from the Etruscans. The Latin and even the Sabellian still adhered to the hereditary wooden hut and to the good old custom of assigning to the god or spirit not a consecrated dwelling, but only a consecrated space, while the Etruscan had already begun artistically to transform his dwelling-house, and to erect after the model of the dwelling-house of man a temple also for the god and a sepulchral chamber for the spirit. That the advance to such luxurious structures in Latium first took place under Etruscan influence, is proved by the designation of the oldest style of temple architecture and of the oldest style of house architecture respectively as Tuscanic.(20) As concerns the character of this transference, the Grecian temple probably imitated the general outlines of the tent or dwelling-house; but it was essentially built of hewn stone and covered with tiles, and the nature of the stone and the baked clay suggested to the Greek the laws of necessity and beauty. The Etruscan on the other hand remained a stranger to the strict Greek distinction between the dwelling of man necessarily erected of wood and the dwelling of the gods necessarily formed of stone. The peculiar characteristics of the Tuscan temple—the outline approaching nearer to a square, the higher gable, the greater breadth of the intervals between the columns, above all, the increased inclination of the roof and the singular projection of the roof-corbels beyond the supporting columns—all arose out of the greater approximation of the temple to the dwelling-house, and out of the peculiarities of wooden architecture.

Plastic Art in Italy

Page 216

The plastic and delineative arts are more recent than architecture; the house must be built before any attempt is made to decorate gable and walls. It is not probable that these arts really gained a place in Italy during the regal period of Rome; it was only in Etruria, where commerce and piracy early gave rise to a great concentration of riches, that art or handicraft—if the term be preferred—obtained a footing in the earliest times. Greek art, when it acted on Etruria, was still, as its copy shows, at a very primitive stage, and the Etruscans may have learned from the Greeks the art of working in clay and metal at a period not much later than that at which they borrowed from them the alphabet. The silver coins of Populonia, almost the only works that can be with any precision assigned to this period, give no very high idea of Etruscan artistic skill as it then stood; yet the best of the Etruscan works in bronze, to which the later critics of art assigned so high a place, may have belonged to this primitive age; and the Etruscan terra-cottas also cannot have been altogether despicable, for the oldest works in baked clay placed in the Roman temples—the statue of the Capitoline Jupiter, and the four-horse chariot on the roof of his temple—were executed in Veii, and the large ornaments of a similar kind placed on the roofs of temples passed generally among the later Romans under the name of “Tuscanic works.”

On the other hand, among the Italians—not among the Sabellian stocks merely, but even among the Latins—native sculpture and design were at this period only coming into existence. The most considerable works of art appear to have been executed abroad. We have just mentioned the statues of clay alleged to have been executed in Veii; and very recent excavations have shown that works in bronze made in Etruria, and furnished with Etruscan inscriptions, circulated in Praeneste at least, if not generally throughout Latium. The statue of Diana in the Romano-Latin federal temple on the Aventine, which was considered the oldest statue of a divinity in Rome,(21) exactly resembled the Massiliot statue of the Ephesian Artemis, and was perhaps manufactured in Velia or Massilia. The guilds, which from ancient times existed in Rome, of potters, coppersmiths, and goldsmiths,(22) are almost the only proofs of the existence of native sculpture and design there; respecting the position of their art it is no longer possible to gain any clear idea.

Artistic Relations and Endowments of the Etruscans and Italians

If we endeavour to obtain historical results from the archives of the tradition and practice of primitive art, it is in the first place manifest that Italian art, like the Italian measures and Italian writing, developed itself not under Phoenician, but exclusively under Hellenic influence. There is not a single one of the aspects of Italian art which has not found its definite model in the art of ancient Greece; and,

Page 217

so far, the legend is fully warranted which traces the manufacture of painted clay figures, beyond doubt the most ancient form of art in Italy, to the three Greek artists, the “moulder,” “fitter,” and “draughtsman,” Eucheir, Diopos, and Eugrammos, although it is more than doubtful whether this art came directly from Corinth or came directly to Tarquinii. There is as little trace of any immediate imitation of oriental models as there is of an independently-developed form of art. The Etruscan lapidaries adhered to the form of the beetle or -scarabaeus-, which was originally Egyptian; but —scarabaei— were also used as models for carving in Greece in very early times (e. g. such a beetle-stone, with a very ancient Greek inscription, has been found in Aegina), and therefore they may very well have come to the Etruscans through the Greeks. The Italians may have bought from the Phoenician; they learned only from the Greek.

To the further question, from what Greek stock the Etruscans in the first instance received their art-models, a categorical answer cannot be given; yet relations of a remarkable kind subsist between the Etruscan and the oldest Attic art. The three forms of art, which were practised in Etruria at least in after times very extensively, but in Greece only to an extent very limited, tomb-painting, mirror-designing, and graving on stone, have been hitherto met with on Grecian soil only in Athens and Aegina. The Tuscan temple does not correspond exactly either to the Doric or to the Ionic; but in the more important points of distinction, in the course of columns carried round the -cella-, as well as in the placing of a separate pedestal under each particular column, the Etruscan style follows the more recent Ionic; and it is this same Iono-Attic style of building still pervaded by a Doric element, which in its general design stands nearest of all the Greek styles to the Tuscan. In the case of Latium there is an almost total absence of any certain traces of intercourse bearing on the history of art. If it was—as is indeed almost self-evident—the general relations of traffic and intercourse that determined also the introduction of models in art, it may be assumed with certainty that the Campanian and Sicilian Hellenes were the instructors of Latium in art, as in the alphabet; and the analogy between the Aventine Diana and the Ephesian Artemis is at least not inconsistent with such an hypothesis. Of course the older Etruscan art also served as a model for Latium. As to the Sabellian tribes, if Greek architectural and plastic art reached them at all, it must, like the Greek alphabet, have come to them only through the medium of the more western Italian stocks.

Page 218

If, in conclusion, we are to form a judgment respecting the artistic endowments of the different Italian nations, we already at this stage perceive—what becomes indeed far more obvious in the later stages of the history of art—that while the Etruscans attained to the practice of art at an earlier period and produced more massive and rich workmanship, their works are inferior to those of the Latins and Sabellians in appropriateness and utility no less than in spirit and beauty. This certainly is apparent, in the case of our present epoch, only in architecture. The polygonal wall-masonry, as appropriate to its object as it was beautiful, was frequent in Latium and in the inland country behind it; while in Etruria it was rare, and not even the walls of Caere are constructed of polygonal blocks. Even in the religious prominence—remarkable also as respects the history of art—assigned to the arch(23) and to the bridge(24) in Latium, we may be allowed to perceive, as it were, an anticipation of the future aqueducts and consular highways of Rome. On the other hand, the Etruscans repeated, and at the same time corrupted, the ornamental architecture of the Greeks: for while they transferred the laws established for building in stone to architecture in wood, they displayed no thorough skill of adaptation, and by the lowness of their roof and the wide intervals between their columns gave to their temples, to use the language of an ancient architect, a “heavy, mean, straggling, and clumsy appearance.” The Latins found in the rich stores of Greek art but very little that was congenial to their thoroughly realistic tastes; but what they did adopt they appropriated truly and heartily as their own, and in the development of the polygonal wall-architecture perhaps excelled their instructors. Etruscan art is a remarkable evidence of accomplishments mechanically acquired and mechanically retained, but it is, as little as the Chinese, an evidence even of genial receptivity. As scholars have long since desisted from the attempt to derive Greek art from that of the Etruscans, so they must, with whatever reluctance, make up their minds to transfer the Etruscans from the first to the lowest place in the history of Italian art.

Notes for Book I Chapter XV

1. I. XII. Priests

2. I. XIII. Handicrafts

3. Thus Cato the Elder (de R. R. 160) gives as potent against sprains the formula: -hauat hauat hauat ista pista sista damia bodannaustra-, which was presumably quite as obscure to its inventor as it is to us. Of course, along with these there were also formulae of words; e. g. it was a remedy for gout, to think, while fasting, on some other person, and thrice nine times to utter the words, touching the earth at the same time and spitting:—“I think of thee, mend my feet. Let the earth receive the ill, let health with me dwell” (-terra pestem teneto, salus hie maneto-. Varro de R. R. i. 2, 27).

Page 219

4. Each of the first five lines was repeated thrice, and the call at the close five times. Various points in the interpretation are uncertain, particularly as respects the third line. —The three inscriptions of the clay vase from the Quirinal (p. 277, note) run thus: -iove sat deiuosqoi med mitat nei ted endo gosmis uirgo sied—asted noisi ope toilesiai pakariuois—duenos med faked (=bonus me fecit) enmanom einom dze noine (probably=die noni) med malo statod.—Only individual words admit of being understood with certainty; it is especially noteworthy that forms, which we have hitherto known only as Umbrian and Oscan, like the adjective -pacer-and the particle -einom with the value of -et, here probably meet us withal as old-Latin.

5. I. II. Art

6. The name probably denotes nothing but “the chant-measure,” inasmuch as the -satura- was originally the chant sung at the carnival (*ii. Art*). The god of sowing, -Saeturnus- or -Saiturnus-, afterwards -Saturnus-, received his name from the same root; his feast, the Saturnalia, was certainly a sort of carnival, and it is possible that the farces were originally exhibited chiefly at this feast. But there are no proofs of a relation between the Satura and the Saturnalia, and it may be presumed that the immediate association of the -versus saturnius- with the god Saturn, and the lengthening of the first syllable in connection with that view, belong only to later times.

7. I. XII. Foreign Worships

8. I. XIV. Introduction of Hellenic Alphabets into Italy

9. The statement that “formerly the Roman boys were trained in Etruscan culture, as they were in later times in Greek” (Liv. ix. 36), is quite irreconcilable with the original character of the Roman training of youth, and it is not easy to see what the Roman boys could have learned in Etruria. Even the most zealous modern partizans of Tages-worship will not maintain that the study of the Etruscan language played such a part in Rome then as the learning of French does now with us; that a non-Etruscan should understand anything of the art of the Etruscan -haruspices- was considered, even by those who availed themselves of that art, to be a disgrace or rather an impossibility (Muller, Etr. ii. 4). Perhaps the statement was concocted by the Etruscizing antiquaries of the last age of the republic out of stories of the older annals, aiming at a causal explanation of facts, such as that which makes Mucius Scaevola learn Etruscan when a child for the sake of his conversation with Porsena (Dionysius, v. 28; Plutarch, Poplicola, 17; comp. Dionysius, iii. 70). But there was at any rate an epoch when the dominion of Rome over Italy demanded a certain knowledge of the language of the country on the part of Romans of rank.

Page 220

10. The employment of the lyre in ritual is attested by Cicero *de Orat.* iii. 51, 197; *Tusc.* iv. 2, 4; Dionysius, vii. 72; Appian, *Pun.* 66; and the inscription in Orelli, 2448, comp. 1803. It was likewise used at the -neniae- (Varro *ap. Nonium*, v. -nenia- and -praeficae-). But playing on the lyre remained none the less unbecoming (Scipio *ap. Macrobi.* Sat. ii. 10, *et al.*). The prohibition of music in 639 exempted only the “Latin player on the pipe along with the singer,” not the player on the lyre, and the guests at meals sang only to the pipe (Cato in Cic. *Tusc.* i. 2, 3; iv. 2, 3; Varro *ap. Nonium*, v. -assa voce-; Horace, *Carm.* iv. 15, 30). Quintilian, who asserts the reverse (*Inst.* i. 10, 20), has inaccurately transferred to private banquets what Cicero (*de Orat.* iii. 51) states in reference to the feasts of the gods.

11. The city festival can have only lasted at first for a single day, for in the sixth century it still consisted of four days of scenic and one day of Circensian sports (Ritschl, *Parerga*, i. 313) and it is well known that the scenic amusements were only a subsequent addition. That in each kind of contest there was originally only one competition, follows from Livy, xlv. 9; the running of five-and-twenty pairs of chariots in succession on one day was a subsequent innovation (Varro *ap. Serv. Georg.* iii. 18). That only two chariots—and likewise beyond doubt only two horsemen and two wrestlers—strove for the prize, may be inferred from the circumstance, that at all periods in the Roman chariot-races only as many chariots competed as there were so-called factions; and of these there were originally only two, the white and the red. The horsemanship-competition of patrician youths which belonged to the Circensian games, the so-called Troia, was, as is well known, revived by Caesar; beyond doubt it was connected with the cavalcade of the boy-militia, which Dionysius mentions (vii. 72).

19. Of this character were the Servian walls. They consisted partly of a strengthening of the hill-slopes by facing them with lining-walls as much as 4 metres thick, partly—in the intervals, above all on the Viminal and Quirinal, where from the Esquiline to the Colline gate there was an absence of natural defence—of an earthen mound, which was finished off on the outside by a similar lining-wall. On these lining-walls rested the breastwork. A trench, according to trustworthy statements of the ancients 30 feet deep and 100 feet broad, stretched along in front of the wall, for which the earth was taken from this same trench.—The breastwork has nowhere been preserved; of the lining-walls extensive remains have recently been brought to light. The blocks of tufo composing them are hewn in longish rectangles, on an average of 60 centimetres (= 2 Roman feet) in height and breadth, while the length varies from 70 centimetres to 3 metres, and they are, without application of mortar, laid together in several rows, alternately with the long and with the narrow side outermost.

The portion of the Servian wall near the Viminal gate, discovered in the year 1862 at the Villa Negroni, rests on a foundation of huge blocks of tufo of 3 to 4 metres in height and breadth, on which was then raised the outer wall from blocks of the same material and of the same size as those elsewhere employed in the wall. The earthen rampart piled up behind appears to have had on the upper surface a breadth extending about 13 metres or fully 40 Roman feet, and the whole wall-defence, including the outer wall of freestone, to have had a breadth of as much as 15 metres or 50 Roman feet. The portions formed of peperino blocks, which are bound with iron clamps, have only been added in connection with subsequent labours of repair.—Essentially similar to the Servian walls are those discovered in the Vigna Nussiner, on the slope of the Palatine towards the side of the Capitol, and at other points of the Palatine, which have been declared by Jordan (*Topographic*, ii. 173), probably with reason, to be remnants of the citadel-wall of the Palatine Rome,

20. -Ratio Tuscanica, : cavum aedium Tuscanicum.-

21. When Varro (ap. Augustin. *De Civ. Dei*, iv. 31; comp. Plutarch *Num.* 8) affirms that the Romans for more than one hundred and seventy years worshipped the gods without images, he is evidently thinking of this primitive piece of carving, which, according to the conventional chronology, was dedicated between 176 and 219, and, beyond doubt, was the first statue of the gods, the consecration of which was mentioned in the authorities which Varro had before him. Comp, above, *xiv*.

THE HISTORY OF ROME: BOOK II

From the Abolition of the Monarchy in Rome to the Union of Italy

Preparer's Note

This work contains many literal citations of and references to foreign words, sounds, and alphabetic symbols drawn from many languages, including Gothic and Phoenician, but chiefly Latin and Greek. This English Gutenberg edition, constrained to the characters of 7-bit ASCII code, adopts the following orthographic conventions:

- 1) Except for Greek, all literally cited non-English words that do not refer to texts cited as academic references, words that in the source manuscript appear italicized, are rendered with a single preceding, and a single following dash; thus, -xxxx-.
- 2) Greek words, first transliterated into Roman alphabetic equivalents, are rendered with a preceding and a following double-dash; thus, —xxxx—. Note that in some cases the root word itself is a compound form such as xxx-xxxx, and is rendered as —xxx-xxx—
- 3) Simple unideographic references to vocalic sounds, single letters, or alphabetic diphthongs; and prefixes, suffixes, and syllabic references are represented by a single preceding dash; thus, -x, or -xxx.
- 4) Ideographic references, referring to signs of representation rather than to content, are represented as -"id:xxxx"-. "id:" stands for "ideograph", and indicates that the reader should form a picture based on the following "xxxx"; which may be a single symbol, a word, or an attempt at a picture composed of ASCII characters. For example, —"id:Gamma gamma"— indicates an uppercase Greek gamma-form followed by the form in lowercase. Some such exotic parsing as this is necessary to explain alphabetic development because a single symbol may have been used for a number of sounds in a number of languages, or even for a number of sounds in the same language at different times. Thus, -"id:Gamma gamma" might very well refer to a Phoenician construct that in appearance resembles the form that eventually stabilized as an uppercase Greek "gamma" juxtaposed to one of lowercase. Also, a construct such as —"id:E" indicates a symbol that with ASCII resembles most closely a Roman uppercase "E", but, in fact, is actually drawn more crudely.
- 5) Dr. Mommsen has given his dates in terms of Roman usage, A.U.C.; that is, from the founding of Rome, conventionally taken to be 753 B. C. The preparer of this document, has appended to the end of this combined text (Books I-V) a table of conversion between the two systems.

Polybius.

CHAPTER I

Change of the Constitution—
Limitation of the Power of the Magistrate

Political and Social Distinctions in Rome

The strict conception of the unity and omnipotence of the state in all matters pertaining to it, which was the central principle of the Italian constitutions, placed in the hands of the single president nominated for life a formidable power, which was felt doubtless by the enemies of the land, but was not less heavily felt by its citizens. Abuse and oppression could not fail to ensue, and, as a necessary consequence, efforts were made to lessen that power. It was, however, the grand distinction of the endeavours after reform and the revolutions in Rome, that there was no attempt either to impose limitations on the community as such or even to deprive it of corresponding organs of expression—that there never was any endeavour to assert the so-called natural rights of the individual in contradistinction to the community—that, on the contrary, the attack

was wholly directed against the form in which the community was represented. From the times of the Tarquins down to those of the Gracchi the cry of the party of progress in Rome was not for limitation of the power of the state, but for limitation of the power of the magistrates: nor amidst that cry was the truth ever forgotten, that the people ought not to govern, but to be governed.

This struggle was carried on within the burgess-body. Side by side with it another movement developed itself—the cry of the non-burgesses for equality of political privileges. Under this head are included the agitations of the plebeians, the Latins, the Italians, and the freedmen, all of whom—whether they may have borne the name of burgesses, as did the plebeians and the freedmen, or not, as was the case with the Latins and Italians—were destitute of, and desired, political equality.

Page 224

A third distinction was one of a still more general nature; the distinction between the wealthy and the poor, especially such as had been dispossessed or were endangered in possession. The legal and political relations of Rome led to the rise of a numerous class of farmers—partly small proprietors who were dependent on the mercy of the capitalist, partly small temporary lessees who were dependent on the mercy of the landlord—and in many instances deprived individuals as well as whole communities of the lands which they held, without affecting their personal freedom. By these means the agricultural proletariat became at an early period so powerful as to have a material influence on the destinies of the community. The urban proletariat did not acquire political importance till a much later epoch.

On these distinctions hinged the internal history of Rome, and, as may be presumed, not less the history—totally lost to us—of the other Italian communities. The political movement within the fully-privileged burgess-body, the warfare between the excluded and excluding classes, and the social conflicts between the possessors and the non-possessors of land—variously as they crossed and interlaced, and singular as were the alliances they often produced—were nevertheless essentially and fundamentally distinct.

Abolition of the Life-Presidency of the Community

As the Servian reform, which placed the —*metoikos*— on a footing of equality in a military point of view with the burgess, appears to have originated from considerations of an administrative nature rather than from any political party-tendency, we may assume that the first of the movements which led to internal crises and changes of the constitution was that which sought to limit the magistracy. The earliest achievement of this, the most ancient opposition in Rome, consisted in the abolition of the life-tenure of the presidency of the community; in other words, in the abolition of the monarchy. How necessarily this was the result of the natural development of things, is most strikingly demonstrated by the fact, that the same change of constitution took place in an analogous manner through the whole circuit of the Italo-Grecian world. Not only in Rome, but likewise among the other Latins as well as among the Sabellians, Etruscans, and Apulians—and generally, in all the Italian communities, just as in those of Greece—we find the rulers for life of an earlier epoch superseded in after times by annual magistrates. In the case of the Lucanian canton there is evidence that it had a democratic government in time of peace, and it was only in the event of war that the magistrates appointed a king, that is, an official similar to the Roman dictator. The Sabellian civic communities, such as those of Capua and Pompeii, in like manner were in later times governed by a “community-manager” (-*medix tuticus*-) changed from year to year, and we may assume that similar institutions existed among

Page 225

the other national and civic communities of Italy. In this light the reasons which led to the substitution of consuls for kings in Rome need no explanation. The organism of the ancient Greek and Italian polity developed of itself by a sort of natural necessity the limitation of the life-presidency to a shortened, and for the most part an annual, term. Simple, however, as was the cause of this change, it might be brought about in various ways; a resolution might be adopted on the death of one life-ruler not to elect another—a course which the Roman senate is said to have attempted after the death of Romulus; or the ruler might voluntarily abdicate, as is alleged to have been the intention of king Servius Tullius; or the people might rise in rebellion against a tyrannical ruler, and expel him.

Expulsion of the Tarquins from Rome

It was in this latter way that the monarchy was terminated in Rome. For however much the history of the expulsion of the last Tarquinius, “the proud,” may have been interwoven with anecdotes and spun out into a romance, it is not in its leading outlines to be called in question. Tradition credibly enough indicates as the causes of the revolt, that the king neglected to consult the senate and to complete its numbers; that he pronounced sentences of capital punishment and confiscation without advising with his counsellors; that he accumulated immense stores of grain in his granaries, and exacted from the burgesses military labour and task-work beyond what was due. The exasperation of the people is attested by the formal vow which they made man by man for themselves and for their posterity that thenceforth they would never tolerate a king; by the blind hatred with which the name of king was ever afterwards regarded in Rome; and above all by the enactment that the “king for offering sacrifice” (-rex sacrorum- or -sacrificulus-)—whom they considered it their duty to create that the gods might not miss their accustomed mediator—should be disqualified from holding any further office, so that this man became the foremost indeed, but also the most powerless in the Roman commonwealth. Along with the last king all the members of his clan were banished—a proof how close at that time gentile ties still were. The Tarquini thereupon transferred themselves to Caere, perhaps their ancient home,⁽¹⁾ where their family tomb has recently been discovered. In the room of the one president holding office for life two annual rulers were now placed at the head of the Roman community.

This is all that can be looked upon as historically certain in reference to this important event.⁽²⁾ It is conceivable that in a great community with extensive dominion like the Roman the royal power, particularly if it had been in the same family for several generations, would be more capable of resistance, and the struggle would thus be keener, than in the smaller states; but there is no certain indication of any interference

Page 226

by foreign states in the struggle. The great war with Etruria—which possibly, moreover, has been placed so close upon the expulsion of the Tarquins only in consequence of chronological confusion in the Roman annals—cannot be regarded as an intervention of Etruria in favour of a countryman who had been injured in Rome, for the very sufficient reason that the Etruscans notwithstanding their complete victory neither restored the Roman monarchy, nor even brought back the Tarquinian family.

Powers of the Consuls

If we are left in ignorance of the historical connections of this important event, we are fortunately in possession of clearer light as to the nature of the change which was made in the constitution. The royal power was by no means abolished, as is shown by the very fact that, when a vacancy occurred afterwards as before, an “interim king” (-interrex-) was nominated. The one life-king was simply replaced by two year-kings, who called themselves generals (-praetores-), or judges (-iudices-), or merely colleagues (consules).(3) The principles of collegiate tenure and of annual duration are those which distinguish the republic from the monarchy, and they first meet us here.

Collegiate Arrangement

The collegiate principle, from which the third and subsequently most current name of the annual kings was derived, assumed in their case an altogether peculiar form. The supreme power was not entrusted to the two magistrates conjointly, but each consul possessed and exercised it for himself as fully and wholly as it had been possessed and exercised by the king. This was carried so far that, instead of one of the two colleagues undertaking perhaps the administration of justice, and the other the command of the army, they both administered justice simultaneously in the city just as they both set out together to the army; in case of collision the matter was decided by a rotation measured by months or days. A certain partition of functions withal, at least in the supreme military command, might doubtless take place from the outset—the one consul for example taking the field against the Aequi, and the other against the Volsci—but it had in no wise binding force, and each of the colleagues was legally at liberty to interfere at any time in the province of the other. When, therefore, supreme power confronted supreme power and the one colleague forbade what the other enjoined, the consular commands neutralized each other. This peculiarly Latin, if not peculiarly Roman, institution of co-ordinate supreme authorities—which in the Roman commonwealth on the whole approved itself as practicable, but to which it will be difficult to find a parallel in any other considerable state—manifestly sprang out of the endeavour to retain the regal power in legally undiminished fulness. They were thus led not to break up the royal office into parts or to transfer it from an individual to a college, but simply to double it and thereby, if necessary, to neutralize it through its own action.

Page 227

Term of Office

As regards the termination of their tenure of office, the earlier -interregnum- of five days furnished a legal precedent. The ordinary presidents of the community were bound not to remain in office longer than a year reckoned from the day of their entering on their functions;(4) and they ceased -de jure- to be magistrates upon the expiry of the year, just as the interrex on the expiry of the five days. Through this set termination of the supreme office the practical irresponsibility of the king was lost in the case of the consul. It is true that the king was always in the Roman commonwealth subject, and not superior, to the law; but, as according to the Roman view the supreme judge could not be prosecuted at his own bar, the king might doubtless have committed a crime, but there was for him no tribunal and no punishment. The consul, again, if he had committed murder or treason, was protected by his office, but only so long as it lasted; on his retirement he was liable to the ordinary penal jurisdiction like any other burgess.

To these leading changes, affecting the principles of the constitution, other restrictions were added of a subordinate and more external character, some of which nevertheless produced a deep effect. The privilege of the king to have his fields tilled by task-work of the burgesses, and the special relation of clientship in which the —metoeci— as a body must have stood to the king, ceased of themselves with the life tenure of the office.

Right of Appeal

Hitherto in criminal processes as well as in fines and corporal punishments it had been the province of the king not only to investigate and decide the cause, but also to decide whether the person found guilty should or should not be allowed to appeal for pardon. The Valerian law now (in 245) enacted that the consul must allow the appeal of the condemned, where sentence of capital or corporal punishment had been pronounced otherwise than by martial law—a regulation which by a later law (of uncertain date, but passed before 303) was extended to heavy fines. In token of this right of appeal, when the consul appeared in the capacity of judge and not of general, the consular lictors laid aside the axes which they had previously carried by virtue of the penal jurisdiction belonging to their master. The law however threatened the magistrate, who did not allow due course to the -provocatio-, with no other penalty than infamy—which, as matters then stood, was essentially nothing but a moral stain, and at the utmost only had the effect of disqualifying the infamous person from giving testimony. Here too the course followed was based on the same view, that it was in law impossible to diminish the old regal powers, and that the checks imposed upon the holder of the supreme authority in consequence of the revolution had, strictly viewed, only a practical and moral value. When therefore the consul acted within the old regal jurisdiction, he might in so acting perpetrate an injustice, but he committed no crime and consequently was not amenable for what he did to the penal judge.

Page 228

A limitation similar in its tendency took place in the civil jurisdiction; for probably there was taken from the consuls at the very outset the right of deciding at their discretion a legal dispute between private persons.

Restrictions on the Delegation of Powers

The remodelling of the criminal as of civil procedure stood in connection with a general arrangement respecting the transference of magisterial power to deputies or successors. While the king had been absolutely at liberty to nominate deputies but had never been compelled to do so, the consuls exercised the right of delegating power in an essentially different way. No doubt the rule that, if the supreme magistrate left the city, he had to appoint a warden there for the administration of justice,⁽⁵⁾ remained in force also for the consuls, and the collegiate arrangement was not even extended to such delegation; on the contrary this appointment was laid on the consul who was the last to leave the city. But the right of delegation for the time when the consuls remained in the city was probably restricted, upon the very introduction of this office, by providing that delegation should be prescribed to the consul for definite cases, but should be prohibited for all cases in which it was not so prescribed. According to this principle, as we have said, the whole judicial system was organized. The consul could certainly exercise criminal jurisdiction also as to a capital process in the way of submitting his sentence to the community and having it thereupon confirmed or rejected; but he never, so far as we see, exercised this right, perhaps was soon not allowed to exercise it, and possibly pronounced a criminal judgment only in the case of appeal to the community being for any reason excluded. Direct conflict between the supreme magistrate of the community and the community itself was avoided, and the criminal procedure was organized really in such a way, that the supreme magistracy remained only in theory competent, but always acted through deputies who were necessary though appointed by himself. These were the two—not standing—pronouncers-of-judgment for revolt and high treason (-duoviri perduellionis-) and the two standing trackers of murder, the -quaestores parricidii-. Something similar may perhaps have occurred in the regal period, where the king had himself represented in such processes;⁽⁶⁾ but the standing character of the latter institution, and the collegiate principle carried out in both, belong at any rate to the republic. The latter arrangement became of great importance also, in so far that thereby for the first time alongside of the two standing supreme magistrates were placed two assistants, whom each supreme magistrate nominated at his entrance on office, and who in due course also went out with him on his leaving it—whose position thus, like the supreme magistracy itself, was organized according to the principles of a standing office, of a collegiate form, and of an annual tenure. This was not indeed as yet the inferior magistracy itself, at least not in the sense which the republic associated with the magisterial position, inasmuch as the commissioners did not emanate from the choice of the community; but it doubtless became the starting-point for the institution of subordinate magistrates, which was afterwards developed in so manifold ways.

Page 229

In a similar way the decision in civil procedure was withdrawn from the supreme magistracy, inasmuch as the right of the king to transfer an individual process for decision to a deputy was converted into the duty of the consul, after settling the legitimate title of the party and the object of the suit, to refer the disposal of it to a private man to be selected by him and furnished by him with instructions.

In like manner there was left to the consuls the important administration of the state-treasure and of the state-archives; nevertheless probably at once, or at least very early, there were associated with them standing assistants in that duty, namely, those quaestors who, doubtless, had in exercising this function absolutely to obey them, but without whose previous knowledge and co-operation the consuls could not act.

Where on the other hand such directions were not in existence, the president of the community in the capital had personally to intervene; as indeed, for example, at the introductory steps of a process he could not under any circumstances let himself be represented by deputy.

This double restriction of the consular right of delegation subsisted for the government of the city, and primarily for the administration of justice and of the state-chest. As commander-in-chief, on the other hand, the consul retained the right of handing over all or any of the duties devolving on him. This diversity in the treatment of civil and military delegation explains why in the government of the Roman community proper no delegated magisterial authority (-pro magistrate-) was possible, nor were purely urban magistrates ever represented by non-magistrates; and why, on the other hand, military deputies (-pro consuls-, -pro praetore-, -pro quaestore-) were excluded from all action within the community proper.

Nominating a Successor

The right of nominating a successor had not been possessed by the king, but only by the interrex.⁽⁷⁾ The consul was in this respect placed on a like footing with the latter; nevertheless, in the event of his not having exercised the power, the interrex stepped in as before, and the necessary continuity of the office subsisted still undiminished under the republican government. The right of nomination, however, was materially restricted in favour of the burgesses, as the consul was bound to procure the assent of the burgesses for the successors designated by him, and, in the sequel, to nominate only those whom the community designated to him. Through this binding right of proposal the nomination of the ordinary supreme magistrates doubtless in a certain sense passed substantially into the hands of the community; practically, however, there still existed a very considerable distinction between that right of proposal and the right of formal nomination. The consul conducting the election was by no means a mere returning officer; he could still, e. g. by virtue of his old royal prerogative

Page 230

reject particular candidates and disregard the votes tendered for them; at first he might even limit the choice to a list of candidates proposed by himself; and—what was of still more consequence—when the collegiate consulship was to be supplemented by the dictator, of whom we shall speak immediately, in so supplementing it the community was not consulted, but on the contrary the consul in that case appointed his colleague with the same freedom, wherewith the interrex had once appointed the king.

Change in the Nomination of Priests

The nomination of the priests, which had been a prerogative of the kings,(8) was not transferred to the consuls; but the colleges of priests filled up the vacancies in their own ranks, while the Vestals and single priests were nominated by the pontifical college, on which devolved also the exercise of the paternal jurisdiction, so to speak, of the community over the priestesses of Vesta. With a view to the performance of these acts, which could only be properly performed by a single individual, the college probably about this period first nominated a president, the -Pontifex maximus-. This separation of the supreme authority in things sacred from the civil power—while the already-mentioned “king for sacrifice” had neither the civil nor the sacred powers of the king, but simply the title, conferred upon him —and the semi-magisterial position of the new high priest, so decidedly contrasting with the character which otherwise marked the priesthood in Rome, form one of the most significant and important peculiarities of this state-revolution, the aim of which was to impose limits on the powers of the magistrates mainly in the interest of the aristocracy.

We have already mentioned that the outward state of the consul was far inferior to that of the regal office hedged round as it was with reverence and terror, that the regal name and the priestly consecration were withheld from him, and that the axe was taken away from his attendants. We have to add that, instead of the purple robe which the king had worn, the consul was distinguished from the ordinary burgess simply by the purple border of his toga, and that, while the king perhaps regularly appeared in public in his chariot, the consul was bound to accommodate himself to the general rule and like every other burgess to go within the city on foot.

The Dictator

These limitations, however, of the plenary power and of the insignia of the magistracy applied in the main only to the ordinary presidency of the community. In extraordinary cases, alongside of, and in a certain sense instead of, the two presidents chosen by the community there emerged a single one, the master of the army (-magister populi-) usually designated as the -dictator-. In the choice of dictator the community exercised no influence at all, but it proceeded solely from the free resolve of one of the consuls for the time being, whose action neither his colleague

Page 231

nor any other authority could hinder. There was no appeal from his sentence any more than from that of the king, unless he chose to allow it. As soon as he was nominated, all the other magistrates were by right subject to his authority. On the other hand the duration of the dictator's office was limited in two ways: first, as the official colleague of those consuls, one of whom had nominated him, he might not remain in office beyond their legal term; and secondly, a period of six months was fixed as the absolute maximum for the duration of his office. It was a further arrangement peculiar to the dictatorship, that the "master of the army" was bound to nominate for himself immediately a "master of horse" (-magister equitum-), who acted along with him as a dependent assistant somewhat as did the quaestor along with the consul, and with him retired from office—an arrangement undoubtedly connected with the fact that the dictator, presumably as being the leader of the infantry, was constitutionally prohibited from mounting on horseback. In the light of these regulations the dictatorship is doubtless to be conceived as an institution which arose at the same time with the consulship, and which was designed, especially in the event of war, to obviate for a time the disadvantages of divided power and to revive temporarily the regal authority; for in war more particularly the equality of rights in the consuls could not but appear fraught with danger; and not only positive testimonies, but above all the oldest names given to the magistrate himself and his assistant, as well as the limitation of the office to the duration of a summer campaign, and the exclusion of the -provocatio- attest the pre-eminently military design of the original dictatorship.

On the whole, therefore, the consuls continued to be, as the kings had been, the supreme administrators, judges, and generals; and even in a religious point of view it was not the -rex sacrorum- (who was only nominated that the name might be preserved), but the consul, who offered prayers and sacrifices for the community, and in its name ascertained the will of the gods with the aid of those skilled in sacred lore. Against cases of emergency, moreover, a power was retained of reviving at any moment, without previous consultation of the community, the full and unlimited regal authority, so as to set aside the limitations imposed by the collegiate arrangement and by the special curtailments of jurisdiction. In this way the problem of legally retaining and practically restricting the regal authority was solved in genuine Roman fashion with equal acuteness and simplicity by the nameless statesmen who worked out this revolution.

Centuries and Curies

Page 232

The community thus acquired by the change of constitution rights of the greatest importance: the right of annually designating its presidents, and that of deciding in the last instance regarding the life or death of the burgess. But the body which acquired these rights could not possibly be the community as it had been hitherto constituted—the patriciate which had practically become an order of nobility. The strength of the nation lay in the “multitude” (-plebs-) which already comprehended in large numbers people of note and of wealth. The exclusion of this multitude from the public assembly, although it bore part of the public burdens, might be tolerated as long as that public assembly itself had no very material share in the working of the state machine, and as long as the royal power by the very fact of its high and free position remained almost equally formidable to the burgesses and to the —metoeci— and thereby maintained equality of legal redress in the nation. But when the community itself was called regularly to elect and to decide, and the president was practically reduced from its master to its commissioner for a set term, this relation could no longer be maintained as it stood; least of all when the state had to be remodelled on the morrow of a revolution, which could only have been carried out by the co-operation of the patricians and the —metoeci—. An extension of that community was inevitable; and it was accomplished in the most comprehensive manner, inasmuch as the collective plebeiate, that is, all the non-burgesses who were neither slaves nor citizens of extraneous communities living at Rome under the -ius hospitii-, were admitted into the burgess-body. The curiate assembly of the old burgesses, which hitherto had been legally and practically the first authority in the state, was almost totally deprived of its constitutional prerogatives. It was to retain its previous powers only in acts purely formal or in those which affected clan-relations —such as the vow of allegiance to be taken to the consul or to the dictator when they entered on office just as previously to the king,(9) and the legal dispensations requisite for an -arrogatio- or a testament—but it was not in future to perform any act of a properly political character. Soon even the plebeians were admitted to the right of voting also in the curies, and by that step the old burgess-body lost the right of meeting and of resolving at all. The curial organization was virtually rooted out, in so far as it was based on the clan-organization and this latter was to be found in its purity exclusively among the old burgesses. When the plebeians were admitted into the curies, they were certainly also allowed to constitute themselves -de jure- as—what in the earlier period they could only have been -de facto-(10)—families and clans; but it is distinctly recorded by tradition and in itself also very conceivable, that only a portion of the plebeians proceeded so far as to constitute -gentes-, and thus the new curiate assembly, in opposition to its original character, included numerous members who belonged to no clan.

Page 233

All the political prerogatives of the public assembly—as well the decision on appeals in criminal causes, which indeed were essentially political processes, as the nomination of magistrates and the adoption or rejection of laws—were transferred to, or were now acquired by, the assembled levy of those bound to military service; so that the centuries now received the rights, as they had previously borne the burdens, of citizens. In this way the small initial movements made by the Servian constitution—such as, in particular, the handing over to the army the right of assenting to the declaration of an aggressive war⁽¹¹⁾—attained such a development that the curies were completely and for ever cast into the shade by the assembly of the centuries, and people became accustomed to regard the latter as the sovereign people. In this assembly debate took place merely when the presiding magistrate chose himself to speak or bade others do so; of course in cases of appeal both parties had to be heard. A simple majority of the centuries was decisive.

As in the curiate assembly those who were entitled to vote at all were on a footing of entire equality, and therefore after the admission of all the plebeians into the curies the result would have been a complete democracy, it may be easily conceived that the decision of political questions continued to be withheld from the curies; the centuriate assembly placed the preponderating influence, not in the hands of the nobles certainly, but in those of the possessors of property, and the important privilege of priority in voting, which often practically decided the election, placed it in the hands of the -equites- or, in other words, of the rich.

Senate

The senate was not affected by the reform of the constitution in the same way as the community. The previously existing college of elders not only continued exclusively patrician, but retained also its essential prerogatives—the right of appointing the interrex, and of confirming or rejecting the resolutions adopted by the community as constitutional or unconstitutional. In fact these prerogatives were enhanced by the reform of the constitution, because the appointment of the magistrates also, which fell to be made by election of the community, was thenceforth subject to the confirmation or rejection of the patrician senate. In cases of appeal alone its confirmation, so far as we know, was never deemed requisite, because in these the matter at stake was the pardon of the guilty and, when this was granted by the sovereign assembly of the people, any cancelling of such an act was wholly out of the question.

Page 234

But, although by the abolition of the monarchy the constitutional rights of the patrician senate were increased rather than diminished, there yet took place—and that, according to tradition, immediately on the abolition of the monarchy—so far as regards other affairs which fell to be discussed in the senate and admitted of a freer treatment, an enlargement of that body, which brought into it plebeians also, and which in its consequences led to a complete remodelling of the whole. From the earliest times the senate had acted also, although not solely or especially, as a state-council; and, while probably even in the time of the kings it was not regarded as unconstitutional for non-senators in this case to take part in the assembly,(12) it was now arranged that for such discussions there should be associated with the patrician senate (-patres-) a number of non-patricians “added to the roll” (-conscripti-). This did not at all put them on a footing of equality; the plebeians in the senate did not become senators, but remained members of the equestrian order, were not designated -patres-but were even now -conscripti-, and had no right to the badge of senatorial dignity, the red shoe.(13) Moreover, they not only remained absolutely excluded from the exercise of the magisterial prerogatives belonging to the senate (-auctoritas-), but were obliged, even where the question had reference merely to an advice (-consilium-), to rest content with the privilege of being present in silence while the question was put to the patricians in turn, and of only indicating their opinion by adding to the numbers when the division was taken—voting with the feet (-pedibus in sententiam ire-, -pedarii-) as the proud nobility expressed it. Nevertheless, the plebeians found their way through the new constitution not merely to the Forum, but also to the senate-house, and the first and most difficult step towards equality of rights was taken in this quarter also.

Otherwise there was no material change in the arrangements affecting the senate. Among the patrician members a distinction of rank soon came to be recognized, especially in putting the vote: those who were proximately designated for the supreme magistracy, or who had already administered it, were entered on the list and were called upon to vote before the rest; and the position of the first of them, the foreman of the senate (-princeps senatus-) soon became a highly coveted place of honour. The consul in office, on the other hand, no more ranked as a member of senate than did the king, and therefore in taking the votes did not include his own. The selection of the members—both of the narrower patrician senate and of those merely added to the roll—fell to be made by the consuls just as formerly by the kings; but the nature of the case implied that, while the king had still perhaps some measure of regard to the representation of the several clans in the senate, this consideration was of no account so far as concerned

Page 235

the plebeians, among whom the clan-organization was but imperfectly developed, and consequently the relation of the senate to that organization in general fell more and more into abeyance. We have no information that the electing consuls were restricted from admitting more than a definite number of plebeians to the senate; nor was there need for such a regulation, because the consuls themselves belonged to the nobility. On the other hand probably from the outset the consul was in virtue of his very position practically far less free, and far more bound by the opinions of his order and by custom, in the appointment of senators than the king. The rule in particular, that the holding of the consulship should necessarily be followed by admission to the senate for life, if, as was probably the case at this time, the consul was not yet a member of it at the time of his election, must have in all probability very early acquired consuetudinary force. In like manner it seems to have become early the custom not to fill up the senators' places immediately on their falling vacant, but to revise and complete the roll of the senate on occasion of the census, consequently, as a rule, every fourth year; which also involved a not unimportant restriction on the authority entrusted with the selection. The whole number of the senators remained as before, and in this the -conscripti- were also included; from which fact we are probably entitled to infer the numerical falling off of the patriciate.(14)

Conservative Character of the Revolution

We thus see that in the Roman commonwealth, even on the conversion of the monarchy into a republic, the old was as far as possible retained. So far as a revolution in a state can be conservative at all, this one was so; not one of the constituent elements of the commonwealth was really overthrown by it. This circumstance indicates the character of the whole movement. The expulsion of the Tarquins was not, as the pitiful and deeply falsified accounts of it represent, the work of a people carried away by sympathy and enthusiasm for liberty, but the work of two great political parties already engaged in conflict, and clearly aware that their conflict would steadily continue—the old burgesses and the —metoeci— —who, like the English Whigs and Tories in 1688, were for a moment united by the common danger which threatened to convert the commonwealth into the arbitrary government of a despot, and differed again as soon as the danger was over. The old burgesses could not get rid of the monarchy without the cooperation of the new burgesses; but the new burgesses were far from being sufficiently strong to wrest the power out of the hands of the former at one blow. Compromises of this sort are necessarily limited to the smallest measure of mutual concessions obtained by tedious bargaining; and they leave the future to decide which of the constituent elements shall eventually preponderate, and whether they will work harmoniously together or counteract one another. To look therefore merely to the direct innovations, possibly to the mere change in the duration of the supreme magistracy, is altogether to mistake the broad import of the first Roman revolution: its indirect effects were by far the most important, and vaster doubtless than even its authors anticipated.

Page 236

The New Community

This, in short, was the time when the Roman burgess-body in the later sense of the term originated. The plebeians had hitherto been —*metoeci*— who were subjected to their share of taxes and burdens, but who were nevertheless in the eye of the law really nothing but tolerated aliens, between whose position and that of foreigners proper it may have seemed hardly necessary to draw a definite line of distinction. They were now enrolled in the lists as burgesses liable to military service, and, although they were still far from being on a footing of legal equality—although the old burgesses still remained exclusively entitled to perform the acts of authority constitutionally pertaining to the council of elders, and exclusively eligible to the civil magistracies and priesthoods, nay even by preference entitled to participate in the usufructs of burgesses, such as the joint use of the public pasture—yet the first and most difficult step towards complete equalization was gained from the time when the plebeians no longer served merely in the common levy, but also voted in the common assembly and in the common council when its opinion was asked, and the head and back of the poorest —*metoikos*— were as well protected by the right of appeal as those of the noblest of the old burgesses.

One consequence of this amalgamation of the patricians and plebeians in a new corporation of Roman burgesses was the conversion of the old burgesses into a clan-nobility, which was incapable of receiving additions or even of filling up its own ranks, since the nobles no longer possessed the right of passing decrees in common assembly and the adoption of new families into the nobility by decree of the community appeared still less admissible. Under the kings the ranks of the Roman nobility had not been thus closed, and the admission of new clans was no very rare occurrence: now this genuine characteristic of patricianism made its appearance as the sure herald of the speedy loss of its political privileges and of its exclusive estimation in the community. The exclusion of the plebeians from all public magistracies and public priesthoods—while they were admissible to the position of officers and senators—and the maintenance, with perverse obstinacy, of the legal impossibility of marriage between old burgesses and plebeians, further impressed on the patriciate from the outset the stamp of an exclusive and wrongly privileged aristocracy.

A second consequence of the new union of the burgesses must have been a more definite regulation of the right of settlement, with reference both to the Latin confederates and to other states. It became necessary—not so much on account of the right of suffrage in the centuries (which indeed belonged only to the freeholder) as on account of the right of appeal, which was intended to be conceded to the plebeian, but not to the foreigner dwelling for a time or even permanently in Rome—to

Page 237

express more precisely the conditions of the acquisition of plebeian rights, and to mark off the enlarged burgess-body in its turn from those who were now the non-burgesses. To this epoch therefore we may trace back—in the views and feelings of the people—both the invidiousness of the distinction between patricians and plebeians, and the strict and haughty line of demarcation between -cives Romani- and aliens. But the former civic distinction was in its nature transient, while the latter political one was permanent; and the sense of political unity and rising greatness, which was thus implanted in the heart of the nation, was expansive enough first to undermine and then to carry away with its mighty current those paltry distinctions.

Law and Edict

It was at this period, moreover, that law and edict were separated. The distinction indeed had its foundation in the essential character of the Roman state; for even the regal power in Rome was subordinate, not superior, to the law of the land. But the profound and practical veneration, which the Romans, like every other people of political capacity, cherished for the principle of authority, gave birth to the remarkable rule of Roman constitutional and private law, that every command of the magistrate not based upon a law was at least valid during his tenure of office, although it expired with that tenure. It is evident that in this view, so long as the presidents were nominated for life, the distinction between law and edict must have practically been almost lost sight of, and the legislative activity of the public assembly could acquire no development. On the other hand it obtained a wide field of action after the presidents were changed annually; and the fact was now by no means void of practical importance, that, if the consul in deciding a process committed a legal informality, his successor could institute a fresh trial of the cause.

Civil and Military Authority

It was at this period, finally, that the provinces of civil and military authority were separated. In the former the law ruled, in the latter the axe: the former was governed by the constitutional checks of the right of appeal and of regulated delegation; in the latter the general held an absolute sway like the king.⁽¹⁵⁾ It was an established principle, that the general and the army as such should not under ordinary circumstances enter the city proper. That organic and permanently operative enactments could only be made under the authority of the civil power, was implied in the spirit, if not in the letter, of the constitution. Instances indeed occasionally occurred where the general, disregarding this principle, convoked his forces in the camp as a burgess assembly, nor was a decree passed under such circumstances legally void; but custom disapproved of such a proceeding, and it soon fell into disuse as though it had been forbidden. The distinction between Quirites and soldiers became more and more deeply rooted in the minds of the burgesses.

Page 238

Government of the Patriciate

Time however was required for the development of these consequences of the new republicanism; vividly as posterity felt its effects, the revolution probably appeared to the contemporary world at first in a different light. The non-burgesses indeed gained by it burgess-rights, and the new burgess-body acquired in the -comitia centuriata- comprehensive prerogatives; but the right of rejection on the part of the patrician senate, which in firm and serried ranks confronted the -comitia- as if it were an Upper House, legally hampered their freedom of movement precisely in the most important matters, and although not in a position to thwart the serious will of the collective body, could yet practically delay and cripple it. If the nobility in giving up their claim to be the sole embodiment of the community did not seem to have lost much, they had in other respects decidedly gained. The king, it is true, was a patrician as well as the consul, and the right of nominating the members of the senate belonged to the latter as to the former; but while his exceptional position raised the former no less above the patricians than above the plebeians, and while cases might easily occur in which he would be obliged to lean upon the support of the multitude even against the nobility, the consul—ruling for a brief term, but before and after that term simply one of the nobility, and obeying to-morrow the noble fellow-burgess whom he had commanded to-day—by no means occupied a position aloof from his order, and the spirit of the noble in him must have been far more powerful than that of the magistrate. Indeed, if at any time by way of exception a patrician disinclined to the rule of the nobility was called to the government, his official authority was paralyzed partly by the priestly colleges, which were pervaded by an intense aristocratic spirit, partly by his colleague, and was easily suspended by the dictatorship; and, what was of still more moment, he wanted the first element of political power, time. The president of a commonwealth, whatever plenary authority may be conceded to him, will never gain possession of political power, if he does not continue for some considerable time at the head of affairs; for a necessary condition of every dominion is duration. Consequently the senate appointed for life inevitably acquired—and that by virtue chiefly of its title to advise the magistrate in all points, so that we speak not of the narrower patrician, but of the enlarged patricio-plebeian, senate—so great an influence as contrasted with the annual rulers, that their legal relations became precisely inverted; the senate substantially assumed to itself the powers of government, and the former ruler sank into a president acting as its chairman and executing its decrees. In the case of every proposal to be submitted to the community for acceptance or rejection the practice of previously consulting the whole senate and obtaining its approval, while

Page 239

not constitutionally necessary, was consecrated by use and wont; and it was not lightly or willingly departed from. The same course was followed in the case of important state-treaties, of the management and distribution of the public lands, and generally of every act the effects of which extended beyond the official year; and nothing was left to the consul but the transaction of current business, the initial steps in civil processes, and the command in war. Especially important in its consequences was the change in virtue of which neither the consul, nor even the otherwise absolute dictator, was permitted to touch the public treasure except with the consent and by the will of the senate. The senate made it obligatory on the consuls to commit the administration of the public chest, which the king had managed or might at any rate have managed himself, to two standing subordinate magistrates, who were nominated no doubt by the consuls and had to obey them, but were, as may easily be conceived, much more dependent than the consuls themselves on the senate.⁽¹⁶⁾ It thus drew into its own hands the management of finance; and this right of sanctioning the expenditure of money on the part of the Roman senate may be placed on a parallel in its effects with the right of sanctioning taxation in the constitutional monarchies of the present day.

The consequences followed as a matter of course. The first and most essential condition of all aristocratic government is, that the plenary power of the state be vested not in an individual but in a corporation. Now a preponderantly aristocratic corporation, the senate, had appropriated to itself the government, and at the same time the executive power not only remained in the hands of the nobility, but was also entirely subject to the governing corporation. It is true that a considerable number of men not belonging to the nobility sat in the senate; but as they were incapable of holding magistracies or even of taking part in the debates, and thus were excluded from all practical share in the government, they necessarily played a subordinate part in the senate, and were moreover kept in pecuniary dependence on the corporation through the economically important privilege of using the public pasture. The gradually recognized right of the patrician consuls to revise and modify the senatorial list at least every fourth year, ineffective as presumably it was over against the nobility, might very well be employed in their interest, and an obnoxious plebeian might by means of it be kept out of the senate or even be removed from its ranks.

The Plebeian Opposition

Page 240

It is therefore quite true that the immediate effect of the revolution was to establish the aristocratic government. It is not, however, the whole truth. While the majority of contemporaries probably thought that the revolution had brought upon the plebeians only a more rigid despotism, we who come afterwards discern in that very revolution the germs of young liberty. What the patricians gained was gained at the expense not of the community, but of the magistrate's power. It is true that the community gained only a few narrowly restricted rights, which were far less practical and palpable than the acquisitions of the nobility, and which not one in a thousand probably had the wisdom to value; but they formed a pledge and earnest of the future. Hitherto the —metoeci— had been politically nothing, the old burgesses had been everything; now that the former were embraced in the community, the old burgesses were overcome; for, however much might still be wanting to full civil equality, it is the first breach, not the occupation of the last post, that decides the fall of the fortress. With justice therefore the Roman community dated its political existence from the beginning of the consulate.

While however the republican revolution may, notwithstanding the aristocratic rule which in the first instance it established, be justly called a victory of the former —metoeci— or the -plebs-, the revolution even in this respect bore by no means the character which we are accustomed in the present day to designate as democratic. Pure personal merit without the support of birth and wealth could perhaps gain influence and consideration more easily under the regal government than under that of the patriciate. Then admission to the patriciate was not in law foreclosed; now the highest object of plebeian ambition was to be admitted into the dumb appendage of the senate. The nature of the case implied that the governing aristocratic order, so far as it admitted plebeians at all, would grant the right of occupying seats in the senate not absolutely to the best men, but chiefly to the heads of the wealthy and notable plebeian families; and the families thus admitted jealously guarded the possession of the senatorial stalls. While a complete legal equality therefore had subsisted within the old burgess-body, the new burgess-body or former —metoeci— came to be in this way divided from the first into a number of privileged families and a multitude kept in a position of inferiority. But the power of the community now according to the centuriate organization came into the hands of that class which since the Servian reform of the army and of taxation had borne mainly the burdens of the state, namely the freeholders, and indeed not so much into the hands of the great proprietors or into those of the small cottagers, as into those of the intermediate class of farmers—an arrangement in which the seniors were still so far privileged that, although less numerous, they had as

Page 241

many voting-divisions as the juniors. While in this way the axe was laid to the root of the old burgess-body and their clan-nobility, and the basis of a new burgess-body was laid, the preponderance in the latter rested on the possession of land and on age, and the first beginnings were already visible of a new aristocracy based primarily on the actual consideration in which the families were held—the future nobility. There could be no clearer indication of the fundamentally conservative character of the Roman commonwealth than the fact, that the revolution which gave birth to the republic laid down at the same time the primary outlines of a new organization of the state, which was in like manner conservative and in like manner aristocratic.

Notes for Book II Chapter I

1. I. IX. The Tarquins

2. The well-known fable for the most part refutes itself. To a considerable extent it has been concocted for the explanation of surnames (-Brutus-, -Poplicola-, -Scaevola-). But even its apparently historical ingredients are found on closer examination to have been invented. Of this character is the statement that Brutus was captain of the horsemen (-tribunus celerum-) and in that capacity proposed the decree of the people as to the banishment of the Tarquins; for, according to the Roman constitution, it is quite impossible that a mere officer should have had the right to convoke the curies. The whole of this statement has evidently been invented with the view of furnishing a legal basis for the Roman republic; and very ill invented it is, for in its case the -tribunus celerum- is confounded with the entirely different -magister equitum- (V. Burdens Of The Burgesses f.), and then the right of convoking the centuries which pertained to the latter by virtue of his praetorian rank is made to apply to the assembly of the curies.

3. -Consules- are those who “leap or dance together,” as -praesul- is one who “leaps before,” -exsul-, one who “leaps out” (—o ekpeson—), -insula-, a “leap into,” primarily applied to a mass of rock fallen into the sea.

4. The day of entering on office did not coincide with the beginning of the year (1st March), and was not at all fixed. The day of retiring was regulated by it, except when a consul was elected expressly in room of one who had dropped out (-consul suffectus-); in which case the substitute succeeded to the rights and consequently to the term of him whom he replaced. But these supplementary consuls in the earlier period only occurred when merely one of the consuls had dropped out: pairs of supplementary consuls are not found until the later ages of the republic. Ordinarily, therefore, the official year of a consul consisted of unequal portions of two civil years.

11. I. Vi. Political Effects of the Servian Military Organization

12. I. V. The Senate as State Council

13. I. V. Prerogatives of the Senate

14. That the first consuls admitted to the senate 164 plebeians, is hardly to be regarded as a historical fact, but rather as a proof that the later Roman archaeologists were unable to point out more than 136 -gentes- of the Roman nobility (Rom, Forsch. i. 121).

15. It may not be superfluous to remark, that the -iudicium legitimum-, as well as that -quod imperio continetur-, rested on the imperium of the directing magistrate, and the distinction only consisted in the circumstance that the -imperium- was in the former case limited by the -lex-, while in the latter it was free.

16. II. I. Restrictions on the Delegation of Powers

CHAPTER II

The Tribune of the Plebs and the Decemvirate

Material Interests

Under the new organization of the commonwealth the old burgesses had attained by legal means to the full possession of political power. Governing through the magistracy which had been reduced to be their servant, preponderating in the Senate, in sole possession of all public offices and priesthoods, armed with exclusive cognizance of things human and divine and familiar with the whole routine of political procedure, influential in the public assembly through the large number of pliant adherents attached to the several families, and, lastly, entitled to examine and to reject every decree of the community,—the patricians might have long preserved their practical power, just because they had at the right time abandoned their claim to sole legal authority. It is true that the plebeians could not but be painfully sensible of their political disabilities; but undoubtedly in the first instance the nobility had not much to fear from a purely political opposition, if it understood the art of keeping the multitude, which desired nothing but equitable administration and protection of its material interests, aloof from political strife. In fact during the first period after the expulsion of the kings we meet with various measures which were intended, or at any rate seemed to be intended, to gain the favour of the commons for the government of the nobility especially on economic grounds.

The port-dues were reduced; when the price of grain was high, large quantities of corn were purchased on account of the state, and the trade in salt was made a state-monopoly, in order to supply the citizens with corn and salt at reasonable prices; lastly, the national festival was prolonged for an additional day. Of the same character was the ordinance which we have already mentioned respecting property fines,(1) which was not merely intended in general

Page 243

to set limits to the dangerous fining-prerogative of the magistrates, but was also, in a significant manner, calculated for the especial protection of the man of small means. The magistrate was prohibited from fining the same man on the same day to an extent beyond two sheep or beyond thirty oxen, without granting leave to appeal; and the reason of these singular rates can only perhaps be found in the fact, that in the case of the man of small means possessing only a few sheep a different maximum appeared necessary from that fixed for the wealthy proprietor of herds of oxen—a considerate regard to the wealth or poverty of the person fined, from which modern legislators might take a lesson.

But these regulations were merely superficial; the main current flowed in the opposite direction. With the change in the constitution there was introduced a comprehensive revolution in the financial and economic relations of Rome. The government of the kings had probably abstained on principle from enhancing the power of capital, and had promoted as far as it could an increase in the number of farms. The new aristocratic government, again, appears to have aimed from the first at the destruction of the middle classes, particularly of the intermediate and smaller holdings of land, and at the development of a domination of landed and moneyed lords on the one hand, and of an agricultural proletariat on the other.

Rising Power of the Capitalists

The reduction of the port-dues, although upon the whole a popular measure, chiefly benefited the great merchant. But a much greater accession to the power of capital was supplied by the indirect system of finance-administration. It is difficult to say what were the remote causes that gave rise to it: but, while its origin may probably be referred to the regal period, after the introduction of the consulate the importance of the intervention of private agency must have been greatly increased, partly by the rapid succession of magistrates in Rome, partly by the extension of the financial action of the treasury to such matters as the purchase and sale of grain and salt; and thus the foundation must have been laid for that system of farming the finances, the development of which became so momentous and so pernicious for the Roman commonwealth. The state gradually put all its indirect revenues and all its more complicated payments and transactions into the hands of middlemen, who gave or received a round sum and then managed the matter for their own benefit. Of course only considerable capitalists and, as the state looked strictly to tangible security, in the main only large landholders, could enter into such engagements: and thus there grew up a class of tax-farmers and contractors, who, in the rapid growth of their wealth, in their power over the state to which they appeared to be servants, and in the absurd and sterile basis of their moneyed dominion, quite admit of comparison with the speculators on the stock exchange of the present day.

Page 244

Public Land

The concentrated aspect assumed by the administration of finance showed itself first and most palpably in the treatment of the public lands, which tended almost directly to accomplish the material and moral annihilation of the middle classes. The use of the public pasture and of the state-domains generally was from its very nature a privilege of burgesses; formal law excluded the plebeian from the joint use of the common pasture. As however, apart from the conversion of the public land into private property or its assignation, Roman law knew no fixed rights of usufruct on the part of individual burgesses to be respected like those of property, it depended solely on the pleasure of the king, so long as the public land remained such, to grant and to define its joint enjoyment; and it is not to be doubted that he frequently made use of his right, or at least his power, as to this matter in favour of plebeians. But on the introduction of the republic the principle was again strictly insisted on, that the use of the common pasture belonged in law merely to the burgess of best right, or in other words to the patrician; and, though the senate still as before allowed exceptions in favour of the wealthy plebeian houses represented in it, the small plebeian landholders and the day-labourers, who stood most in need of the common pasture, had its joint enjoyment injuriously withheld from them. Moreover there had hitherto been paid for the cattle driven out on the common pasture a grazing-tax, which was moderate enough to make the right of using that pasture still be regarded as a privilege, and yet yielded no inconsiderable revenue to the public purse. The patrician quaestors were now remiss and indulgent in levying it, and gradually allowed it to fall into desuetude. Hitherto, particularly when new domains were acquired by conquest, allocations of land had been regularly arranged, in which all the poorer burgesses and —metoeci— were provided for; it was only the land which was not suitable for agriculture that was annexed to the common pasture. The ruling class did not venture wholly to give up such assignations, and still less to propose them merely in favour of the rich; but they became fewer and scantier, and were replaced by the pernicious system of occupation—that is to say, the cession of domain-lands, not in property or under formal lease for a definite term, but in special usufruct until further notice, to the first occupant and his heirs-at-law, so that the state was at any time entitled to resume them, and the occupier had to pay the tenth sheaf, or in oil and wine the fifth part of the produce, to the exchequer. This was simply the -precarium- already described(2) applied to the state-domains, and may have been already in use as to the public land at an earlier period, particularly as a temporary arrangement until its assignation should be carried out. Now, however, not only did this occupation-tenure

Page 245

become permanent, but, as was natural, none but privileged persons or their favourites participated, and the tenth and fifth were collected with the same negligence as the grazing-money. A threefold blow was thus struck at the intermediate and smaller landholders: they were deprived of the common usufructs of burgesses; the burden of taxation was increased in consequence of the domain revenues no longer flowing regularly into the public chest; and those land-allocations were stopped, which had provided a constant outlet for the agricultural proletariat somewhat as a great and well-regulated system of emigration would do at the present day. To these evils was added the farming on a large scale, which was probably already beginning to come into vogue, dispossessing the small agrarian clients, and in their stead cultivating the estates by rural slaves; a blow, which was more difficult to avert and perhaps more pernicious than all those political usurpations put together. The burdensome and partly unfortunate wars, and the exorbitant taxes and task-works to which these gave rise, filled up the measure of calamity, so as either to deprive the possessor directly of his farm and to make him the bondsman if not the slave of his creditor-lord, or to reduce him through encumbrances practically to the condition of a temporary lessee of his creditor. The capitalists, to whom a new field was here opened of lucrative speculation unattended by trouble or risk, sometimes augmented in this way their landed property; sometimes they left to the farmer, whose person and estate the law of debt placed in their hands, nominal proprietorship and actual possession. The latter course was probably the most common as well as the most pernicious; for while utter ruin might thereby be averted from the individual, this precarious position of the farmer, dependent at all times on the mercy of his creditor—a position in which he knew nothing of property but its burdens—threatened to demoralise and politically to annihilate the whole farmer-class. The intention of the legislator, when instead of mortgaging he prescribed the immediate transfer of the property to the creditor with a view to prevent insolvency and to devolve the burdens of the state on the real holders of the soil,(3) was evaded by the rigorous system of personal credit, which might be very suitable for merchants, but ruined the farmers. The free divisibility of the soil always involved the risk of an insolvent agricultural proletariat; and under such circumstances, when all burdens were increasing and all means of deliverance were foreclosed, distress and despair could not but spread with fearful rapidity among the agricultural middle class.

Relations of the Social Question to the Question between Orders

Page 246

The distinction between rich and poor, which arose out of these relations, by no means coincided with that between the clans and the plebeians. If far the greater part of the patricians were wealthy landholders, opulent and considerable families were, of course, not wanting among the plebeians; and as the senate, which even then perhaps consisted in greater part of plebeians, had assumed the superintendence of the finances to the exclusion even of the patrician magistrates, it was natural that all those economic advantages, for which the political privileges of the nobility were abused, should go to the benefit of the wealthy collectively; and the pressure fell the more heavily upon the commons, since those who were the ablest and the most capable of resistance were by their admission to the senate transferred from the class of the oppressed to the ranks of the oppressors.

But this state of things prevented the political position of the aristocracy from being permanently tenable. Had it possessed the self-control to govern justly and to protect the middle class—as individual consuls from its ranks endeavoured, but from the reduced position of the magistracy were unable effectually, to do—it might have long maintained itself in sole possession of the offices of state. Had it been willing to admit the wealthy and respectable plebeians to full equality of rights—possibly by connecting the acquisition of the patriciate with admission into the senate—both might long have governed and speculated with impunity. But neither of these courses was adopted; the narrowness of mind and short-sightedness, which are the proper and inalienable privileges of all genuine patricianism, were true to their character also in Rome, and rent the powerful commonwealth asunder in useless, aimless, and inglorious strife.

Secession to the Sacred Mount

The immediate crisis however proceeded not from those who felt the disabilities of their order, but from the distress of the farmers. The rectified annals place the political revolution in the year 244, the social in the years 259 and 260; they certainly appear to have followed close upon each other, but the interval was probably longer. The strict enforcement of the law of debt—so runs the story—excited the indignation of the farmers at large. When in the year 259 the levy was called forth for a dangerous war, the men bound to serve refused to obey the command. Thereupon the consul Publius Servilius suspended for a time the application of the debtor-laws, and gave orders to liberate the persons already imprisoned for debt as well as prohibited further arrests; so that the farmers took their places in the ranks and helped to secure the victory. On their return from the field of battle the peace, which had been achieved by their exertions, brought back their prison and their chains: with merciless rigour the second consul, Appius Claudius, enforced the debtor-laws and

Page 247

his colleague, to whom his former soldiers appealed for aid, dared not offer opposition. It seemed as if collegiate rule had been introduced not for the protection of the people, but to facilitate breach of faith and despotism; they endured, however, what could not be changed. But when in the following year the war was renewed, the word of the consul availed no longer. It was not till Manius Valerius was nominated dictator that the farmers submitted, partly from their awe of the higher magisterial authority, partly from their confidence in his friendly feeling to the popular cause—for the Valerii were one of those old patrician clans by whom government was esteemed a privilege and an honour, not a source of gain. The victory was again with the Roman standards; but when the victors came home and the dictator submitted his proposals of reform to the senate, they were thwarted by its obstinate opposition. The army still stood in its array, as usual, before the gates of the city. When the news arrived, the long threatening storm burst forth; the -esprit de corps- and the compact military organization carried even the timid and the indifferent along with the movement. The army abandoned its general and its encampment, and under the leadership of the commanders of the legions—the military tribunes, who were at least in great part plebeians—marched in martial order into the district of Crustumeria between the Tiber and the Anio, where it occupied a hill and threatened to establish in this most fertile part of the Roman territory a new plebeian city. This secession showed in a palpable manner even to the most obstinate of the oppressors that such a civil war must end with economic ruin to themselves; and the senate gave way. The dictator negotiated an agreement; the citizens returned within the city walls; unity was outwardly restored. The people gave Manius Valerius thenceforth the name of “the great” (-maximus-)—and called the mount beyond the Anio “the sacred mount.” There was something mighty and elevating in such a revolution, undertaken by the multitude itself without definite guidance under generals whom accident supplied, and accomplished without bloodshed; and with pleasure and pride the citizens recalled its memory. Its consequences were felt for many centuries: it was the origin of the tribunate of the plebs.

Plebian Tribunes and Plebian Aediles

In addition to temporary enactments, particularly for remedying the most urgent distress occasioned by debt, and for providing for a number of the rural population by the founding of various colonies, the dictator carried in constitutional form a law, which he moreover —doubtless in order to secure amnesty to the burgesses for the breach of their military oath—caused every individual member of the community to swear to, and then had it deposited in a temple under the charge and custody of two magistrates specially appointed from the plebs for the purpose,

Page 248

the two “house-masters” (-aediles-). This law placed by the side of the two patrician consuls two plebeian tribunes, who were to be elected by the plebeians assembled in curies. The power of the tribunes was of no avail in opposition to the military -imperium-, that is, in opposition to the authority of the dictator everywhere or to that of the consuls beyond the city; but it confronted, on a footing of independence and equality, the ordinary civil powers which the consuls exercised. There was, however, no partition of powers. The tribunes obtained the right which pertained to the consul against his fellow-consul and all the more against an inferior magistrate,⁽⁴⁾ namely, the right to cancel any command issued by a magistrate, as to which the burgess whom it affected held himself aggrieved and lodged a complaint, through their protest timeously and personally interposed, and likewise of hindering or cancelling at discretion any proposal made by a magistrate to the burgesses, in other words, the right of intercession or the so-called tribunician veto.

Intercession

The power of the tribunes, therefore, primarily involved the right of putting a stop to administration and to judicial action at their pleasure, of enabling a person bound to military service to withhold himself from the levy with impunity, of preventing or cancelling the raising of an action and legal execution against the debtor, the initiation of a criminal process and the arrest of the accused while the investigation was pending, and other powers of the same sort. That this legal help might not be frustrated by the absence of the helpers, it was further ordained that the tribune should not spend a night out of the city, and that his door must stand open day and night. Moreover, it lay in the power of the tribunate of the people through a single word of a single tribune to restrain the adoption of a resolution by the community, which otherwise by virtue of its sovereign right might have without ceremony recalled the privileges conferred by it on the plebs.

But these rights would have been ineffective, if there had not belonged to the tribune of the people an instantaneously operative and irresistible power of enforcing them against him who did not regard them, and especially against the magistrate contravening them. This was conferred in such a form that the acting in opposition to the tribune when making use of his right, above all things the laying hands on his person, which at the Sacred Mount every plebeian, man by man for himself and his descendants, had sworn to protect now and in all time to come from all harm, should be a capital crime; and the exercise of this criminal justice was committed not to the magistrates of the community but to those of the plebs. The tribune might in virtue of this his judicial office call to account any burgess, especially the consul in office, have him seized if he should not voluntarily submit, place

Page 249

him under arrest during investigation or allow him to find bail, and then sentence him to death or to a fine. For this purpose the two plebeian aediles appointed at the same time were attached to the tribunes as their servants and assistants, primarily to effect arrest, on which account the same inviolable character was assured to them also by the collective oath of the plebeians. Moreover the aediles themselves had judicial powers like the tribunes, but only for the minor causes that might be settled by fines. If an appeal was lodged against the decision of tribune or aedile, it was addressed not to the whole body of the burgesses, with which the officials of the plebs were not entitled at all to transact business, but to the whole body of the plebeians, which in this case met by curies and finally decided by majority of votes.

This procedure certainly savoured of violence rather than of justice, especially when it was adopted against a non-plebeian, as must in fact have been ordinarily the case. It was not to be reconciled either with the letter or the spirit of the constitution that a patrician should be called to account by authorities who presided not over the body of burgesses, but over an association formed within it, and that he should be compelled to appeal, not to the burgesses, but to this very association. This was originally without question Lynch justice; but the self-help was doubtless carried into effect from early times in form of law, and was after the legal recognition of the tribunate of the plebs regarded as lawfully admissible.

In point of intention this new jurisdiction of the tribunes and the aediles, and the appellate decision of the plebeian assembly therein originating, were beyond doubt just as much bound to the laws as the jurisdiction of the consuls and quaestors and the judgment of the centuries on appeal; the legal conceptions of crime against the community⁽⁵⁾ and of offences against order⁽⁶⁾ were transferred from the community and its magistrates to the plebs and its champions. But these conceptions were themselves so little fixed, and their statutory definition was so difficult and indeed impossible, that the administration of justice under these categories from its very nature bore almost inevitably the stamp of arbitrariness. And now when the very idea of right had become obscured amidst the struggles of the orders, and when the legal party—leaders on both sides were furnished with a co-ordinate jurisdiction, this jurisdiction must have more and more approximated to a mere arbitrary police. It affected in particular the magistrate. Hitherto the latter according to Roman state law, so long as he was a magistrate, was amenable to no jurisdiction at all, and, although after demitting his office he might have been legally made responsible for each of his acts, the exercise of this right lay withal in the hands of the members of his own order and ultimately of the collective community, to which these likewise belonged.

Page 250

Now in the tribunician jurisdiction there emerged a new power, which on the one hand might interfere against the supreme magistrate even during his tenure of office, and on the other hand was wielded against the noble burgesses exclusively by the non-noble, and which was the more oppressive that neither the crime nor its punishment was formally defined by law. In reality through the co-ordinate jurisdiction of the plebs and the community the estates, limbs, and lives of the burgesses were abandoned to the arbitrary pleasure of the party assemblies.

In civil jurisdiction the plebeian institutions interfered only so far, that in the processes affecting freedom, which were so important for the plebs, the nomination of jurymen was withdrawn from the consuls, and the decisions in such cases were pronounced by the “ten-men-judges” destined specially for that purpose (-iudices-, -decemviri-, afterwards -decemviri litibus iudicandis-).

Legislation

With this co-ordinate jurisdiction there was further associated a co-ordinate initiative in legislation. The right of assembling the members and of procuring decrees on their part already pertained to the tribunes, in so far as no association at all can be conceived without such a right. But it was conferred upon them, in a marked way, by legally securing that the autonomous right of the plebs to assemble and pass resolutions should not be interfered with on the part of the magistrates of the community or, in fact, of the community itself. At all events it was the necessary preliminary to the legal recognition of the plebs generally, that the tribunes could not be hindered from having their successors elected by the assembly of the plebs and from procuring the confirmation of their criminal sentences by the same body; and this right accordingly was further specially guaranteed to them by the Icilian law (262), which threatened with severe punishment any one who should interrupt the tribune while speaking, or should bid the assembly disperse. It is evident that under such circumstances the tribune could not well be prevented from taking a vote on other proposals than the choice of his successor and the confirmation of his sentences. Such “resolves of the multitude” (-plebi scita-) were not indeed strictly valid decrees of the people; on the contrary, they were at first little more than are the resolutions of our modern public meetings; but, as the distinction between the comitia of the people and the councils of the multitude was of a formal nature rather than aught else, the validity of these resolves as autonomous determinations of the community was at once claimed at least on the part of the plebeians, and the Icilian law for instance was immediately carried in this way. Thus was the tribune of the people appointed as a shield and protection for the individual, and as leader and manager for all, provided with unlimited judicial power in criminal proceedings, that in this way he might give emphasis to his command, and lastly even pronounced to be in his person inviolable (-sacrosanctus-), inasmuch as whoever laid hands upon him or his servant was not merely regarded as incurring the vengeance of

the gods, but was also among men accounted as if, after legally proven crime, deserving of death.

Page 251

Relation of the Tribune to the Consul

The tribunes of the multitude (-tribuni plebis-) arose out of the military tribunes and derived from them their name; but constitutionally they had no further relation to them. On the contrary, in respect of powers the tribunes of the plebs stood on a level with the consuls. The appeal from the consul to the tribune, and the tribune's right of intercession in opposition to the consul, were, as has been already said, precisely of the same nature with the appeal from consul to consul and the intercession of the one consul in opposition to the other; and both cases were simply applications of the general principle of law that, where two equal authorities differ, the veto prevails over the command. Moreover the original number (which indeed was soon augmented), and the annual duration of the magistracy, which in the case of the tribunes changed its occupants on the 10th of December, were common to the tribunes and the consuls. They shared also the peculiar collegiate arrangement, which placed the full powers of the office in the hands of each individual consul and of each individual tribune, and, when collisions occurred within the college, did not count the votes, but gave the Nay precedence over the Yea; for which reason, when a tribune forbade, the veto of the individual was sufficient notwithstanding the opposition of his colleagues, while on the other hand, when he brought an accusation, he could be thwarted by any one of those colleagues. Both consuls and tribunes had full and co-ordinate criminal jurisdiction, although the former exercised it indirectly, and the latter directly; as the two quaestors were attached to the former, the two aediles were associated with the latter.(7) The consuls were necessarily patricians, the tribunes necessarily plebeians. The former had the ampler power, the latter the more unlimited, for the consul submitted to the prohibition and the judgment of the tribunes, but the tribune did not submit himself to the consul. Thus the tribunician power was a copy of the consular; but it was none the less a contrast to it. The power of the consuls was essentially positive, that of the tribunes essentially negative. The consuls alone were magistrates of the Roman people, not the tribunes; for the former were elected by the whole burgesses, the latter only by the plebeian association. In token of this the consul appeared in public with the apparel and retinue pertaining to state-officials; the tribunes sat on a stool instead of the "chariot seat," and lacked the official attendants, the purple border, and generally all the insignia of magistracy: even in the senate the tribune had neither presidency nor so much as a seat. Thus in this remarkable institution absolute prohibition was in the most stern and abrupt fashion opposed to absolute command; the quarrel was settled by legally recognizing and regulating the discord between rich and poor.

Political Value of the Tribunate

Page 252

But what was gained by a measure which broke up the unity of the state; which subjected the magistrates to a controlling authority unsteady in its action and dependent on all the passions of the moment; which in the hour of peril might have brought the administration to a dead-lock at the bidding of any one of the opposition chiefs elevated to the rival throne; and which, by investing all the magistrates with co-ordinate jurisdiction in the administration of criminal law, as it were formally transferred that administration from the domain of law to that of politics and corrupted it for all time coming? It is true indeed that the tribunate, if it did not directly contribute to the political equalization of the orders, served as a powerful weapon in the hands of the plebeians when these soon afterwards desired admission to the offices of state. But this was not the real design of the tribunate. It was a concession wrung not from the politically privileged order, but from the rich landlords and capitalists; it was designed to ensure to the commons equitable administration of law, and to promote a more judicious administration of finance. This design it did not, and could not, fulfil. The tribune might put a stop to particular iniquities, to individual instances of crying hardship; but the fault lay not in the unfair working of a righteous law, but in a law which was itself unrighteous, and how could the tribune regularly obstruct the ordinary course of justice? Could he have done so, it would have served little to remedy the evil, unless the sources of impoverishment were stopped—the perverse taxation, the wretched system of credit, and the pernicious occupation of the domain-lands. But such measures were not attempted, evidently because the wealthy plebeians themselves had no less interest in these abuses than the patricians. So this singular magistracy was instituted, which presented to the commons an obvious and available aid, and yet could not possibly carry out the necessary economic reform. It was no proof of political wisdom, but a wretched compromise between the wealthy aristocracy and the leaderless multitude. It has been affirmed that the tribunate of the people preserved Rome from tyranny. Were it true, it would be of little moment: a change in the form of the state is not in itself an evil for a people; on the contrary, it was a misfortune for the Romans that monarchy was introduced too late, after the physical and mental energies of the nation were exhausted. But the assertion is not even correct; as is shown by the circumstance that the Italian states remained as regularly free from tyrants as the Hellenic states regularly witnessed their emergence. The reason lies simply in the fact that tyranny is everywhere the result of universal suffrage, and that the Italians excluded the burgesses who had no land from their public assemblies longer than the Greeks did: when Rome departed from this course, monarchy did not fail to emerge, and was in fact associated

Page 253

with this very tribunician orifice. That the tribunate had its use, in pointing out legitimate paths of opposition and averting many a wrong, no one will fail to acknowledge; but it is equally evident that, where it did prove useful, it was employed for very different objects from those for which it had been established. The bold experiment of allowing the leaders of the opposition a constitutional veto, and of investing them with power to assert it regardless of the consequences, proved to be an expedient by which the state was politically unhinged; and social evils were prolonged by the application of useless palliatives.

Further Dissensions

Now that civil war was organized, it pursued its course. The parties stood face to face as if drawn up for battle, each under its leaders. Restriction of the consular and extension of the tribunician power were the objects contended for on the one side; the annihilation of the tribunate was sought on the other. Legal impunity secured for insubordination, refusal to enter the ranks for the defence of the land, impeachments involving fines and penalties directed specially against magistrates who had violated the rights of the commons or who had simply provoked their displeasure, were the weapons of the plebeians; and to these the patricians opposed violence, concert with the public foes, and occasionally also the dagger of the assassin. Hand-to-hand conflicts took place in the streets, and on both sides the sacredness of the magistrate's person was violated. Many families of burgesses are said to have migrated, and to have sought more peaceful abodes in neighbouring communities; and we may well believe it. The strong patriotism of the people is obvious from the fact, not that they adopted this constitution, but that they endured it, and that the community, notwithstanding the most vehement convulsions, still held together.

Coriolanus

The best-known incident in these conflicts of the orders is the history of Gnaeus Marcius, a brave aristocrat, who derived his surname from the storming of Corioli. Indignant at the refusal of the centuries to entrust to him the consulate in the year 263, he is reported to have proposed, according to one version, the suspension of the sales of corn from the state-stores, till the hungry people should give up the tribunate; according to another version, the direct abolition of the tribunate itself. Impeached by the tribunes so that his life was in peril, it is said that he left the city, but only to return at the head of a Volscian army; that when he was on the point of conquering the city of his fathers for the public foe, the earnest appeal of his mother touched his conscience; and that thus he expiated his first treason by a second, and both by death. How much of this is true cannot be determined; but the story, over which the naive misrepresentations of the Roman annalists have shed a patriotic glory, affords a glimpse of the deep moral and political disgrace

Page 254

of these conflicts between the orders. Of a similar stamp was the surprise of the Capitol by a band of political refugees, led by a Sabine chief, Appius Herdonius, in the year 294; they summoned the slaves to arms, and it was only after a violent conflict, and by the aid of the Tusculans who hastened to render help, that the Roman burgess-force overcame the Catilinarian band. The same character of fanatical exasperation marks other events of this epoch, the historical significance of which can no longer be apprehended in the lying family narratives; such as the predominance of the Fabian clan which furnished one of the two consuls from 269 to 275, and the reaction against it, the emigration of the Fabii from Rome, and their annihilation by the Etruscans on the Cremera (277). Still more odious was the murder of the tribune of the people, Gnaeus Genucius, who had ventured to call two consulars to account, and who on the morning of the day fixed for the impeachment was found dead in bed (281). The immediate effect of this misdeed was the Publilian law (283), one of the most momentous in its consequences with which Roman history has to deal. Two of the most important arrangements—the introduction of the plebeian assembly of tribes, and the placing of the -plebiscitum- on a level, although conditionally, with the formal law sanctioned by the whole community—are to be referred, the former certainly, the latter probably, to the proposal of Volero Publilius the tribune of the people in 283. The plebs had hitherto adopted its resolutions by curies; accordingly in these its separate assemblies, on the one hand, the voting had been by mere number without distinction of wealth or of freehold property, and, on the other hand, in consequence of that standing side by side on the part of the clansmen, which was implied in the very nature of the curial assembly, the clients of the great patrician families had voted with one another in the assembly of the plebeians. These two circumstances had given to the nobility various opportunities of exercising influence on that assembly, and especially of managing the election of tribunes according to their views; and both were henceforth done away by means of the new method of voting according to tribes. Of these, four had been formed under the Servian constitution for the purposes of the levy, embracing town and country alike;(8) subsequently-perhaps in the year 259—the Roman territory had been divided into twenty districts, of which the first four embraced the city and its immediate environs, while the other sixteen were formed out of the rural territory on the basis of the clan-cantons of the earliest Roman domain.(9) To these was added—probably only in consequence of the Publilian law, and with a view to bring about the inequality, which was desirable for voting purposes, in the total number of the divisions—as a twenty-first tribe the Crustuminian, which derived its name from the place where the plebs had constituted

Page 255

itself as such and had established the tribunate;(10) and thenceforth the special assemblies of the plebs took place, no longer by curies, but by tribes. In these divisions, which were based throughout on the possession of land, the voters were exclusively freeholders: but they voted without distinction as to the size of their possession, and just as they dwelt together in villages and hamlets. Consequently, this assembly of the tribes, which otherwise was externally modelled on that of the curies, was in reality an assembly of the independent middle class, from which, on the one hand, the great majority of freedmen and clients were excluded as not being freeholders, and in which, on the other hand, the larger landholders had no such preponderance as in the centuries. This "meeting of the multitude" (-concilium plebis-) was even less a general assembly of the burgesses than the plebeian assembly by curies had been, for it not only, like the latter, excluded all the patricians, but also the plebeians who had no land; but the multitude was powerful enough to carry the point that its decree should have equal legal validity with that adopted by the centuries, in the event of its having been previously approved by the whole senate. That this last regulation had the force of established law before the issuing of the Twelve Tables, is certain; whether it was directly introduced on occasion of the Publilian -plebiscitum-, or whether it had already been called into existence by some other—now forgotten—statute, and was only applied to the Publilian -plebiscitum- cannot be any longer ascertained. In like manner it remains uncertain whether the number of tribunes was raised by this law from two to four, or whether that increase had taken place previously.

Agrarian Law of Spurius Cassius

More sagacious in plan than all these party steps was the attempt of Spurius Cassius to break down the financial omnipotence of the rich, and so to put a stop to the true source of the evil. He was a patrician, and none in his order surpassed him in rank and renown. After two triumphs, in his third consulate (268), he submitted to the burgesses a proposal to have the public domain measured and to lease part of it for the benefit of the public treasury, while a further portion was to be distributed among the necessitous. In other words, he attempted to wrest the control of the public lands from the senate, and, with the support of the burgesses, to put an end to the selfish system of occupation. He probably imagined that his personal distinction, and the equity and wisdom of the measure, might carry it even amidst that stormy sea of passion and of weakness. But he was mistaken. The nobles rose as one man; the rich plebeians took part with them; the commons were displeased because Spurius Cassius desired, in accordance with federal rights and equity, to give to the Latin confederates their share in the assignation. Cassius had to die. There is some truth in the charge that he had usurped regal power, for he had indeed endeavoured like the kings to protect the free commons against his own order. His law was buried along with him; but its spectre thenceforward incessantly haunted the eyes of the rich, and again and again it rose

from the tomb against them, until amidst the conflicts to which it led the commonwealth perished.

Page 256

Decemvirs

A further attempt was made to get rid of the tribunician power by securing to the plebeians equality of rights in a more regular and more effectual way. The tribune of the people, Gaius Terentilius Arsa, proposed in 292 the nomination of a commission of five men to prepare a general code of law by which the consuls should in future be bound in exercising their judicial powers. But the senate refused to sanction this proposal, and ten years elapsed ere it was carried into effect—years of vehement strife between the orders, and variously agitated moreover by wars and internal troubles. With equal obstinacy the party of the nobles hindered the concession of the law in the senate, and the plebs nominated again and again the same men as tribunes. Attempts were made to obviate the attack by other concessions. In the year 297 an increase of the tribunes from four to ten was sanctioned—a very dubious gain; and in the following year, by an Icilian -plebiscitum- which was admitted among the sworn privileges of the plebs, the Aventine, which had hitherto been a temple-grove and uninhabited, was distributed among the poorer burgesses as sites for buildings in heritable occupancy. The plebs took what was offered to them, but never ceased to insist in their demand for a legal code. At length, in the year 300, a compromise was effected; the senate in substance gave way. The preparation of a legal code was resolved upon; for that purpose, as an extraordinary measure, the centuries were to choose ten men who were at the same time to act as supreme magistrates in room of the consuls (-decemviri consulari imperio legibus scribundis-), and to this office not merely patricians, but plebeians also might be elected. These were here for the first time designated as eligible, though only for an extraordinary office. This was a great step in the progress towards full political equality; and it was not too dearly purchased, when the tribunate of the people as well as the right of appeal were suspended while the decemvirate lasted, and the decemvirs were simply bound not to infringe the sworn liberties of the community. Previously however an embassy was sent to Greece to bring home the laws of Solon and other Greek laws; and it was only on its return that the decemvirs were chosen for the year 303. Although they were at liberty to elect plebeians, the choice fell on patricians alone—so powerful was the nobility still—and it was only when a second election became necessary for 304, that some plebeians were chosen—the first non-patrician magistrates that the Roman community had.

Page 257

Taking a connected view of these measures, we can scarcely attribute to them any other design than that of substituting for tribunician intercession a limitation of the consular powers by written law. On both sides there must have been a conviction that things could not remain as they were, and the perpetuation of anarchy, while it ruined the commonwealth, was in reality of no benefit to any one. People in earnest could not but discern that the interference of the tribunes in administration and their action as prosecutors had an absolutely pernicious effect; and the only real gain which the tribunate brought to the plebeians was the protection which it afforded against a partial administration of justice, by operating as a sort of court of cassation to check the caprice of the magistrate. Beyond doubt, when the plebeians desired a written code, the patricians replied that in that event the legal protection of tribunes would be superfluous; and upon this there appears to have been concession by both sides. Perhaps there was never anything definitely expressed as to what was to be done after the drawing up of the code; but that the plebs definitely renounced the tribunate is not to be doubted, since it was brought by the decemvirate into such a position that it could not get back the tribunate otherwise than by illegal means. The promise given to the plebs that its sworn liberties should not be touched, may be referred to the rights of the plebeians independent of the tribunate, such as the *-provocatio-* and the possession of the Aventine. The intention seems to have been that the decemvirs should, on their retiring, propose to the people to re-elect the consuls who should now judge no longer according to their arbitrary pleasure but according to written law.

Legislation of the Twelve Tables

The plan, if it should stand, was a wise one; all depended on whether men's minds exasperated on either side with passion would accept that peaceful adjustment. The decemvirs of the year 303 submitted their law to the people, and it was confirmed by them, engraven on ten tables of copper, and affixed in the Forum to the rostra in front of the senate-house. But as a supplement appeared necessary, decemvirs were again nominated in the year 304, who added two more tables. Thus originated the first and only Roman code, the law of the Twelve Tables. It proceeded from a compromise between parties, and for that very reason could not well have contained any changes in the existing law of a comprehensive nature, going beyond the regulation of secondary matters and of the mere adaptation of means and ends. Even in the system of credit no further alleviation was introduced than the establishment of a—probably low—maximum of interest (10 per cent) and the threatening of heavy penalties against the usurer—penalties, characteristically enough, far heavier than those of the thief; the harsh procedure in actions of debt remained at least in its leading features unaltered.

Page 258

Still less, as may easily be conceived, were changes contemplated in the rights of the orders. On the contrary the legal distinction between burgesses liable to be taxed and those who were without estate, and the invalidity of marriage between patricians and plebeians, were confirmed anew in the law of the city. In like manner, with a view to restrict the caprice of the magistrate and to protect the burgess, it was expressly enacted that the later law should uniformly have precedence over the earlier, and that no decree of the people should be issued against a single burgess. The most remarkable feature was the exclusion of appeal to the -comitia tributa- in capital causes, while the privilege of appeal to the centuries was guaranteed; which admits of explanation from the circumstance that the penal jurisdiction was in fact usurped by the plebs and its presidents,(11) and with the tribunate there necessarily fell the tribunician capital process, while it was perhaps the intention to retain the aedilician process of fine (-multa-). The essential political significance of the measure resided far less in the contents of the legislation than in the formal obligation now laid upon the consuls to administer justice according to these forms of process and these rules of law, and in the public exhibition of the code, by which the administration of justice was subjected to the control of publicity and the consul was compelled to dispense equal and truly common justice to all.

Fall of the Decemvirs

The end of the decemvirate is involved in much obscurity. It only remained—so runs the story—for the decemvirs to publish the last two tables, and then to give place to the ordinary magistracy. But they delayed to do so: under the pretext that the laws were not yet ready, they themselves prolonged their magistracy after the expiry of their official year—which was so far possible, as under Roman constitutional law the magistracy called in an extraordinary way to the revision of the constitution could not become legally bound by the term set for its ending. The moderate section of the aristocracy, with the Valerii and Horatii at their head, are said to have attempted in the senate to compel the abdication of the decemvirate; but the head of the decemvirs Appius Claudius, originally a rigid aristocrat, but now changing into a demagogue and a tyrant, gained the ascendancy in the senate, and the people submitted. The levy of two armies was accomplished without opposition, and war was begun against the Volscians as well as against the Sabines. Thereupon the former tribune of the people, Lucius Siccius Dentatus, the bravest man in Rome, who had fought in a hundred and twenty battles and had forty-five honourable scars to show, was found dead in front of the camp, foully murdered, as it was said, at the instigation of the decemvirs. A revolution was fermenting in men's minds; and its outbreak was hastened by the unjust sentence pronounced

Page 259

by Appius in the process as to the freedom of the daughter of the centurion Lucius Verginius, the bride of the former tribune of the people Lucius Icilius—a sentence which wrested the maiden from her relatives with a view to make her non-free and beyond the pale of the law, and induced her father himself to plunge his knife into the heart of his daughter in the open Forum, to rescue her from certain shame. While the people in amazement at the unprecedented deed surrounded the dead body of the fair maiden, the decemvir commanded his lictors to bring the father and then the bridegroom before his tribunal, in order to render to him, from whose decision there lay no appeal, immediate account for their rebellion against his authority. The cup was now full. Protected by the furious multitude, the father and the bridegroom of the maiden made their escape from the lictors of the despot, and while the senate trembled and wavered in Rome, the pair presented themselves, with numerous witnesses of the fearful deed, in the two camps. The unparalleled tale was told; the eyes of all were opened to the gap which the absence of tribunician protection had made in the security of law; and what the fathers had done their sons repeated. Once more the armies abandoned their leaders: they marched in warlike order through the city, and proceeded once more to the Sacred Mount, where they again nominated their own tribunes. Still the decemvirs refused to lay down their power; then the army with its tribunes appeared in the city, and encamped on the Aventine. Now at length, when civil war was imminent and the conflict in the streets might hourly begin, the decemvirs renounced their usurped and dishonoured power; and the consuls Lucius Valerius and Marcus Horatius negotiated a second compromise, by which the tribunate of the plebs was again established. The impeachment of the decemvirs terminated in the two most guilty, Appius Claudius and Spurius Oppius, committing suicide in prison, while the other eight went into exile and the state confiscated their property. The prudent and moderate tribune of the plebs, Marcus Duilius, prevented further judicial prosecutions by a seasonable use of his veto.

So runs the story as recorded by the pen of the Roman aristocrats; but, even leaving out of view the accessory circumstances, the great crisis out of which the Twelve Tables arose cannot possibly have ended in such romantic adventures, and in political issues so incomprehensible. The decemvirate was, after the abolition of the monarchy and the institution of the tribunate of the people, the third great victory of the plebs; and the exasperation of the opposite party against the institution and against its head Appius Claudius is sufficiently intelligible. The plebeians had through its means secured the right of eligibility to the highest magistracy of the community and a general code of law; and it was not they that had reason to rebel against the new magistracy, and

Page 260

to restore the purely patrician consular government by force of arms. This end can only have been pursued by the party of the nobility, and if the patricio-plebeian decemvirs made the attempt to maintain themselves in office beyond their time, the nobility were certainly the first to enter the lists against them; on which occasion doubtless the nobles would not neglect to urge that the stipulated rights of the plebs should be curtailed and the tribunate, in particular, should be taken from it. If the nobility thereupon succeeded in setting aside the decemvirs, it is certainly conceivable that after their fall the plebs should once more assemble in arms with a view to secure the results both of the earlier revolution of 260 and of the latest movement; and the Valerio-Horatian laws of 305 can only be understood as forming a compromise in this conflict.

The Valerio-Horatian Laws

The compromise, as was natural, proved very favourable to the plebeians, and again imposed severely felt restrictions on the power of the nobility. As a matter of course the tribunate of the people was restored, the code of law wrung from the aristocracy was definitively retained, and the consuls were obliged to judge according to it. Through the code indeed the tribes lost their usurped jurisdiction in capital causes; but the tribunes got it back, as a way was found by which it was possible for them to transact business as to such cases with the centuries. Besides they retained, in the right to award fines without limitation and to submit this sentence to the -comitia tributa-, a sufficient means of putting an end to the civic existence of a patrician opponent. Further, it was on the proposition of the consuls decreed by the centuries that in future every magistrate—and therefore the dictator among the rest—should be bound at his nomination to allow the right of appeal: any one who should nominate a magistrate on other terms was to expiate the offence with his life. In other respects the dictator retained his former powers; and in particular his official acts could not, like those of the consuls, be cancelled by a tribune.

The plenitude of the consular power was further restricted in so far as the administration of the military chest was committed to two paymasters (-quaestores-) chosen by the community, who were nominated for the first time in 307. The nomination as well of the two new paymasters for war as of the two administering the city-chest now passed over to the community; the consul retained merely the conduct of the election instead of the election itself. The assembly in which the paymasters were elected was that of the whole patricio-plebeian freeholders, and voted by districts; an arrangement which likewise involved a concession to the plebeian farmers, who had far more command of these assemblies than of the centuriate -comitia-.

Page 261

A concession of still greater consequence was that which allowed the tribunes to share in the discussions of the senate. To admit the tribunes to the hall where the senate sat, appeared to that body beneath its dignity; so a bench was placed for them at the door that they might from that spot follow its proceedings. The tribunician right of intercession had extended also to the decrees of the senate as a collective body, after the latter had become not merely a deliberative but a decretory board, which probably occurred at first in the case of a -plebiscitum- that was meant to be binding for the whole community;(12) it was natural that there should thenceforth be conceded to the tribunes a certain participation in the discussions of the senate-house. In order also to secure the decrees of the senate— with the validity of which indeed that of the most important -plebiscita- was bound up—from being tampered with or forged, it was enacted that in future they should be deposited not merely under charge of the patrician -quaestores urbani- in the temple of Saturn, but also under that of the plebian aediles in the temple of Ceres. Thus this struggle, which was begun in order to get rid of the tribunician power, terminated in the renewed and now definitive sanctioning of its right to annul not only particular acts of administration on the appeal of the person aggrieved, but also any resolution of the constituent powers of the state at pleasure. The persons of the tribunes, and the uninterrupted maintenance of the college at its full number, were once more secured by the most sacred oaths and by every element of reverence that religion could present, and not less by the most formal laws. No attempt to abolish this magistracy was ever from this time forward made in Rome.

6. I. XI. Punishment of Offenses against Order
7. That the plebeian aediles were formed after the model of the patrician quaestors in the same way as the plebeian tribunes after the model of the patrician consuls, is evident both as regards their criminal functions (in which the distinction between the two magistracies seems to have lain in their tendencies only, not in their powers) and as regards their charge of the archives. The temple of Ceres was to the aediles what the temple of Saturn was to the quaestors, and from the former they derived their name. Significant in this respect is the enactment of the law of 305 (Liv. iii. 55), that the

decrees of the senate should be delivered over to the aediles there (p. 369), whereas, as is well known, according to the ancient —and subsequently after the settlement of the struggles between the orders, again preponderant—practice those decrees were committed to the quaestors for preservation in the temple of Saturn.

CHAPTER III

The Equalization of the Orders, and the New Aristocracy

Union of the Plebeians

The tribunician movements appear to have mainly originated in social rather than political discontent, and there is good reason to suppose that some of the wealthy plebeians admitted to the senate were no less opposed to these movements than the patricians. For they too benefited by the privileges against which the agitation was mainly directed; and although in other respects they found themselves treated as inferior, it probably seemed to them by no means an appropriate time for asserting their claim to participate in the magistracies, when the exclusive financial power of the whole senate was assailed. This explains why during the first fifty years of the republic no step was taken aiming directly at the political equalization of the orders.

But this league between the patricians and the wealthy plebeians by no means bore within itself any guarantee of permanence. Beyond doubt from the very first a portion of the leading plebeian families had attached themselves to the movement-party, partly from a sense of what was due to the fellow-members of their order, partly in consequence of the natural bond which unites all who are treated as inferior, and partly because they perceived that concessions to the multitude were inevitable in the issue, and that, if turned to due account, they would result in the abrogation of the exclusive rights of the patriciate and would thereby give to the plebeian aristocracy a decisive preponderance in the state. Should this conviction become—as was inevitable—more and more prevalent, and should the plebeian aristocracy at the head of its order take up the struggle with the patrician nobility, it would wield in the tribunate a legalized instrument of civil warfare, and it might, with the weapon of social distress, so fight its battles as to dictate to the nobility the terms of peace and, in the position of mediator between the two parties, compel its own admission to the offices of state.

Such a crisis in the position of parties occurred after the fall of the decemvirate. It had now become perfectly clear that the tribunate of the plebs could never be set aside; the

plebeian aristocracy could not do better than seize this powerful lever and employ it for the removal of the political disabilities of their order.

Throwing Open of Marriage and of Magistracies—
Military Tribunes with Consular Powers

Page 263

Nothing shows so clearly the defencelessness of the clan-nobility when opposed to the united plebs, as the fact that the fundamental principle of the exclusive party—the invalidity of marriage between patricians and plebeians—fell at the first blow scarcely four years after the decemviral revolution. In the year 309 it was enacted by the Canuleian plebiscite, that a marriage between a patrician and a plebeian should be valid as a true Roman marriage, and that the children begotten of such a marriage should follow the rank of the father. At the same time it was further carried that, in place of consuls, military tribunes—of these there were at that time, before the division of the army into legions, six, and the number of these magistrates was adjusted accordingly—with consular powers⁽¹⁾ and consular duration of office should be elected by the centuries. The proximate cause was of a military nature, as the various wars required a greater number of generals in chief command than the consular constitution allowed; but the change came to be of essential importance for the conflicts of the orders, and it may be that that military object was rather the pretext than the reason for this arrangement. According to the ancient law every burgess or —*metoikos*— liable to service might attain the post of an officer,⁽²⁾ and in virtue of that principle the supreme magistracy, after having been temporarily opened up to the plebeians in the decemvirate, was now after a more comprehensive fashion rendered equally accessible to all freeborn burgesses. The question naturally occurs, what interest the aristocracy could have—now that it was under the necessity of abandoning its exclusive possession of the supreme magistracy and of yielding in the matter—in refusing to the plebeians the title, and conceding to them the consulate under this singular form?⁽³⁾ But, in the first place, there were associated with the holding of the supreme magistracy various honorary rights, partly personal, partly hereditary; thus the honour of a triumph was regarded as legally dependent on the occupancy of the supreme magistracy, and was never given to an officer who had not administered the latter office in person; and the descendants of a curule magistrate were at liberty to set up the image of such an ancestor in the family hall and to exhibit it in public on fitting occasions, while this was not allowed in the case of other ancestors.⁽⁴⁾ It is as easy to be explained as it is difficult to be vindicated, that the governing aristocratic order should have allowed the government itself to be wrested from their hands far sooner than the honorary rights associated with it, especially such as were hereditary; and therefore, when it was obliged to share the former with the plebeians, it gave to the actual supreme magistrate the legal standing not of the holder of a curule chair, but of a simple staff-officer, whose distinction was one purely personal. Of greater political importance,

Page 264

however, than the refusal of the -ius imaginum- and of the honour of a triumph was the circumstance, that the exclusion of the plebeians sitting in the senate from debate necessarily ceased in respect to those of their number who, as designated or former consuls, ranked among the senators whose opinion had to be asked before the rest; so far it was certainly of great importance for the nobility to admit the plebeian only to a consular office, and not to the consulate itself.

Opposition of the Patriciate

But notwithstanding these vexatious disabilities the privileges of the clans, so far as they had a political value, were legally superseded by the new institution; and, had the Roman nobility been worthy of its name, it must now have given up the struggle. But it did not. Though a rational and legal resistance was thenceforth impossible, spiteful opposition still found a wide field of petty expedients, of chicanery and intrigue; and, far from honourable or politically prudent as such resistance was, it was still in a certain sense fruitful of results. It certainly procured at length for the commons concessions which could not easily have been wrung from the united Roman aristocracy; but it also prolonged civil war for another century and enabled the nobility, in defiance of those laws, practically to retain the government in their exclusive possession for several generations longer.

Their Expedients

The expedients of which the nobility availed themselves were as various as political paltriness could suggest. Instead of deciding at once the question as to the admission or exclusion of the plebeians at the elections, they conceded what they were compelled to concede only with reference to the elections immediately impending. The vain struggle was thus annually renewed whether patrician consuls or military tribunes from both orders with consular powers should be nominated; and among the weapons of the aristocracy this mode of conquering an opponent by wearying and annoying him proved by no means the least effective.

Subdivision of the Magistracy— Censorship

Moreover they broke up the supreme power which had hitherto been undivided, in order to delay their inevitable defeat by multiplying the points to be assailed. Thus the adjustment of the budget and of the burgess—and taxation-rolls, which ordinarily took place every fourth year and had hitherto been managed by the consuls, was entrusted as early as the year 319 to two valuers (-censores-), nominated by the centuries from among the nobles for a period, at the most, of eighteen months. The new office gradually became the palladium of the aristocratic party, not so much on account of its

financial influence as on account of the right annexed to it of filling up the vacancies in the senate and in the equites, and of removing individuals from the lists of the senate, equites, and burgesses on occasion of their adjustment. At this epoch, however, the censorship by no means possessed the great importance and moral supremacy which afterwards were associated with it.

Page 265

Quaestorship

But the important change made in the year 333 in respect to the quaestorship amply compensated for this success of the patrician party. The patricio-plebeian assembly of the tribes—perhaps taking up the ground that at least the two military paymasters were in fact officers rather than civil functionaries, and that so far the plebeian appeared as well entitled to the quaestorship as to the military tribuneship—carried the point that plebeian candidates also were admitted for the quaestorial elections, and thereby acquired for the first time the privilege of eligibility as well as the right of election for one of the ordinary magistracies. With justice it was felt on the one side as a great victory, on the other as a severe defeat, that thenceforth patrician and plebeian were equally capable of electing and being elected to the military as well as to the urban quaestorship.

Attempts at Counterrevolution

The nobility, in spite of the most obstinate resistance, only sustained loss after loss; and their exasperation increased as their power decreased. Attempts were doubtless still made directly to assail the rights secured by agreement to the commons; but such attempts were not so much the well-calculated manoeuvres of party as the acts of an impotent thirst for vengeance. Such in particular was the process against Maelius as reported by the tradition—certainly not very trustworthy—that has come down to us. Spurius Maelius, a wealthy plebeian, during a severe dearth (315) sold corn at such prices as to put to shame and annoy the patrician store-president (-praefectus annonae-) Gaius Minucius. The latter accused him of aspiring to kingly power; with what amount of reason we cannot decide, but it is scarcely credible that a man who had not even filled the tribunate should have seriously thought of sovereignty. Nevertheless the authorities took up the matter in earnest, and the cry of “King” always produced on the multitude in Rome an effect similar to that of the cry of “Pope” on the masses in England. Titus Quinctius Capitolinus, who was for the sixth time consul, nominated Lucius Quinctius Cincinnatus, who was eighty years of age, as dictator without appeal, in open violation of the solemnly sworn laws.⁽⁵⁾ Maelius, summoned before him, seemed disposed to disregard the summons; and the dictator’s master of the horse, Gaius Servilius Ahala, slew him with his own hand. The house of the murdered man was pulled down, the corn from his granaries was distributed gratuitously to the people, and those who threatened to avenge his death were secretly made away with. This disgraceful judicial murder—a disgrace even more to the credulous and blind people than to the malignant party of young patricians—passed unpunished; but if that party had hoped by such means to undermine the right of appeal, it violated the laws and shed innocent blood in vain.

Intrigues of the Nobility

Page 266

Electioneering intrigues and priestly trickery proved in the hands of the nobility more efficient than any other weapons. The extent to which the former must have prevailed is best seen in the fact that in 322 it appeared necessary to issue a special law against electioneering practices, which of course was of little avail. When the voters could not be influenced by corruption or threatening, the presiding magistrates stretched their powers—admitting, for example, so many plebeian candidates that the votes of the opposition were thrown away amongst them, or omitting from the list of candidates those whom the majority were disposed to choose. If in spite of all this an obnoxious election was carried, the priests were consulted whether no vitiating circumstance had occurred in the auspices or other religious ceremonies on the occasion; and some such flaw they seldom failed to discover. Taking no thought as to the consequences and unmindful of the wise example of their ancestors, the people allowed the principle to be established that the opinion of the skilled colleges of priests as to omens of birds, portents, and the like was legally binding on the magistrate, and thus put it into their power to cancel any state-act—whether the consecration of a temple or any other act of administration, whether law or election—on the ground of religious informality. In this way it became possible that, although the eligibility of plebeians had been established by law already in 333 for the quaestorship and thenceforward continued to be legally recognized, it was only in 345 that the first plebeian attained the quaestorship; in like manner patricians almost exclusively held the military tribunate with consular powers down to 354. It was apparent that the legal abolition of the privileges of the nobles had by no means really and practically placed the plebeian aristocracy on a footing of equality with the clan-nobility. Many causes contributed to this result: the tenacious opposition of the nobility far more easily allowed itself to be theoretically superseded in a moment of excitement, than to be permanently kept down in the annually recurring elections; but the main cause was the inward disunion between the chiefs of the plebeian aristocracy and the mass of the farmers. The middle class, whose votes were decisive in the comitia, did not feel itself specially called on to advance the interests of genteel non-patricians, so long as its own demands were disregarded by the plebeian no less than by the patrician aristocracy.

The Suffering Farmers

During these political struggles social questions had lain on the whole dormant, or were discussed at any rate with less energy. After the plebeian aristocracy had gained possession of the tribunate for its own ends, no serious notice was taken either of the question of the domains or of a reform in the system of credit; although there was no lack either of newly acquired lands or of impoverished or decaying

Page 267

farmers. Instances indeed of assignments took place, particularly in the recently conquered border-territories, such as those of the domain of Ardea in 312, of Labici in 336, and of Veii in 361—more however on military grounds than for the relief of the farmer, and by no means to an adequate extent. Individual tribunes doubtless attempted to revive the law of Cassius—for instance Spurius Maecilius and Spurius Metilius instituted in the year 337 a proposal for the distribution of the whole state-lands—but they were thwarted, in a manner characteristic of the existing state of parties, by the opposition of their own colleagues or in other words of the plebeian aristocracy. Some of the patricians also attempted to remedy the common distress; but with no better success than had formerly attended Spurius Cassius. A patrician like Cassius and like him distinguished by military renown and personal valour, Marcus Manlius, the saviour of the Capitol during the Gallic siege, is said to have come forward as the champion of the oppressed people, with whom he was connected by the ties of comradeship in war and of bitter hatred towards his rival, the celebrated general and leader of the optimate party, Marcus Furius Camillus. When a brave officer was about to be led away to a debtor's prison, Manlius interceded for him and released him with his own money; at the same time he offered his lands to sale, declaring loudly that, as long as he possessed a foot's breadth of land, such iniquities should not occur. This was more than enough to unite the whole government party, patricians as well as plebeians, against the dangerous innovator. The trial for high treason, the charge of having meditated a renewal of the monarchy, wrought on the blind multitude with the insidious charm which belongs to stereotyped party-phrases. They themselves condemned him to death, and his renown availed him nothing save that it was deemed expedient to assemble the people for the bloody assize at a spot whence the voters could not see the rock of the citadel—the dumb monitor which might remind them how their fatherland had been saved from the extremity of danger by the hands of the very man whom they were now consigning to the executioner (370).

While the attempts at reformation were thus arrested in the bud, the social disorders became still more crying; for on the one hand the domain-possession was ever extending in consequence of successful wars, and on the other hand debt and impoverishment were ever spreading more widely among the farmers, particularly from the effects of the severe war with Veii (348-358) and of the burning of the capital in the Gallic invasion (364). It is true that, when in the Veientine war it became necessary to prolong the term of service of the soldiers and to keep them under arms not—as hitherto at the utmost—only during summer, but also throughout the winter, and when the farmers, foreseeing their utter economic ruin, were on the point

Page 268

of refusing their consent to the declaration of war, the senate resolved on making an important concession. It charged the pay, which hitherto the tribes had defrayed by contribution, on the state-chest, or in other words, on the produce of the indirect revenues and the domains (348). It was only in the event of the state-chest being at the moment empty that a general contribution (-tributum-) was imposed on account of the pay; and in that case it was considered as a forced loan and was afterwards repaid by the community. The arrangement was equitable and wise; but, as it was not placed upon the essential foundation of turning the domains to proper account for the benefit of the exchequer, there were added to the increased burden of service frequent contributions, which were none the less ruinous to the man of small means that they were officially regarded not as taxes but as advances.

Combination of the Plebeian Aristocracy and the Farmers against the Nobility— Licinio-Sextian Laws

Under such circumstances, when the plebeian aristocracy saw itself practically excluded by the opposition of the nobility and the indifference of the commons from equality of political rights, and the suffering farmers were powerless as opposed to the close aristocracy, it was natural that they should help each other by a compromise. With this view the tribunes of the people, Gaius Licinius and Lucius Sextius, submitted to the commons proposals to the following effect: first, to abolish the consular tribunate; secondly, to lay it down as a rule that at least one of the consuls should be a plebeian; thirdly, to open up to the plebeians admission to one of the three great colleges of priests—that of the custodiers of oracles, whose number was to be increased to ten (-duoviri-, afterwards -decemviri sacris faciundis-(6)); fourthly, as respected the domains, to allow no burgess to maintain upon the common pasture more than a hundred oxen and five hundred sheep, or to hold more than five hundred -jugera- (about 300 acres) of the domain lands left free for occupation; fifthly, to oblige the landlords to employ in the labours of the field a number of free labourers proportioned to that of their rural slaves; and lastly, to procure alleviation for debtors by deduction of the interest which had been paid from the capital, and by the arrangement of set terms for the payment of arrears.

The tendency of these enactments is obvious. They were designed to deprive the nobles of their exclusive possession of the curule magistracies and of the hereditary distinctions of nobility therewith associated; which, it was characteristically conceived, could only be accomplished by the legal exclusion of the nobles from the place of second consul. They were designed, as a consequence, to emancipate the plebeian members of the senate from the subordinate position which they occupied as silent by-sitters,(7) in so far as those of them at least who had filled

Page 269

the consulate thereby acquired a title to deliver their opinion with the patrician consulars before the other patrician senators.(8) They were intended, moreover, to withdraw from the nobles the exclusive possession of spiritual dignities; and in carrying out this purpose for reasons sufficiently obvious the old Latin priesthods of the augurs and Pontifices were left to the old burgesses, but these were obliged to open up to the new burgesses the third great college of more recent origin and belonging to a worship that was originally foreign. They were intended, in fine, to procure a share in the common usufructs of burgesses for the poorer commons, alleviation for the suffering debtors, and employment for the day-labourers that were destitute of work. Abolition of privileges, civil equality, social reform—these were the three great ideas, of which it was the design of this movement to secure the recognition. Vainly the patricians exerted all the means at their command in opposition to these legislative proposals; even the dictatorship and the old military hero Camillus were able only to delay, not to avert their accomplishment. Willingly would the people have separated the proposals; of what moment to it were the consulate and custodianship of oracles, if only the burden of debt were lightened and the public lands were free! But it was not for nothing that the plebeian nobility had adopted the popular cause; it included the proposals in one single project of law, and after a long struggle—it is said of eleven years—the senate at length gave its consent and they passed in the year 387.

Political Abolition of the Patriciate

With the election of the first non-patrician consul—the choice fell on one of the authors of this reform, the late tribune of the people, Lucius Sextius Lateranus—the clan-aristocracy ceased both in fact and in law to be numbered among the political institutions of Rome. When after the final passing of these laws the former champion of the clans, Marcus Furius Camillus, founded a sanctuary of Concord at the foot of the Capitol—upon an elevated platform, where the senate was wont frequently to meet, above the old meeting-place of the burgesses, the Comitium—we gladly cherish the belief that he recognized in the legislation thus completed the close of a dissension only too long continued. The religious consecration of the new concord of the community was the last public act of the old warrior and statesman, and a worthy termination of his long and glorious career. He was not wholly mistaken; the more judicious portion of the clans evidently from this time forward looked upon their exclusive political privileges as lost, and were content to share the government with the plebeian aristocracy. In the majority, however, the patrician spirit proved true to its incorrigible character. On the strength of the privilege which the champions of legitimacy have at all times claimed of obeying the laws only

Page 270

when these coincide with their party interests, the Roman nobles on various occasions ventured, in open violation of the stipulated arrangement, to nominate two patrician consuls. But, when by way of answer to an election of that sort for the year 411 the community in the year following formally resolved to allow both consular positions to be filled by non-patricians, they understood the implied threat, and still doubtless desired, but never again ventured, to touch the second consular place.

Praetorship—

Curule Aedileship—

Complete Opening Up of Magistracies and Priesthoods

In like manner the aristocracy simply injured itself by the attempt which it made, on the passing of the Licinian laws, to save at least some remnant of its ancient privileges by means of a system of political clipping and paring. Under the pretext that the nobility were exclusively cognizant of law, the administration of justice was detached from the consulate when the latter had to be thrown open to the plebeians; and for this purpose there was nominated a special third consul, or, as he was commonly called, a praetor. In like manner the supervision of the market and the judicial police-duties connected with it, as well as the celebration of the city-festival, were assigned to two newly nominated aediles, who—by way of distinction from the plebeian aediles—were named from their standing jurisdiction “aediles of the judgment seat” (-aediles curules-). But the curule aedileship became immediately so far accessible to the plebeians, that it was held by patricians and plebeians alternately. Moreover the dictatorship was thrown open to plebeians in 398, as the mastership of the horse had already been in the year before the Licinian laws (386); both the censorships were thrown open in 403, and the praetorship in 417; and about the same time (415) the nobility were by law excluded from one of the censorships, as they had previously been from one of the consulships. It was to no purpose that once more a patrician augur detected secret flaws, hidden from the eyes of the uninitiated, in the election of a plebeian dictator (427), and that the patrician censor did not up to the close of our present period (474) permit his colleague to present the solemn sacrifice with which the census closed; such chicanery served merely to show the ill humour of patricianism. Of as little avail were the complaints which the patrician presidents of the senate would not fail to raise regarding the participation of the plebeians in its debates; it became a settled rule that no longer the patrician members, but those who had attained to one of the three supreme ordinary magistracies—the consulship, praetorship, and curule aedileship—should be summoned to give their opinion in this order and without distinction of class, while the senators who had held none of these offices still even now took part merely in the division. The right, in fine, of the patrician senate to reject

Page 271

a decree of the community as unconstitutional—a right, however, which in all probability it rarely ventured to exercise—was withdrawn from it by the Publilian law of 415 and by the Maenian law which was not passed before the middle of the fifth century, in so far that it had to bring forward its constitutional objections, if it had any such, when the list of candidates was exhibited or the project of law was brought in; which practically amounted to a regular announcement of its consent beforehand. In this character, as a purely formal right, the confirmation of the decrees of the people still continued in the hands of the nobility down to the last age of the republic.

The clans retained, as may naturally be conceived, their religious privileges longer. Indeed, several of these, which were destitute of political importance, were never interfered with, such as their exclusive eligibility to the offices of the three supreme -flamines-and that of -rex sacrorum- as well as to the membership of the colleges of Salii. On the other hand the two colleges of Pontifices and of augurs, with which a considerable influence over the courts and the comitia were associated, were too important to remain in the exclusive possession of the patricians. The Ogulnian law of 454 accordingly threw these also open to plebeians, by increasing the number both of the pontifices and of the augurs from six to nine, and equally distributing the stalls in the two colleges between patricians and plebeians.

Equivalence of Law and Plebiscitum

The two hundred years' strife was brought at length to: a close by the law of the dictator Q. Hortensius (465, 468) which was occasioned by a dangerous popular insurrection, and which declared that the decrees of the plebs should stand on an absolute footing of equality—instead of their earlier conditional equivalence—with those of the whole community. So greatly had the state of things been changed that that portion of the burgesses which had once possessed exclusively the right of voting was thenceforth, under the usual form of taking votes binding for the whole burgess-body, no longer so much as asked the question.

The Later Patricianism

The struggle between the Roman clans and commons was thus substantially at an end. While the nobility still preserved out of its comprehensive privileges the -de facto- possession of one of the consulships and one of the censorships, it was excluded by law from the tribunate, the plebeian aedileship, the second consulship and censorship, and from participation in the votes of the plebs which were legally equivalent to votes of the whole body of burgesses. As a righteous retribution for its perverse and stubborn resistance, the patriciate had seen its former privileges converted into so many disabilities. The Roman clan-nobility, however, by no means disappeared because it

had become an empty name. The less the significance and power of the nobility, the more purely and exclusively

Page 272

the patrician spirit developed itself. The haughtiness of the “Ramnians” survived the last of their class-privileges for centuries; after they had steadfastly striven “to rescue the consulate from the plebeian filth” and had at length become reluctantly convinced of the impossibility of such an achievement, they continued at least rudely and spitefully to display their aristocratic spirit. To understand rightly the history of Rome in the fifth and sixth centuries, we must never overlook this sulking patricianism; it could indeed do little more than irritate itself and others, but this it did to the best of its ability. Some years after the passing of the Ogulnian law (458) a characteristic instance of this sort occurred. A patrician matron, who was married to a leading plebeian that had attained to the highest dignities of the state, was on account of this misalliance expelled from the circle of noble dames and was refused admission to the common festival of Chastity; and in consequence of that exclusion separate patrician and plebeian goddesses of Chastity were thenceforward worshipped in Rome. Doubtless caprices of this sort were of very little moment, and the better portion of the clans kept themselves entirely aloof from this miserable policy of peevishness; but it left behind on both sides a feeling of discontent, and, while the struggle of the commons against the clans was in itself a political and even moral necessity, these convulsive efforts to prolong the strife—the aimless combats of the rear-guard after the battle had been decided, as well as the empty squabbles as to rank and standing—needlessly irritated and disturbed the public and private life of the Roman community.

The Social Distress, and the Attempt to Relieve It

Nevertheless one object of the compromise concluded by the two portions of the plebs in 387, the abolition of the patriciate, had in all material points been completely attained. The question next arises, how far the same can be affirmed of the two positive objects aimed at in the compromise?—whether the new order of things in reality checked social distress and established political equality? The two were intimately connected; for, if economic embarrassments ruined the middle class and broke up the burgesses into a minority of rich men and a suffering proletariat, such a state of things would at once annihilate civil equality and in reality destroy the republican commonwealth. The preservation and increase of the middle class, and in particular of the farmers, formed therefore for every patriotic statesman of Rome a problem not merely important, but the most important of all. The plebeians, moreover, recently called to take part in the government, greatly indebted as they were for their new political rights to the proletariat which was suffering and expecting help at their hands, were politically and morally under special obligation to attempt its relief by means of government measures, so far as relief was by such means at all attainable.

Page 273

The Licinian Agrarian Laws

Let us first consider how far any real relief was contained in that part of the legislation of 387 which bore upon the question. That the enactment in favour of the free day-labourers could not possibly accomplish its object—namely, to check the system of farming on a large scale and by means of slaves, and to secure to the free proletarians at least a share of work—is self-evident. In this matter legislation could afford no relief, without shaking the foundations of the civil organization of the period in a way that would reach far beyond its immediate horizon. In the question of the domains, on the other hand, it was quite possible for legislation to effect a change; but what was done was manifestly inadequate. The new domain-arrangement, by granting the right of driving very considerable flocks and herds upon the public pastures, and that of occupying domain-land not laid out in pasture up to a maximum fixed on a high scale, conceded to the wealthy an important and perhaps even disproportionate prior share in the produce of the domains; and by the latter regulation conferred upon the domain-tenure, although it remained in law liable to pay a tenth and revocable at pleasure, as well as upon the system of occupation itself, somewhat of a legal sanction. It was a circumstance still more suspicious, that the new legislation neither supplemented the existing and manifestly unsatisfactory provisions for the collection of the pasture-money and the tenth by compulsory measures of a more effective kind, nor prescribed any thorough revision of the domanial possessions, nor appointed a magistracy charged with the carrying of the new laws into effect. The distribution of the existing occupied domain-land partly among the holders up to a fair maximum, partly among the plebeians who had no property, in both cases in full ownership; the abolition in future of the system of occupation; and the institution of an authority empowered to make immediate distribution of any future acquisitions of territory, were so clearly demanded by the circumstances of the case, that it certainly was not through want of discernment that these comprehensive measures were neglected. We cannot fail to recollect that it was the plebeian aristocracy, in other words, a portion of the very class that was practically privileged in respect to the usufructs of the domains, which proposed the new arrangement, and that one of its very authors, Gaius Licinius Stolo, was among the first to be condemned for having exceeded the agrarian maximum; and we cannot but ask whether the legislators dealt altogether honourably, and whether they did not on the contrary designedly evade a solution, really tending to the common benefit, of the unhappy question of the domains. We do not mean, however, to express any doubt that the regulations of the Licinian laws, such as they were, might and did substantially benefit the small farmer and the day-labourer. It must, moreover, be acknowledged that in the period immediately succeeding the passing of the law the authorities watched with at least comparative strictness over the observance of its rules as to the maximum, and frequently condemned the possessors of large herds and the occupiers of the domains to heavy fines.

Page 274

Laws Imposing Taxes— Laws of Credit

In the system of taxation and of credit also efforts were made with greater energy at this period than at any before or subsequent to it to remedy the evils of the national economy, so far as legal measures could do so. The duty levied in 397 of five per cent on the value of slaves that were to be manumitted was—irrespective of the fact that it imposed a check on the undesirable multiplication of freedmen—the first tax in Rome that was really laid upon the rich. In like manner efforts were made to remedy the system of credit. The usury laws, which the Twelve Tables had established,(9) were renewed and gradually rendered more stringent, so that the maximum of interest was successively lowered from 10 per cent (enforced in 397) to 5 per cent (in 407) for the year of twelve months, and at length (412) the taking of interest was altogether forbidden. The latter foolish law remained formally in force, but, of course, it was practically inoperative; the standard rate of interest afterwards usual, *viz.* 1 per cent per month, or 12 per cent for the civil common year—which, according to the value of money in antiquity, was probably at that time nearly the same as, according to its modern value, a rate of 5 or 6 per cent—must have been already about this period established as the maximum of appropriate interest. Any action at law for higher rates must have been refused, perhaps even judicial claims for repayment may have been allowed; moreover notorious usurers were not unfrequently summoned before the bar of the people and readily condemned by the tribes to heavy fines. Still more important was the alteration of the procedure in cases of debt by the Poetelian law (428 or 441). On the one hand it allowed every debtor who declared on oath his solvency to save his personal freedom by the cession of his property; on the other hand it abolished the former summary proceedings in execution on a loan-debt, and laid down the rule that no Roman burgess could be led away to bondage except upon the sentence of jurymen.

Continued Distress

It is plain that all these expedients might perhaps in some respects mitigate, but could not remove, the existing economic disorders. The continuance of the distress is shown by the appointment of a bank-commission to regulate the relations of credit and to provide advances from the state-chest in 402, by the fixing of legal payment by instalments in 407, and above all by the dangerous popular insurrection about 467, when the people, unable to obtain new facilities for the payment of debts, marched out to the Janiculum, and nothing but a seasonable attack by external enemies, and the concessions contained in the Hortensian law,(10) restored peace to the community. It is, however, very unjust to reproach these earnest attempts to check the impoverishment of the middle class with their inadequacy. The belief that it is useless to

Page 275

employ partial and palliative means against radical evils, because they only remedy them in part, is an article of faith never preached unsuccessfully by baseness to simplicity, but it is none the less absurd. On the contrary, we may ask whether the vile spirit of demagogism had not even thus early laid hold of this matter, and whether expedients were really needed so violent and dangerous as, for example, the deduction of the interest paid from the capital. Our documents do not enable us to decide the question of right or wrong in the case. But we recognize clearly enough that the middle class of freeholders still continued economically in a perilous and critical position; that various endeavours were made by those in power to remedy it by prohibitory laws and by respites, but of course in vain; and that the aristocratic ruling class continued to be too weak in point of control over its members, and too much entangled in the selfish interests of its order, to relieve the middle class by the only effectual means at the disposal of the government—the entire and unreserved abolition of the system of occupying the state-lands—and by that course to free the government from the reproach of turning to its own advantage the oppressed position of the governed.

Influence of the Extension of the Roman Dominion in Elevating the Farmer-Class

A more effectual relief than any which the government was willing or able to give was derived by the middle classes from the political successes of the Roman community and the gradual consolidation of the Roman sovereignty over Italy. The numerous and large colonies which it was necessary to found for the securing of that sovereignty, the greater part of which were sent forth in the fifth century, furnished a portion of the agricultural proletariat with farms of their own, while the efflux gave relief to such as remained at home. The increase of the indirect and extraordinary sources of revenue, and the flourishing condition of the Roman finances in general, rendered it but seldom necessary to levy any contribution from the farmers in the form of a forced loan. While the earlier small holdings were probably lost beyond recovery, the rising average of Roman prosperity must have converted the former larger landholders into farmers, and in so far added new members to the middle class. People of rank sought principally to secure the large newly-acquired districts for occupation; the mass of wealth which flowed to Rome through war and commerce must have reduced the rate of interest; the increase in the population of the capital benefited the farmer throughout Latium; a wise system of incorporation united a number of neighbouring and formerly subject communities with the Roman state, and thereby strengthened especially the middle class; finally, the glorious victories and their mighty results silenced faction. If the distress of the farmers was by no means removed and still less were its sources stopped, it yet admits of no doubt that at the close of this period the Roman middle class was on the whole in a far less oppressed condition than in the first century after the expulsion of the kings.

Page 276

Civic Equality

Lastly civic equality was in a certain sense undoubtedly attained or rather restored by the reform of 387, and the development of its legitimate consequences. As formerly, when the patricians still in fact formed the burgesses, these had stood upon a footing of absolute equality in rights and duties, so now in the enlarged burgess-body there existed in the eye of the law no arbitrary distinctions. The gradations to which differences of age, sagacity, cultivation, and wealth necessarily give rise in civil society, naturally also pervaded the sphere of public life; but the spirit animating the burgesses and the policy of the government uniformly operated so as to render these differences as little conspicuous as possible. The whole system of Rome tended to train up her burgesses on an average as sound and capable, but not to bring into prominence the gifts of genius. The growth of culture among the Romans did not at all keep pace with the development of the power of their community, and it was instinctively repressed rather than promoted by those in power. That there should be rich and poor, could not be prevented; but (as in a genuine community of farmers) the farmer as well as the day-labourer personally guided the plough, and even for the rich the good economic rule held good that they should live with uniform frugality and above all should hoard no unproductive capital at home—excepting the salt-cellar and the sacrificial ladle, no silver articles were at this period seen in any Roman house. Nor was this of little moment. In the mighty successes which the Roman community externally achieved during the century from the last Veientine down to the Pyrrhic war we perceive that the patriciate has now given place to the farmers; that the fall of the highborn Fabian would have been not more and not less lamented by the whole community than the fall of the plebeian Decian was lamented alike by plebeians and patricians; that the consulate did not of itself fall even to the wealthiest aristocrat; and that a poor husbandman from Sabina, Manius Curius, could conquer king Pyrrhus in the field of battle and chase him out of Italy, without ceasing to be a simple Sabine farmer and to cultivate in person his own bread-corn.

New Aristocracy

In regard however to this imposing republican equality we must not overlook the fact that it was to a considerable extent only formal, and that an aristocracy of a very decided stamp grew out of it or rather was contained in it from the very first. The non-patrician families of wealth and consideration had long ago separated from the plebs, and leagued themselves with the patriciate in the participation of senatorial rights and in the prosecution of a policy distinct from that of the plebs and very often counteracting it. The Licinian laws abrogated the legal distinctions within the ranks of the aristocracy, and changed the character of the barrier which excluded the plebeian from the government,

Page 277

so that it was no longer a hindrance unalterable in law, but one, not indeed insurmountable, but yet difficult to be surmounted in practice. In both ways fresh blood was mingled with the ruling order in Rome; but in itself the government still remained, as before, aristocratic. In this respect the Roman community was a genuine farmer-commonwealth, in which the rich holder of a whole hide was little distinguished externally from the poor cottager and held intercourse with him on equal terms, but aristocracy nevertheless exercised so all-powerful a sway that a man without means far sooner rose to be master of the burgesses in the city than mayor in his own village. It was a very great and valuable gain, that under the new legislation even the poorest burgess might fill the highest office of the state; nevertheless it was a rare exception when a man from the lower ranks of the population reached such a position,(11) and not only so, but probably it was, at least towards the close of this period, possible only by means of an election carried by the opposition.

New Opposition

Every aristocratic government of itself calls forth a corresponding opposition party; and as the formal equalization of the orders only modified the aristocracy, and the new ruling order not only succeeded the old patriciate but engrafted itself on it and intimately coalesced with it, the opposition also continued to exist and in all respects pursued a similar course. As it was now no longer the plebeian burgesses as such, but the common people, that were treated as inferior, the new opposition professed from the first to be the representative of the lower classes and particularly of the small farmers; and as the new aristocracy attached itself to the patriciate, so the first movements of this new opposition were interwoven with the final struggles against the privileges of the patricians. The first names in the series of these new Roman popular leaders were Manius Curius (consul 464, 479, 480; censor 481) and Gaius Fabricius (consul 472, 476, 481; censor 479); both of them men without ancestral lineage and without wealth, both summoned—in opposition to the aristocratic principle of restricting re-election to the highest office of the state—thrice by the votes of the burgesses to the chief magistracy, both, as tribunes, consuls, and censors, opponents of patrician privileges and defenders of the small farmer-class against the incipient arrogance of the leading houses. The future parties were already marked out; but the interests of party were still suspended on both sides in presence of the interests of the commonweal. The patrician Appius Claudius and the farmer Manius Curius—vehement in their personal antagonism—jointly by wise counsel and vigorous action conquered king Pyrrhus; and while Gaius Fabricius as censor inflicted penalties on Publius Cornelius Rufinus for his aristocratic sentiments and aristocratic habits, this did not prevent him from supporting the claim of Rufinus to a second consulate on account of his recognized ability as a general. The breach was already formed; but the adversaries still shook hands across it.

Page 278

The New Government

The termination of the struggles between the old and new burgesses, the various and comparatively successful endeavours to relieve the middle class, and the germs—already making their appearance amidst the newly acquired civic equality—of the formation of a new aristocratic and a new democratic party, have thus been passed in review. It remains that we describe the shape which the new government assumed amidst these changes, and the positions in which after the political abolition of the nobility the three elements of the republican commonwealth—the burgesses, the magistrates, and the senate—stood towards each other.

The Burgess-Body— Its Composition

The burgesses in their ordinary assemblies continued as hitherto to be the highest authority in the commonwealth and the legal sovereign. But it was settled by law that—apart from the matters committed once for all to the decision of the centuries, such as the election of consuls and censors—voting by districts should be just as valid as voting by centuries: a regulation introduced as regards the patricio-plebeian assembly by the Valerio-Horatian law of 305(12) and extended by the Publilian law of 415, but enacted as regards the plebeian separate assembly by the Hortensian law about 467.(13) We have already noticed that the same individuals, on the whole, were entitled to vote in both assemblies, but that—apart from the exclusion of the patricians from the plebeian separate assembly—in the general assembly of the districts all entitled to vote were on a footing of equality, while in the centuriate comitia the working of the suffrage was graduated with reference to the means of the voters, and in so far, therefore, the change was certainly a levelling and democratic innovation. It was a circumstance of far greater importance that, towards the end of this period, the primitive freehold basis of the right of suffrage began for the first time to be called in question. Appius Claudius, the boldest innovator known in Roman history, in his censorship in 442 without consulting the senate or people so adjusted the burgess-roll, that a man who had no land was received into whatever tribe he chose and then according to his means into the corresponding century. But this alteration was too far in advance of the spirit of the age to obtain full acceptance. One of the immediate successors of Appius, Quintus Fabius Rullianus, the famous conqueror of the Samnites, undertook in his censorship of 450 not to set it aside entirely, but to confine it within such limits that the real power in the burgess-assemblies should continue to be vested in the holders of land and of wealth. He assigned those who had no land collectively to the four city tribes, which were now made to rank not as the first but as the last. The rural tribes, on the other hand, the number of which gradually increased between 367 and 513 from seventeen to thirty-one—thus

Page 279

forming a majority, greatly preponderating from the first and ever increasing in preponderance, of the voting-divisions—were reserved by law for the whole of the burgesses who were freeholders. In the centuries the equalization of the freeholders and non-freeholders remained as Appius had introduced it. In this manner provision was made for the preponderance of the freeholders in the comitia of the tribes, while for the centuriate comitia in themselves the wealthy already turned the scale. By this wise and moderate arrangement on the part of a man who for his warlike feats and still more for this peaceful achievement justly received the surname of the Great (-Maximus-), on the one hand the duty of bearing arms was extended, as was fitting, also to the non-freehold burgesses; on the other hand care was taken that their influence, especially that of those who had once been slaves and who were for the most part without property in land, should be subjected to that check which is unfortunately, in a state allowing slavery, an indispensable necessity. A peculiar moral jurisdiction, moreover, which gradually came to be associated with the census and the making up of the burgess-roll, excluded from the burgess-body all individuals notoriously unworthy, and guarded the full moral and political purity of citizenship.

Increasing Powers of the Burgesses

The powers of the comitia exhibited during this period a tendency to enlarge their range, but in a manner very gradual. The increase in the number of magistrates to be elected by the people falls, to some extent, under this head; it is an especially significant fact that from 392 the military tribunes of one legion, and from 443 four tribunes in each of the first four legions respectively, were nominated no longer by the general, but by the burgesses. During this period the burgesses did not on the whole interfere in administration; only their right of declaring war was, as was reasonable, emphatically maintained, and held to extend also to cases in which a prolonged armistice concluded instead of a peace expired and what was not in law but in fact a new war began (327). In other instances a question of administration was hardly submitted to the people except when the governing authorities fell into collision and one of them referred the matter to the people—as when the leaders of the moderate party among the nobility, Lucius Valerius and Marcus Horatius, in 305, and the first plebeian dictator, Gaius Marcius Rutilus, in 398, were not allowed by the senate to receive the triumphs they had earned; when the consuls of 459 could not agree as to their respective provinces of jurisdiction; and when the senate, in 364, resolved to give up to the Gauls an ambassador who had forgotten his duty, and a consular tribune carried the matter to the community. This was the first occasion on which a decree of the senate was annulled by the people; and heavily the community atoned for it. Sometimes in difficult

Page 280

cases the government left the decision to the people, as first, when Caere sued for peace, after the people had declared war against it but before war had actually begun (401); and at a subsequent period, when the senate hesitated to reject unceremoniously the humble entreaty of the Samnites for peace (436). It is not till towards the close of this epoch that we find a considerably extended intervention of the -comitia tributa- in affairs of administration, particularly through the practice of consulting it as to the conclusion of peace and of alliances: this extension probably dates from the Hortensian law of 467.

Decreasing Importance of the Burgess-Body

But notwithstanding these enlargements of the powers of the burgess-assemblies, their practical influence on state affairs began, particularly towards the close of this period, to wane. First of all, the extension of the bounds of Rome deprived her primary assembly of its true basis. As an assembly of the freeholders of the community, it formerly might very well meet in sufficiently full numbers, and might very well know its own wishes, even without discussion; but the Roman burgess-body had now become less a civic community than a state. The fact that those dwelling together voted also with each other, no doubt, introduced into the Roman comitia, at least when the voting was by tribes, a sort of inward connection and into the voting now and then energy and independence; but under ordinary circumstances the composition of the comitia and their decision were left dependent on the person who presided or on accident, or were committed to the hands of the burgesses domiciled in the capital. It is, therefore, quite easy to understand how the assemblies of the burgesses, which had great practical importance during the first two centuries of the republic, gradually became a mere instrument in the hands of the presiding magistrate, and in truth a very dangerous instrument, because the magistrates called to preside were so numerous, and every resolution of the community was regarded as the ultimate legal expression of the will of the people. But the enlargement of the constitutional rights of the burgesses was not of much moment, inasmuch as these were less than formerly capable of a will and action of their own, and there was as yet no demagogism, in the proper sense of that term, in Rome. Had any such demagogic spirit existed, it would have attempted not to extend the powers of the burgesses, but to remove the restrictions on political debate in their presence; whereas throughout this whole period there was undeviating acquiescence in the old maxims, that the magistrate alone could convoke the burgesses, and that he was entitled to exclude all debate and all proposal of amendments. At the time this incipient breaking up of the constitution made itself felt chiefly in the circumstance that the primary assemblies assumed an essentially passive attitude, and did not on the whole interfere in government either to help or to hinder it.

Page 281

The Magistrates. Partition and Weakening of the Consular Powers

As regards the power of the magistrates, its diminution, although not the direct design of the struggles between the old and new burgesses, was doubtless one of their most important results. At the beginning of the struggle between the orders or, in other words, of the strife for the possession of the consular power, the consulate was still the one and indivisible, essentially regal, magistracy; and the consul, like the king in former times, still had the appointment of all subordinate functionaries left to his own free choice. At the termination of that contest its most important functions —jurisdiction, street-police, election of senators and equites, the census and financial administration —were separated from the consulship and transferred to magistrates, who like the consul were nominated by the community and occupied a position far more co-ordinate than subordinate. The consulate, formerly the single ordinary magistracy of the state, was now no longer even absolutely the first. In the new arrangement as to the ranking and usual order of succession of the public offices the consulate stood indeed above the praetorship, aedileship, and quaestorship, but beneath the censorship, which—in addition to the most important financial duties —was charged with the adjustment of the rolls of burgesses, equites, and senators, and thereby wielded a wholly arbitrary moral control over the entire community and every individual burgess, the humblest as well as the most prominent. The conception of limited magisterial power or special function, which seemed to the original Roman state-law irreconcilable with the conception of supreme office, gradually gained a footing and mutilated and destroyed the earlier idea of the one and indivisible -imperium-. A first step was already taken in this direction by the institution of the standing collateral offices, particularly the quaestorship;(14) it was completely carried out by the Licinian laws (387), which prescribed the functions of the three supreme magistrates, and assigned administration and the conduct of war to the two first, and the management of justice to the third. But the change did not stop here. The consuls, although they were in law wholly and everywhere co-ordinate, naturally from the earliest times divided between them in practice the different departments of duty (-provinciae-). Originally this was done simply by mutual concert, or in default of it by casting lots; but by degrees the other constituent authorities in the commonwealth interfered with this practical definition of functions. It became usual for the senate to define annually the spheres of duty; and, while it did not directly distribute them among the co-ordinate magistrates, it exercised decided influence on the personal distribution by advice and request. In an extreme case the senate doubtless obtained a decree of the community, definitively to

Page 282

settle the question of distribution;(15) the government, however, very seldom employed this dangerous expedient. Further, the most important affairs, such as the concluding of peace, were withdrawn from the consuls, and they were in such matters obliged to have recourse to the senate and to act according to its instructions. Lastly, in cases of extremity the senate could at any time suspend the consuls from office; for, according to an usage never established by law but never violated in practice, the creation of a dictatorship depended simply upon the resolution of the senate, and the fixing of the person to be nominated, although constitutionally vested in the nominating consul, really under ordinary circumstances lay with the senate.

Limitation of the Dictatorship

The old unity and plenary legal power of the -imperium- were retained longer in the case of the dictatorship than in that of the consulship. Although of course as an extraordinary magistracy it had in reality from the first its special functions, it had in law far less of a special character than the consulate. But it also was gradually affected by the new idea of definite powers and functions introduced into the legal life of Rome. In 391 we first meet with a dictator expressly nominated from theological scruples for the mere accomplishment of a religious ceremony; and though that dictator himself, doubtless in formal accordance with the constitution, treated the restriction of his powers as null and took the command of the army in spite of it, such an opposition on the part of the magistrate was not repeated on occasion of the subsequent similarly restricted nominations, which occurred in 403 and thenceforward very frequently. On the contrary, the dictators thenceforth accounted themselves bound by their powers as specially defined.

Restriction as to the Accumulation and the Reoccupation of Offices

Lastly, further seriously felt restrictions of the magistracy were involved in the prohibition issued in 412 against the accumulation of the ordinary curule offices, and in the enactment of the same date, that the same person should not again administer the same office under ordinary circumstances before an interval of ten years had elapsed, as well as in the subsequent regulation that the office which practically was the highest, the censorship, should not be held a second time at all (489). But the government was still strong enough not to be afraid of its instruments or to desist purposely on that account from employing those who were the most serviceable. Brave officers were very frequently released from these rules,(16) and cases still occurred like those of Quintus Fabius Rullianus, who was five times consul in twenty-eight years, and of Marcus Valerius Corvus (384-483) who, after he had filled six consulships, the first in his twenty-third, the last in his seventy-second year, and had been throughout three generations the protector of his countrymen and the terror of the foe, descended to the grave at the age of a hundred.

Page 283

The Tribune of the People as an Instrument of Government

While the Roman magistrate was thus more and more completely and definitely transformed from the absolute lord into the limited commissioner and administrator of the community, the old counter-magistracy, the tribunate of the people, was undergoing at the same time a similar transformation internal rather than external. It served a double purpose in the commonwealth. It had been from the beginning intended to protect the humble and the weak by a somewhat revolutionary assistance (-auxilium-) against the overbearing violence of the magistrates; it had subsequently been employed to get rid of the legal disabilities of the commons and the privileges of the gentile nobility. The latter end was attained. The original object was not only in itself a democratic ideal rather than a political possibility, but it was also quite as obnoxious to the plebeian aristocracy into whose hands the tribunate necessarily fell, and quite as incompatible with the new organization which originated in the equalization of the orders and had if possible a still more decided aristocratic hue than that which preceded it, as it was obnoxious to the gentile nobility and incompatible with the patrician consular constitution. But instead of abolishing the tribunate, they preferred to convert it from a weapon of opposition into an instrument of government, and now introduced the tribunes of the people, who were originally excluded from all share in administration and were neither magistrates nor members of the senate, into the class of governing authorities.

While in jurisdiction they stood from the beginning on an equality with the consuls and in the early stages of the conflicts between the orders acquired like the consuls the right of initiating legislation, they now received—we know not exactly when, but presumably at or soon after the final equalization of the orders—a position of equality with the consuls as confronting the practically governing authority, the senate. Hitherto they had been present at the proceedings of the senate, sitting on a bench at the door; now they obtained, like the other magistrates and by their side, a place in the senate itself and the right to interpose their word in its discussions. If they were precluded from the right of voting, this was simply an application of the general principle of Roman state-law, that those only should give counsel who were not called to act; in accordance with which the whole of the acting magistrates possessed during their year of office only a seat, not a vote, in the council of the state.⁽¹⁷⁾ But concession did not rest here. The tribunes received the distinctive prerogative of supreme magistracy, which among the ordinary magistrates belonged only to the consuls and praetors besides—the right of convoking the senate, of consulting it, and of procuring decrees from it.⁽¹⁸⁾ This was only as it should be; the heads of the plebeian aristocracy

Page 284

could not but be placed on an equality with those of the patrician aristocracy in the senate, when once the government had passed from the clan-nobility to the united aristocracy. Now that this opposition-college, originally excluded from all share in the public administration, became—particularly with reference to strictly urban affairs—a second supreme executive and one of the most usual and most serviceable instruments of the government, or in other words of the senate, for managing the burgesses and especially for checking the excesses of the magistrates, it was certainly, as respected its original character, absorbed and politically annihilated; but this course was really enjoined by necessity. Clearly as the defects of the Roman aristocracy were apparent, and decidedly as the steady growth of aristocratic ascendancy was connected with the practical setting aside of the tribunate, none can fail to see that government could not be long carried on with an authority which was not only aimless and virtually calculated to put off the suffering proletariat with a deceitful prospect of relief, but was at the same time decidedly revolutionary and possessed of a—strictly speaking—anarchical prerogative of obstruction to the authority of the magistrates and even of the state itself. But that faith in an ideal, which is the foundation of all the power and of all the impotence of democracy, had come to be closely associated in the minds of the Romans with the tribunate of the plebs; and we do not need to recall the case of Cola Rienzi in order to perceive that, however unsubstantial might be the advantage thence arising to the multitude, it could not be abolished without a formidable convulsion of the state. Accordingly with genuine political prudence they contented themselves with reducing it to a nullity under forms that should attract as little attention as possible. The mere name of this essentially revolutionary magistracy was still retained within the aristocratically governed commonwealth—an incongruity for the present, and for the future, in the hands of a coming revolutionary party, a sharp and dangerous weapon. For the moment, however, and for a long time to come the aristocracy was so absolutely powerful and so completely possessed control over the tribunate, that no trace at all is to be met with of a collegiate opposition on the part of the tribunes to the senate; and the government overcame the forlorn movements of opposition that now and then proceeded from individual tribunes, always without difficulty, and ordinarily by means of the tribunate itself.

The Senate. Its Composition

In reality it was the senate that governed the commonwealth, and did so almost without opposition after the equalization of the orders. Its very composition had undergone a change. The free prerogative of the chief magistrates in this matter, as it had been exercised after the setting aside of the old clan-representation,(19) had been already subjected to very material restrictions on the abolition of the presidency for life.(20)

Page 285

A further step towards the emancipation of the senate from the power of the magistrates took place, when the adjustment of the senatorial lists was transferred from the supreme magistrates to subordinate functionaries—from the consuls to the censors.(21) Certainly, whether immediately at that time or soon afterwards, the right of the magistrate entrusted with the preparation of the list to omit from it individual senators on account of a stain attaching to them and thereby to exclude them from the senate was, if not introduced, at least more precisely defined,(22) and in this way the foundations were laid of that peculiar jurisdiction over morals on which the high repute of the censors was chiefly based.(23) But censures of that sort—especially since the two censors had to be at one on the matter —might doubtless serve to remove particular persons who did not contribute to the credit of the assembly or were hostile to the spirit prevailing there, but could not bring the body itself into dependence on the magistracy.

But the right of the magistrates to constitute the senate according to their judgment was decidedly restricted by the Ovinian law, which was passed about the middle of this period, probably soon after the Licinian laws. That law at once conferred a seat and vote in the senate provisionally on every one who had been curule aedile, praetor, or consul, and bound the next censors either formally to inscribe these expectants in the senatorial roll, or at any rate to exclude them from the roll only for such reasons as sufficed for the rejection of an actual senator. The number of those, however, who had been magistrates was far from sufficing to keep the senate up to the normal number of three hundred; and below that point it could not be allowed to fall, especially as the list of senators was at the same time that of jurymen. Considerable room was thus always left for the exercise of the censorial right of election; but those senators who were chosen not in consequence of having held office, but by selection on the part of the censor—frequently burgesses who had filled a non-curule public office, or distinguished themselves by personal valour, who had killed an enemy in battle or saved the life of a burgess—took part in voting, but not in debate.(24) The main body of the senate, and that portion of it into whose hands government and administration were concentrated, was thus according to the Ovinian law substantially based no longer on the arbitrary will of a magistrate, but indirectly on election by the people. The Roman state in this way made some approach to, although it did not reach, the great institution of modern times, representative popular government, while the aggregate of the non-debating senators furnished—what it is so necessary and yet so difficult to get in governing corporations—a compact mass of members capable of forming and entitled to pronounce an opinion, but voting in silence.

Page 286

Powers of the Senate

The powers of the senate underwent scarcely any change in form. The senate carefully avoided giving a handle to opposition or to ambition by unpopular changes, or manifest violations, of the constitution; it permitted, though it did not promote, the enlargement in a democratic direction of the power of the burgesses. But while the burgesses acquired the semblance, the senate acquired the substance of power—a decisive influence over legislation and the official elections, and the whole control of the state.

Its Influence in Legislation

Every new project of law was subjected to a preliminary deliberation in the senate, and scarcely ever did a magistrate venture to lay a proposal before the community without or in opposition to the senate's opinion. If he did so, the senate had—in the intercessory powers of the magistrates and the annulling powers of the priests—an ample set of means at hand to nip in the bud, or subsequently to get rid of, obnoxious proposals; and in case of extremity it had in its hands as the supreme administrative authority not only the executing, but the power of refusing to execute, the decrees of the community. The senate further with tacit consent of the community claimed the right in urgent cases of absolving from the laws, under the reservation that the community should ratify the proceeding—a reservation which from the first was of little moment, and became by degrees so entirely a form that in later times they did not even take the trouble to propose the ratifying decree.

Influence on the Elections

As to the elections, they passed, so far as they depended on the magistrates and were of political importance, practically into the hands of the senate. In this way it acquired, as has been mentioned already,(25) the right to appoint the dictator. Great regard had certainly to be shown to the community; the right of bestowing the public magistracies could not be withdrawn from it; but, as has likewise been already observed, care was taken that this election of magistrates should not be constructed into the conferring of definite functions, especially of the posts of supreme command when war was imminent. Moreover the newly introduced idea of special functions on the one hand, and on the other the right practically conceded to the senate of dispensation from the laws, gave to it an important share in official appointments. Of the influence which the senate exercised in settling the official spheres of the consuls in particular, we have already spoken.(26) One of the most important applications of the dispensing right was the dispensation of the magistrate from the legal term of his tenure of office—a dispensation which, as contrary to the fundamental laws of the community, might not according to Roman state-law be granted in the precincts of the city proper, but beyond these was at least so far valid that the consul or praetor, whose term was prolonged,

Page 287

continued after its expiry to discharge his functions “in a consul’s or praetor’s stead” (-pro consule- -pro praetore-). Of course this important right of extending the term of office—essentially on a par with the right of nomination—belonged by law to the community alone, and at the beginning was in fact exercised by it; but in 447, and regularly thenceforward, the command of the commander-in-chief was prolonged by mere decree of the senate. To this was added, in fine, the preponderating and skilfully concerted influence of the aristocracy over the elections, which guided them ordinarily, although not always, to the choice of candidates agreeable to the government.

Senatorial Government

Finally as regards administration, war, peace and alliances, the founding of colonies, the assignation of lands, building, in fact every matter of permanent and general importance, and in particular the whole system of finance, depended absolutely on the senate. It was the senate which annually issued general instructions to the magistrates, settling their spheres of duty and limiting the troops and moneys to be placed at the disposal of each; and recourse was had to its counsel in every case of importance. The keepers of the state-chest could make no payment to any magistrate with the exception of the consul, or to any private person, unless authorized by a previous decree of the senate. In the management, however, of current affairs and in the details of judicial and military administration the supreme governing corporation did not interfere; the Roman aristocracy had too much political judgment and tact to desire to convert the control of the commonwealth into a guardianship over the individual official, or to turn the instrument into a machine.

That this new government of the senate amidst all its retention of existing forms involved a complete revolutionizing of the old commonwealth, is clear. That the free action of the burgesses should be arrested and benumbed; that the magistrates should be reduced to be the presidents of its sittings and its executive commissioners; that a corporation for the mere tendering of advice should seize the inheritance of both the authorities sanctioned by the constitution and should become, although under very modest forms, the central government of the state—these were steps of revolution and usurpation. Nevertheless, if any revolution or any usurpation appears justified before the bar of history by exclusive ability to govern, even its rigorous judgment must acknowledge that this corporation timeously comprehended and worthily fulfilled its great task. Called to power not by the empty accident of birth, but substantially by the free choice of the nation; confirmed every fifth year by the stern moral judgment of the worthiest men; holding office for life, and so not dependent on the expiration of its commission or on the varying opinion of the people; having its ranks close and united ever after the equalization

Page 288

of the orders; embracing in it all the political intelligence and practical statesmanship that the people possessed; absolute in dealing with all financial questions and in the guidance of foreign policy; having complete power over the executive by virtue of its brief duration and of the tribunician intercession which was at the service of the senate after the termination of the quarrels between the orders—the Roman senate was the noblest organ of the nation, and in consistency and political sagacity, in unanimity and patriotism, in grasp of power and unwavering courage, the foremost political corporation of all times—still even now an “assembly of kings,” which knew well how to combine despotic energy with republican self-devotion. Never was a state represented in its external relations more firmly and worthily than Rome in its best times by its senate. In matters of internal administration it certainly cannot be concealed that the moneyed and landed aristocracy, which was especially represented in the senate, acted with partiality in affairs that bore upon its peculiar interests, and that the sagacity and energy of the body were often in such cases employed far from beneficially to the state. Nevertheless the great principle established amidst severe conflicts, that all Roman burgesses were equal in the eye of the law as respected rights and duties, and the opening up of a political career (or in other words, of admission to the senate) to every one, which was the result of that principle, concurred with the brilliance of military and political successes in preserving the harmony of the state and of the nation, and relieved the distinction of classes from that bitterness and malignity which marked the struggle of the patricians and plebeians. And, as the fortunate turn taken by external politics had the effect of giving the rich for more than a century ample space for themselves and rendered it unnecessary that they should oppress the middle class, the Roman people was enabled by means of its senate to carry out for a longer term than is usually granted to a people the grandest of all human undertakings—a wise and happy self-government.

Notes for Book II Chapter III

1. The hypothesis that legally the full -imperium- belonged to the patrician, and only the military -imperium- to the plebeian, consular tribunes, not only provokes various questions to which there is no answer—as to the course followed, for example, in the event of the election falling, as was by law quite possible, wholly on plebeians—but specially conflicts with the fundamental principle of Roman constitutional law, that the -imperium-, that is to say, the right of commanding the burgess in name of the community, was functionally indivisible and capable of no other limitation at all than a territorial one. There was a province of urban law and a province of military law, in the latter of which the -provocatio- and other

Page 289

regulations of urban law were not applicable; there were magistrates, such as the proconsuls, who were empowered to discharge functions simply in the latter; but there were, in the strict sense of law, no magistrates with merely jurisdictional, as there were none with merely military, -imperium-. The proconsul was in his province, just like the consul, at once commander-in-chief and supreme judge, and was entitled to send to trial actions not only between non-burgesses and soldiers, but also between one burgess and another. Even when, on the institution of the praetorship, the idea rose of apportioning special functions to the -magistratus maiores-, this division of powers had more of a practical than of a strictly legal force; the -praetor urbanus- was primarily indeed the supreme judge, but he could also convoke the centuries, at least for certain cases, and could command an army; the consul in the city held primarily the supreme administration and the supreme command, but he too acted as a judge in cases of emancipation and adoption—the functional indivisibility of the supreme magistracy was therefore, even in these instances, very strictly adhered to on both sides. Thus the military as well as jurisdictional authority, or, laying aside these abstractions foreign to the Roman law of this period, the absolute magisterial power, must have virtually pertained to the plebeian consular tribunes as well as to the patrician. But it may well be, as Becker supposes (Handb. ii. 2, 137), that, for the same reasons, for which at a subsequent period there was placed alongside of the consulship common to both orders the praetorship actually reserved for a considerable time for the patricians, even during the consular tribunate the plebeian members of the college were -de facto- kept aloof from jurisdiction, and so far the consular tribunate prepared the way for the subsequent actual division of jurisdiction between consuls and praetors.

2. I. Vi. Political Effects of the Servian Military Organization

3. The defence, that the aristocracy clung to the exclusion of the plebeians from religious prejudice, mistakes the fundamental character of the Roman religion, and imports into antiquity the modern distinction between church and state. The admittance of a non-burgess to a religious ceremony of the citizens could not indeed but appear sinful to the orthodox Roman; but even the most rigid orthodoxy never doubted that admittance to civic communion, which absolutely and solely depended on the state, involved also full religious equality. All such scruples of conscience, the honesty of which in themselves we do not mean to doubt, were precluded, when once they granted to the plebeians -en masse- at the right time the patriciate. This only may perhaps be alleged by way of excuse for the nobility, that after it had neglected the right moment for this purpose at the abolition of the monarchy, it was no longer in a position subsequently of itself to retrieve the neglect (*ii. I. The New Community*).

Page 290

4. Whether this distinction between these “curule houses” and the other families embraced within the patriciate was ever of serious political importance, cannot with certainty be either affirmed or denied; and as little do we know whether at this epoch there really was any considerable number of patrician families that were not yet curule.

10. II. III. Equivalence Law and Plebiscitum

11. The statements as to the poverty of the consulars of this period, which play so great a part in the moral anecdote-books of a later age, mainly rest on a misunderstanding on the one hand of the old frugal economy—which might very well consist with considerable prosperity—and on the other hand of the beautiful old custom of burying men who had deserved well of the state from the proceeds of penny collections—which was far from being a pauper burial. The method also of explaining surnames by etymological guess-work, which has imported so many absurdities into Roman history, has furnished its quota to this belief (-Serranus-).

15. II. III. Increasing Powers of the Burgesses

16. Any one who compares the consular Fasti before and after 412 will have no doubt as to the existence of the above-mentioned law respecting re-election to the consulate; for, while before that year a return to office, especially after three or four years, was a common occurrence, afterwards intervals of ten years and more were as frequent. Exceptions, however, occur in very great numbers, particularly during the severe years of war 434-443. On the other hand, the principle of not allowing a plurality of offices was strictly adhered to. There is no certain instance of the combination of two of the three ordinary curule (Liv. xxxix. 39, 4) offices (the consulate, praetorship, and curule aedileship), but instances occur of other combinations, such as of the curule aedileship and the office of master of the horse (Liv. xxiii. 24, 30); of the praetorship and

censorship (Fast. Cap. a. 501); of the praetorship and the dictatorship (Liv. viii. 12); of the consulate and the dictatorship (Liv. viii. 12).

17. II. I. Senate

18. Hence despatches intended for the senate were addressed to Consuls, Praetors, Tribunes of the Plebs, and Senate (Cicero, ad Fam. xv. 2, *et al.*)

20. II. I. Senate

21. II. III. Censorship

Page 291

22. This prerogative and the similar ones with reference to the equestrian and burgess-lists were perhaps not formally and legally assigned to the censors, but were always practically implied in their powers. It was the community, not the censor, that conferred burgess-rights; but the person, to whom the latter in making up the list of persons entitled to vote did not assign a place or assigned an inferior one, did not lose his burgess-right, but could not exercise the privileges of a burgess, or could only exercise them in the inferior place, till the preparation of a new list. The same was the case with the senate; the person omitted by the censor from his list ceased to attend the senate, as long as the list in question remained valid—unless the presiding magistrate should reject it and reinstate the earlier list. Evidently therefore the important question in this respect was not so much what was the legal liberty of the censors, as how far their authority availed with those magistrates who had to summon according to their lists. Hence it is easy to understand how this prerogative gradually rose in importance, and how with the increasing consolidation of the nobility such erasures assumed virtually the form of judicial decisions and were virtually respected as such. As to the adjustment of the senatorial list undoubtedly the enactment of the Ovinian -plebiscitum- exercised a material share of influence—that the censors should admit to the senate “the best men out of all classes.”

CHAPTER IV

Fall of the Etruscan Power-the Celts

Etrusco-Carthaginian Maritime Supremacy

In the previous chapters we have presented an outline of the development of the Roman constitution during the first two centuries of the republic; we now recur to the commencement of that epoch for the purpose of tracing the external history of Rome and of Italy. About the time of the expulsion of the Tarquins from Rome the Etruscan power had reached its height. The Tuscans, and the Carthaginians who were in close alliance with them, possessed undisputed supremacy on the Tyrrhene Sea. Although Massilia amidst continual and severe struggles maintained her independence, the seaports of Campania and of the Volscian land, and after the battle of Alalia Corsica also,(1) were in the possession of the Etruscans. In Sardinia the sons of the

Carthaginian general Mago laid the foundation of the greatness both of their house and of their city by the complete conquest of the island (about 260); and in Sicily, while the Hellenic colonies were occupied with their internal feuds, the Phoenicians retained possession of the western half without material opposition. The vessels of the Etruscans were no less dominant in the Adriatic; and their pirates were dreaded even in the more eastern waters.

Page 292

Subjugation of Latium by Etruria

By land also their power seemed to be on the increase. To acquire possession of Latium was of the most decisive importance to Etruria, which was separated by the Latins alone from the Volscian towns that were dependent on it and from its possessions in Campania. Hitherto the firm bulwark of the Roman power had sufficiently protected Latium, and had successfully maintained against Etruria the frontier line of the Tiber. But now, when the whole Tuscan league, taking advantage of the confusion and the weakness of the Roman state after the expulsion of the Tarquins, renewed its attack more energetically than before under the king Lars Porsena of Clusium, it no longer encountered the wonted resistance. Rome surrendered, and in the peace (assigned to 247) not only ceded all her possessions on the right bank of the Tiber to the adjacent Tuscan communities and thus abandoned her exclusive command of the river, but also delivered to the conqueror all her weapons of war and promised to make use of iron thenceforth only for the ploughshare. It seemed as if the union of Italy under Tuscan supremacy was not far distant.

Etruscans Driven Back from Latium—

Fall of the Etrusco-Carthaginian Maritime Supremacy—

Victories of Salamis and Himera, and Their Effects

But the subjugation, with which the coalition of the Etruscan and Carthaginian nations had threatened both Greeks and Italians, was fortunately averted by the combination of peoples drawn towards each other by family affinity as well as by common peril. The Etruscan army, which after the fall of Rome had penetrated into Latium, had its victorious career checked in the first instance before the walls of Aricia by the well-timed intervention of the Cumaeans who had hastened to the succour of the Aricines (248). We know not how the war ended, nor, in particular, whether Rome even at that time tore up the ruinous and disgraceful peace. This much only is certain, that on this occasion also the Tuscans were unable to maintain their ground permanently on the left bank of the Tiber.

Soon the Hellenic nation was forced to engage in a still more comprehensive and still more decisive conflict with the barbarians both of the west and of the east. It was about the time of the Persian wars. The relation in which the Tyrians stood to the great king led Carthage also to follow in the wake of Persian policy —there exists a credible tradition even as to an alliance between the Carthaginians and Xerxes—and, along with the Carthaginians, the Etruscans. It was one of the grandest of political combinations which simultaneously directed the Asiatic hosts against Greece, and the Phoenician hosts against Sicily, to extirpate at a blow liberty and civilization from the face of the earth. The victory remained with the Hellenes. The battle of Salamis (274) saved and avenged Hellas proper; and on the same day—so runs the story—the

Page 293

rulers of Syracuse and Agrigentum, Gelon and Theron, vanquished the immense army of the Carthaginian general Hamilcar, son of Mago, at Himera so completely, that the war was thereby terminated, and the Phoenicians, who by no means cherished at that time the project of subduing the whole of Sicily on their own account, returned to their previous defensive policy. Some of the large silver pieces are still preserved which were coined for this campaign from the ornaments of Damareta, the wife of Gelon, and other noble Syracusan dames: and the latest times gratefully remembered the gentle and brave king of Syracuse and the glorious victory whose praises Simonides sang.

The immediate effect of the humiliation of Carthage was the fall of the maritime supremacy of her Etruscan allies. Anaxilas, ruler of Rhegium and Zancle, had already closed the Sicilian straits against their privateers by means of a standing fleet (about 272); soon afterwards (280) the Cumaeans and Hiero of Syracuse achieved a decisive victory near Cumae over the Tyrrhene fleet, to which the Carthaginians vainly attempted to render aid. This is the victory which Pindar celebrates in his first Pythian ode; and there is still extant an Etruscan helmet, which Hiero sent to Olympia, with the inscription: "Hieron son of Deinomenes and the Syrakosians to Zeus, Tyrrhane spoil from Kyma."(2)

Maritime Supremacy of the Tarentines and Syracusans—
Dionysius of Syracuse

While these extraordinary successes against the Carthaginians and Etruscans placed Syracuse at the head of the Greek cities in Sicily, the Doric Tarentum rose to undisputed pre-eminence among the Italian Hellenes, after the Achaean Sybaris had fallen about the time of the expulsion of the kings from Rome (243). The terrible defeat of the Tarentines by the Iapygians (280), the most severe disaster which a Greek army had hitherto sustained, served only, like the Persian invasion of Hellas, to unshackle the whole might of the national spirit in the development of an energetic democracy. Thenceforth the Carthaginians and the Etruscans were no longer paramount in the Italian waters; the Tarentines predominated in the Adriatic and Ionic, the Massiliots and Syracusans in the Tyrrhene, seas. The latter in particular restricted more and more the range of Etruscan piracy. After the victory at Cumae, Hiero had occupied the island of Aenaria (Ischia), and by that means interrupted the communication between the Campanian and the northern Etruscans. About the year 302, with a view thoroughly to check Tuscan piracy, Syracuse sent forth a special expedition, which ravaged the island of Corsica and the Etruscan coast and occupied the island of Aethalia (Elba). Although Etrusco-Carthaginian piracy was not wholly repressed—Antium, for example, having apparently continued a haunt of privateering down to the beginning of the fifth century of Rome—the powerful Syracuse formed a strong bulwark against the allied

Page 294

Tuscans and Phoenicians. For a moment, indeed, it seemed as if the Syracusan power must be broken by the attack of the Athenians, whose naval expedition against Syracuse in the course of the Peloponnesian war (339-341) was supported by the Etruscans, old commercial friends of Athens, with three fifty-oared galleys. But the victory remained, as is well known, both in the west and in the east with the Dorians. After the ignominious failure of the Attic expedition, Syracuse became so indisputably the first Greek maritime power that the men, who were there at the head of the state, aspired to the sovereignty of Sicily and Lower Italy, and of both the Italian seas; while on the other hand the Carthaginians, who saw their dominion in Sicily now seriously in danger, were on their part also obliged to make, and made, the subjugation of the Syracusans and the reduction of the whole island the aim of their policy. We cannot here narrate the decline of the intermediate Sicilian states, and the increase of the Carthaginian power in the island, which were the immediate results of these struggles; we notice their effect only so far as Etruria is concerned. The new ruler of Syracuse, Dionysius (who reigned 348-337), inflicted on Etruria blows which were severely felt. The far-scheming king laid the foundation of his new colonial power especially in the sea to the east of Italy, the more northern waters of which now became, for the first time, subject to a Greek maritime power. About the year 367, Dionysius occupied and colonized the port of Lissus and island of Issa on the Illyrian coast, and the ports of Ancona, Numana, and Atria, on the coast of Italy. The memory of the Syracusan dominion in this remote region is preserved not only by the "trenches of Philistus," a canal constructed at the mouth of the Po beyond doubt by the well-known historian and friend of Dionysius who spent the years of his exile (368 et seq.) at Atria, but also by the alteration in the name of the Italian eastern sea itself, which from this time forth, instead of its earlier designation of the "Ionic Gulf",⁽³⁾ received the appellation still current at the present day, and probably referable to these events, of the sea "of Hadria."⁽⁴⁾ But not content with these attacks on the possessions and commercial communications of the Etruscans in the eastern sea, Dionysius assailed the very heart of the Etruscan power by storming and plundering Pyrgi, the rich seaport of Caere (369). From this blow it never recovered. When the internal disturbances that followed the death of Dionysius in Syracuse gave the Carthaginians freer scope, and their fleet resumed in the Tyrrhene sea that ascendancy which with but slight interruptions they thenceforth maintained, it proved a burden no less grievous to Etruscans than to Greeks; so that, when Agathocles of Syracuse in 444 was making preparations for war with Carthage, he was even joined by eighteen Tuscan vessels of war. The Etruscans perhaps had their fears in regard to Corsica, which they probably still at that time retained. The old Etrusco-Phoenician symmachy, which still existed in the time of Aristotle (370-432), was thus broken up; but the Etruscans never recovered their maritime strength.

Page 295

The Romans Opposed to the Etruscans in Veii

This rapid collapse of the Etruscan maritime power would be inexplicable but for the circumstance that, at the very time when the Sicilian Greeks were attacking them by sea, the Etruscans found themselves assailed with the severest blows on every side by land. About the time of the battles of Salamis, Himera, and Cumae a furious war raged for many years, according to the accounts of the Roman annals, between Rome and Veii (271-280). The Romans suffered in its course severe defeats. Tradition especially preserved the memory of the catastrophe of the Fabii (277), who had in consequence of internal commotions voluntarily banished themselves from the capital⁽⁴⁾ and had undertaken the defence of the frontier against Etruria, and who were slain to the last man capable of bearing arms at the brook Cremera. But the armistice for 400 months, which in room of a peace terminated the war, was so far favourable to the Romans that it at least restored the -status quo- of the regal period; the Etruscans gave up Fidenae and the district won by them on the right bank of the Tiber. We cannot ascertain how far this Romano-Etruscan war was connected directly with the war between the Hellenes and the Persians, and with that between the Sicilians and Carthaginians; but whether the Romans were or were not allies of the victors of Salamis and of Himera, there was at any rate a coincidence of interests as well as of results.

The Samnites Opposed to the Etruscans in Campania

The Samnites as well as the Latins threw themselves upon the Etruscans; and hardly had their Campanian settlement been cut off from the motherland in consequence of the battle of Cumae, when it found itself no longer able to resist the assaults of the Sabellian mountain tribes. Capua, the capital, fell in 330; and the Tuscan population there was soon after the conquest extirpated or expelled by the Samnites. It is true that the Campanian Greeks also, isolated and weakened, suffered severely from the same invasion: Cumae itself was conquered by the Sabellians in 334. But the Hellenes maintained their ground at Neapolis especially, perhaps with the aid of the Syracusans, while the Etruscan name in Campania disappeared from history—excepting some detached Etruscan communities, which prolonged a pitiful and forlorn existence there.

Events still more momentous, however, occurred about the same time in Northern Italy. A new nation was knocking at the gates of the Alps: it was the Celts; and their first pressure fell on the Etruscans.

Page 296

The Celtic, Galatian, or Gallic nation received from the common mother endowments different from those of its Italian, Germanic, and Hellenic sisters. With various solid qualities and still more that were brilliant, it was deficient in those deeper moral and political qualifications which lie at the root of all that is good and great in human development. It was reckoned disgraceful, Cicero tells us, for the free Celts to till their fields with their own hands. They preferred a pastoral life to agriculture; and even in the fertile plains of the Po they chiefly practised the rearing of swine, feeding on the flesh of their herds, and staying with them in the oak forests day and night. Attachment to their native soil, such as characterized the Italians and the Germans, was wanting in the Celts; while on the other hand they delighted to congregate in towns and villages, which accordingly acquired magnitude and importance among the Celts earlier apparently than in Italy. Their political constitution was imperfect. Not only was the national unity recognized but feebly as a bond of connection—as is, in fact, the case with all nations at first—but the individual communities were deficient in concord and firm control, in earnest public spirit and consistency of aim. The only organization for which they were fitted was a military one, where the bonds of discipline relieved the individual from the troublesome task of self-control. “The prominent qualities of the Celtic race,” says their historian Thierry, “were personal bravery, in which they excelled all nations; an open impetuous temperament, accessible to every impression; much intelligence, but at the same time extreme mobility, want of perseverance, aversion to discipline and order, ostentation and perpetual discord—the result of boundless vanity.” Cato the Elder more briefly describes them, nearly to the same effect; “the Celts devote themselves mainly to two things—fighting and -esprit-.”(6) Such qualities—those of good soldiers but of bad citizens—explain the historical fact, that the Celts have shaken all states and have founded none. Everywhere we find them ready to rove or, in other words, to march; preferring moveable property to landed estate, and gold to everything else; following the profession of arms as a system of organized pillage or even as a trade for hire, and with such success at all events that even the Roman historian Sallust acknowledges that the Celts bore off the prize from the Romans in feats of arms. They were the true soldiers-of-fortune of antiquity, as figures and descriptions represent them: with big but not sinewy bodies, with shaggy hair and long mustaches—quite a contrast to the Greeks and Romans, who shaved the head and upper lip; in variegated embroidered dresses, which in combat were not unfrequently thrown off; with a broad gold ring round the neck; wearing no helmets and without missile weapons of any sort, but furnished instead with an immense shield,

Page 297

a long ill-tempered sword, a dagger and a lance—all ornamented with gold, for they were not unskilful at working in metals. Everything was made subservient to ostentation, even wounds, which were often subsequently enlarged for the purpose of boasting a broader scar. Usually they fought on foot, but certain tribes on horseback, in which case every freeman was followed by two attendants likewise mounted; war-chariots were early in use, as they were among the Libyans and the Hellenes in the earliest times. Various traits remind us of the chivalry of the Middle Ages; particularly the custom of single combat, which was foreign to the Greeks and Romans. Not only were they accustomed during war to challenge a single enemy to fight, after having previously insulted him by words and gestures; during peace also they fought with each other in splendid suits of armour, as for life or death. After such feats carousals followed as a matter of course. In this way they led, whether under their own or a foreign banner, a restless soldier-life; they were dispersed from Ireland and Spain to Asia Minor, constantly occupied in fighting and so-called feats of heroism. But all their enterprises melted away like snow in spring; and nowhere did they create a great state or develop a distinctive culture of their own.

Celtic Migrations—

The Celts Assail the Etruscans in Northern Italy

Such is the description which the ancients give us of this nation. Its origin can only be conjectured. Sprung from the same cradle from which the Hellenic, Italian, and Germanic peoples issued,(7) the Celts doubtless like these migrated from their eastern motherland into Europe, where at a very early period they reached the western ocean and established their headquarters in what is now France, crossing to settle in the British isles on the north, and on the south passing the Pyrenees and contending with the Iberian tribes for the possession of the peninsula. This, their first great migration, flowed past the Alps, and it was from the lands to the westward that they first began those movements of smaller masses in the opposite direction—movements which carried them over the Alps and the Haemus and even over the Bosphorus, and by means of which they became and for many centuries continued to be the terror of the whole civilized nations of antiquity, till the victories of Caesar and the frontier defence organized by Augustus for ever broke their power.

The native legend of their migrations, which has been preserved to us mainly by Livy, relates the story of these later retrograde movements as follows.(8) The Gallic confederacy, which was headed then as in the time of Caesar by the canton of the Bituriges (around Bourges), sent forth in the days of king Ambiatius two great hosts led by the two nephews of the king. One of these nephews, Sigovesus, crossed the Rhine and advanced in the direction of the Black Forest, while the second, Bellovesus, crossed the Graian Alps

Page 298

(the Little St. Bernard) and descended into the valley of the Po. From the former proceeded the Gallic settlement on the middle Danube; from the latter the oldest Celtic settlement in the modern Lombardy, the canton of the Insubres with Mediolanum (Milan) as its capital. Another host soon followed, which founded the canton of the Cenomani with the towns of Brixia (Brescia) and Verona. Ceaseless streams thenceforth poured over the Alps into the beautiful plain; the Celtic tribes with the Ligurians whom they dislodged and swept along with them wrested place after place from the Etruscans, till the whole left bank of the Po was in their hands. After the fall of the rich Etruscan town Melpum (presumably in the district of Milan), for the subjugation of which the Celts already settled in the basin of the Po had united with newly arrived tribes (358?), these latter crossed to the right bank of the river and began to press upon the Umbrians and Etruscans in their original abodes. Those who did so were chiefly the Boii, who are alleged to have penetrated into Italy by another route, over the Poenine Alps (the Great St. Bernard): they settled in the modern Romagna, where the old Etruscan town Felsina, with its name changed by its new masters to Bononia, became their capital. Finally came the Senones, the last of the larger Celtic tribes which made their way over the Alps; they took up their abode along the coast of the Adriatic from Rimini to Ancona. But isolated bands of Celtic settlers must have advanced even far in the direction of Umbria, and up to the border of Etruria proper; for stone-inscriptions in the Celtic language have been found even at Todi on the upper Tiber. The limits of Etruria on the north and east became more and more contracted, and about the middle of the fourth century the Tuscan nation found themselves substantially restricted to the territory which thenceforth bore and still bears their name.

Attack on Etruria by the Romans

Subjected to these simultaneous and, as it were, concerted assaults on the part of very different peoples—the Syracusans, Latins, Samnites, and above all the Celts—the Etruscan nation, that had just acquired so vast and sudden an ascendancy in Latium and Campania and on both the Italian seas, underwent a still more rapid and violent collapse. The loss of their maritime supremacy and the subjugation of the Campanian Etruscans belong to the same epoch as the settlement of the Insubres and Cenomani on the Po; and about this same period the Roman burgesses, who had not very many years before been humbled to the utmost and almost reduced to bondage by Porsena, first assumed an attitude of aggression towards Etruria. By the armistice with Veii in 280 Rome had recovered its ground, and the two nations were restored in the main to the state in which they had stood in the time of the kings. When it expired in the year 309, the warfare began afresh; but it took the form of border frays and pillaging

Page 299

excursions which led to no material result on either side. Etruria was still too powerful for Rome to be able seriously to attack it. At length the revolt of the Fidenates, who expelled the Roman garrison, murdered the Roman envoys, and submitted to Lars Tolumnius, king of the Veientes, gave rise to a more considerable war, which ended favourably for the Romans; the king Tolumnius fell in combat by the hand of the Roman consul Aulus Cornelius Cossus (326?), Fidenae was taken, and a new armistice for 200 months was concluded in 329. During this truce the troubles of Etruria became more and more aggravated, and the Celtic arms were already approaching the settlements that hitherto had been spared on the right bank of the Po. When the armistice expired in the end of 346, the Romans on their part resolved to undertake a war of conquest against Etruria; and on this occasion the war was carried on not merely to vanquish Veii, but to crush it.

Conquest of Veii

The history of the war against the Veientes, Capenates, and Falisci, and of the siege of Veii, which is said, like that of Troy, to have lasted ten years, rests on evidence far from trustworthy. Legend and poetry have taken possession of these events as their own, and with reason; for the struggle in this case was waged, with unprecedented exertions, for an unprecedented prize. It was the first occasion on which a Roman army remained in the field summer and winter, year after year, till its object was attained. It was the first occasion on which the community paid the levy from the resources of the state. But it was also the first occasion on which the Romans attempted to subdue a nation of alien stock, and carried their arms beyond the ancient northern boundary of the Latin land. The struggle was vehement, but the issue was scarcely doubtful. The Romans were supported by the Latins and Hernici, to whom the overthrow of their dreaded neighbour was productive of scarcely less satisfaction and advantage than to the Romans themselves; whereas Veii was abandoned by its own nation, and only the adjacent towns of Capena and Falerii, along with Tarquinii, furnished contingents to its help. The contemporary attacks of the Celts would alone suffice to explain the nonintervention of the northern communities; it is affirmed however, and there is no reason to doubt, that this inaction of the other Etruscans was primarily occasioned by internal factions in the league of the Etruscan cities, and particularly by the opposition which the regal form of government retained or restored by the Veientes encountered from the aristocratic governments of the other cities. Had the Etruscan nation been able or willing to take part in the conflict, the Roman community would hardly have been able—undeveloped as was the art of besieging at that time—to accomplish the gigantic task of subduing a large and strong city. But isolated and forsaken as Veii was, it succumbed (358) after a valiant resistance

Page 300

to the persevering and heroic spirit of Marcus Furius Camillus, who first opened up to his countrymen the brilliant and perilous career of foreign conquest. The joy which this great success excited in Rome had its echo in the Roman custom, continued down to a late age, of concluding the festal games with a “sale of Veientes,” at which, among the mock spoils submitted to auction, the most wretched old cripple who could be procured wound up the sport in a purple mantle and ornaments of gold as “king of the Veientes.” The city was destroyed, and the soil was doomed to perpetual desolation. Falerii and Capena hastened to make peace; the powerful Volsinii, which with federal indecision had remained quiet during the agony of Veii and took up arms after its capture, likewise after a few years (363) consented to peace. The statement that the two bulwarks of the Etruscan nation, Melpum and Veii, yielded on the same day, the former to the Celts, the latter to the Romans, may be merely a melancholy legend; but it at any rate involves a deep historical truth. The double assault from the north and from the south, and the fall of the two frontier strongholds, were the beginning of the end of the great Etruscan nation.

The Celts Attack Rome—
Battle on the Allia—
Capture of Rome

For a moment, however, it seemed as if the two peoples, through whose co-operation Etruria saw her very existence put in jeopardy, were about to destroy each other, and the reviving power of Rome was to be trodden under foot by foreign barbarians. This turn of things, so contrary to what might naturally have been expected, the Romans brought upon themselves by their own arrogance and shortsightedness.

The Celtic swarms, which had crossed the river after the fall of Melpum, rapidly overflowed northern Italy—not merely the open country on the right bank of the Po and along the shore of the Adriatic, but also Etruria proper to the south of the Apennines. A few years afterwards (363) Clusium situated in the heart of Etruria (Chiusi, on the borders of Tuscany and the Papal State) was besieged by the Celtic Senones; and so humbled were the Etruscans that the Tuscan city in its straits invoked aid from the destroyers of Veii. Perhaps it would have been wise to grant it and to reduce at once the Gauls by arms, and the Etruscans by according to them protection, to a state of dependence on Rome; but an intervention with aims so extensive, which would have compelled the Romans to undertake a serious struggle on the northern Tuscan frontier, lay beyond the horizon of the Roman policy at that time. No course was therefore left but to refrain from all interference. Foolishly, however, while declining to send auxiliary troops, they despatched envoys. With still greater folly these sought to impose upon the Celts by haughty language, and, when this failed, they conceived that they might with impunity violate the law of nations in dealing with barbarians; in

Page 301

the ranks of the Clusines they took part in a skirmish, and in the course of it one of them stabbed and dismounted a Gallic officer. The barbarians acted in this case with moderation and prudence. They sent in the first instance to the Roman community to demand the surrender of those who had outraged the law of nations, and the senate was ready to comply with the reasonable request. But with the multitude compassion for their countrymen outweighed justice towards the foreigners; satisfaction was refused by the burgesses; and according to some accounts they even nominated the brave champions of their fatherland as consular tribunes for the year 364,(9) which was to be so fatal in the Roman annals. Then the Brennus or, in other words, the “king of the army” of the Gauls broke up the siege of Clusium, and the whole Celtic host—the numbers of which are stated at 70,000 men—turned against Rome. Such expeditions into unknown land distant regions were not unusual for the Gauls, who marched as bands of armed emigrants, troubling themselves little as to the means of cover or of retreat; but it was evident that none in Rome anticipated the dangers involved in so sudden and so mighty an invasion. It was not till the Gauls were marching upon Rome that a Roman military force crossed the Tiber and sought to bar their way. Not twelve miles from the gates, opposite to the confluence of the rivulet Allia with the Tiber, the armies met, and a battle took place on the 18th July, 364. Even now they went into battle—not as against an army, but as against freebooters—with arrogance and foolhardiness and under inexperienced leaders, Camillus having in consequence of the dissensions of the orders withdrawn from taking part in affairs. Those against whom they were to fight were but barbarians; what need was there of a camp, or of securing a retreat? These barbarians, however, were men whose courage despised death, and their mode of fighting was to the Italians as novel as it was terrible; sword in hand the Celts precipitated themselves with furious onset on the Roman phalanx, and shattered it at the first shock. The overthrow was complete; of the Romans, who had fought with the river in their rear, a large portion met their death in the attempt to cross it; such as escaped threw themselves by a flank movement into the neighbouring Veii. The victorious Celts stood between the remnant of the beaten army and the capital. The latter was irretrievably abandoned to the enemy; the small force that was left behind, or that had fled thither, was not sufficient to garrison the walls, and three days after the battle the victors marched through the open gates into Rome. Had they done so at first, as they might have done, not only the city, but the state also must have been lost; the brief interval gave opportunity to carry away or to bury the sacred objects, and, what was more important, to occupy the citadel and to furnish it with provisions for the exigency. No one was

Page 302

admitted to the citadel who was incapable of bearing arms—there was not food for all. The mass of the defenceless dispersed among the neighbouring towns; but many, and in particular a number of old men of high standing, would not survive the downfall of the city and awaited death in their houses by the sword of the barbarians. They came, murdered all they met with, plundered whatever property they found, and at length set the city on fire on all sides before the eyes of the Roman garrison in the Capitol. But they had no knowledge of the art of besieging, and the blockade of the steep citadel rock was tedious and difficult, because subsistence for the great host could only be procured by armed foraging parties, and the citizens of the neighbouring Latin cities, the Ardeates in particular, frequently attacked the foragers with courage and success. Nevertheless the Celts persevered, with an energy which in their circumstances was unparalleled, for seven months beneath the rock, and the garrison, which had escaped a surprise on a dark night only in consequence of the cackling of the sacred geese in the Capitoline temple and the accidental awaking of the brave Marcus Manlius, already found its provisions beginning to fail, when the Celts received information as to the Veneti having invaded the Senonian territory recently acquired on the Po, and were thus induced to accept the ransom money that was offered to procure their withdrawal. The scornful throwing down of the Gallic sword, that it might be outweighed by Roman gold, indicated very truly how matters stood. The iron of the barbarians had conquered, but they sold their victory and by selling lost it.

Fruitlessness of the Celtic Victory

The fearful catastrophe of the defeat and the conflagration, the 18th of July and the rivulet of the Allia, the spot where the sacred objects were buried, and the spot where the surprise of the citadel had been repulsed—all the details of this unparalleled event—were transferred from the recollection of contemporaries to the imagination of posterity; and we can scarcely realize the fact that two thousand years have actually elapsed since those world-renowned geese showed greater vigilance than the sentinels at their posts. And yet—although there was an enactment in Rome that in future, on occasion of a Celtic invasion no legal privilege should give exemption from military service; although dates were reckoned by the years from the conquest of the city; although the event resounded throughout the whole of the then civilized world and found its way even into the Grecian annals—the battle of the Allia and its results can scarcely be numbered among those historical events that are fruitful of consequences. It made no alteration at all in political relations. When the Gauls had marched off again with their gold—which only a legend of late and wretched invention represents the hero Camillus as having recovered for Rome—and when the fugitives had again made their way home,

Page 303

the foolish idea suggested by some faint-hearted prudential politicians, that the citizens should migrate to Veii, was set aside by a spirited speech of Camillus; houses arose out of the ruins hastily and irregularly—the narrow and crooked streets of Rome owed their origin to this epoch; and Rome again stood in her old commanding position. Indeed it is not improbable that this occurrence contributed materially, though not just at the moment, to diminish the antagonism between Rome and Etruria, and above all to knit more closely the ties of union between Latium and Rome. The conflict between the Gauls and the Romans was not, like that between Rome and Etruria or between Rome and Samnium, a collision of two political powers which affect and modify each other; it may be compared to those catastrophes of nature, after which the organism, if it is not destroyed, immediately resumes its equilibrium. The Gauls often returned to Latium: as in the year 387, when Camillus defeated them at Alba—the last victory of the aged hero, who had been six times military tribune with consular powers, and five times dictator, and had four times marched in triumph to the Capitol; in the year 393, when the dictator Titus Quinctius Pennus encamped opposite to them not five miles from the city at the bridge of the Anio, but before any encounter took place the Gallic host marched onward to Campania; in the year 394, when the dictator Quintus Servilius Ahala fought in front of the Colline gate with the hordes returning from Campania; in the year 396, when the dictator Gaius Sulpicius Peticus inflicted on them a signal defeat; in the year 404, when they even spent the winter encamped upon the Alban mount and joined with the Greek pirates along the coast for plunder, till Lucius Furius Camillus, the son of the celebrated general, in the following year dislodged them—an incident which came to the ears of Aristotle who was contemporary (370-432) in Athens. But these predatory expeditions, formidable and troublesome as they may have been, were rather incidental misfortunes than events of political significance; and their most essential result was, that the Romans were more and more regarded by themselves and by foreigners as the bulwark of the civilized nations of Italy against the onset of the dreaded barbarians—a view which tended more than is usually supposed to further their subsequent claim to universal empire.

Further Conquests of Rome in Etruria— South Etruria Roman

The Tuscans, who had taken advantage of the Celtic attack on Rome to assail Veii, had accomplished nothing, because they had appeared in insufficient force; the barbarians had scarcely departed, when the heavy arm of Latium descended on the Tuscans with undiminished weight. After the Etruscans had been repeatedly defeated, the whole of southern Etruria as far as the Ciminian hills remained in the hands of the Romans, who formed four new tribes in the territories of Veii,

Page 304

Capena, and Falerii (367), and secured the northern boundary by establishing the fortresses of Sutrium (371) and Nepete (381). With rapid steps this fertile region, covered with Roman colonists, became completely Romanized. About 396 the nearest Etruscan towns, Tarquinii, Caere, and Falerii, attempted to revolt against the Roman encroachments, and the deep exasperation which these had aroused in Etruria was shown by the slaughter of the whole of the Roman prisoners taken in the first campaign, three hundred and seven in number, in the market-place of Tarquinii; but it was the exasperation of impotence. In the peace (403) Caere, which as situated nearest to the Romans suffered the heaviest retribution, was compelled to cede half its territory to Rome, and with the diminished domain which was left to it to withdraw from the Etruscan league, and to enter into the relationship of subjects to Rome which had in the meanwhile been constituted primarily for individual Latin communities. It seemed, however, not advisable to leave to this more remote community alien in race from the Roman such communal independence as was still retained by the subject communities of Latium; the Caerite community received the Roman franchise not merely without the privilege of electing or of being elected at Rome, but also subject to the withholding of self-administration, so that the place of magistrates of its own was as regards justice and the census taken by those of Rome, and a representative (-praefectus-) of the Roman praetor conducted the administration on the spot—a form of subjection, which in state-law first meets us here, whereby a state which had hitherto been independent became converted into a community continuing to subsist -de jure-, but deprived of all power of movement on its own part. Not long afterwards (411) Falerii, which had preserved its original Latin nationality even under Tuscan rule, abandoned the Etruscan league and entered into perpetual alliance with Rome; and thereby the whole of southern Etruria became in one form or other subject to Roman supremacy. In the case of Tarquinii and perhaps of northern Etruria generally, the Romans were content with restraining them for a lengthened period by a treaty of peace for 400 months (403).

Pacification of Northern Italy

In northern Italy likewise the peoples that had come into collision and conflict gradually settled on a permanent footing and within more defined limits. The migrations over the Alps ceased, partly perhaps in consequence of the desperate defence which the Etruscans made in their more restricted home, and of the serious resistance of the powerful Romans, partly perhaps also in consequence of changes unknown to us on the north of the Alps. Between the Alps and the Apennines, as far south as the Abruzzi, the Celts were now generally the ruling nation, and they were masters more especially of the plains and rich pastures; but from the lax and superficial nature of their settlement their dominion

Page 305

took no deep root in the newly acquired land and by no means assumed the shape of exclusive possession. How matters stood in the Alps, and to what extent Celtic settlers became mingled there with earlier Etruscan or other stocks, our unsatisfactory information as to the nationality of the later Alpine peoples does not permit us to ascertain; only the Raeti in the modern Grisons and Tyrol may be described as a probably Etruscan stock. The Umbrians retained the valleys of the Apennines, and the Veneti, speaking a different language, kept possession of the north-eastern portion of the valley of the Po. Ligurian tribes maintained their footing in the western mountains, dwelling as far south as Pisa and Arezzo, and separating the Celt-land proper from Etruria. The Celts dwelt only in the intermediate flat country, the Insubres and Cenomani to the north of the Po, the Boii to the south, and—not to mention smaller tribes—the Senones on the coast of the Adriatic, from Ariminum to Ancona, in the so-called “country of the Gauls” (-ager Gallicus-). But even there Etruscan settlements must have continued partially at least to subsist, somewhat as Ephesus and Miletus remained Greek under the supremacy of the Persians. Mantua at any rate, which was protected by its insular position, was a Tuscan city even in the time of the empire, and Atria on the Po also, where numerous discoveries of vases have been made, appears to have retained its Etruscan character; the description of the coasts that goes under the name of Scylax, composed about 418, calls the district of Atria and Spina Tuscan land. This alone, moreover, explains how Etruscan corsairs could render the Adriatic unsafe till far into the fifth century, and why not only Dionysius of Syracuse covered its coasts with colonies, but even Athens, as a remarkable document recently discovered informs us, resolved about 429 to establish a colony in the Adriatic for the protection of seafarers against the Tyrrhene pirates.

But while more or less of an Etruscan character continued to mark these regions, it was confined to isolated remnants and fragments of their earlier power; the Etruscan nation no longer reaped the benefit of such gains as were still acquired there by individuals in peaceful commerce or in maritime war. On the other hand it was probably from these half-free Etruscans that the germs proceeded of such civilization as we subsequently find among the Celts and Alpine peoples in general.(10) The very fact that the Celtic hordes in the plains of Lombardy, to use the language of the so-called Scylax, abandoned their warrior-life and took to permanent settlement, must in part be ascribed to this influence; the rudiments moreover of handicrafts and arts and the alphabet came to the Celts in Lombardy, and in fact to the Alpine peoples as far as the modern Styria, through the medium of the Etruscans.

Etruria Proper at Peace and on the Decline

Page 306

Thus the Etruscans, after the loss of their possessions in Campania and of the whole district to the north of the Apennines and to the south of the Ciminian Forest, remained restricted to very narrow bounds; their season of power and of aspiration had for ever passed away. The closest reciprocal relations subsisted between this external decline and the internal decay of the nation, the seeds of which indeed were doubtless already deposited at a far earlier period. The Greek authors of this age are full of descriptions of the unbounded luxury of Etruscan life: poets of Lower Italy in the fifth century of the city celebrate the Tyrrhenian wine, and the contemporary historians Timaeus and Theopompus delineate pictures of Etruscan unchastity and of Etruscan banquets, such as fall nothing short of the worst Byzantine or French demoralization. Unattested as may be the details in these accounts, the statement at least appears to be well founded, that the detestable amusement of gladiatorial combats—the gangrene of the later Rome and of the last epoch of antiquity generally—first came into vogue among the Etruscans. At any rate on the whole they leave no doubt as to the deep degeneracy of the nation. It pervaded even its political condition. As far as our scanty information reaches, we find aristocratic tendencies prevailing, in the same way as they did at the same period in Rome, but more harshly and more perniciously. The abolition of royalty, which appears to have been carried out in all the cities of Etruria about the time of the siege of Veii, called into existence in the several cities a patrician government, which experienced but slight restraint from the laxity of the federal bond. That bond but seldom succeeded in combining all the Etruscan cities even for the defence of the land, and the nominal hegemony of Volsinii does not admit of the most remote comparison with the energetic vigour which the leadership of Rome communicated to the Latin nation. The struggle against the exclusive claim put forward by the old burgesses to all public offices and to all public usufructs, which must have destroyed even the Roman state, had not its external successes enabled it in some measure to satisfy the demands of the oppressed proletariat at the expense of foreign nations and to open up other paths to ambition—that struggle against the exclusive rule and (what was specially prominent in Etruria) the priestly monopoly of the clan-nobility—must have ruined Etruria politically, economically, and morally. Enormous wealth, particularly in landed property, became concentrated in the hands of a few nobles, while the masses were impoverished; the social revolutions which thence arose increased the distress which they sought to remedy; and, in consequence of the impotence of the central power, no course at last remained to the distressed aristocrats—e. g. in Arretium in 453, and in Volsinii in 488—but to call in the aid of the Romans, who accordingly put an end to the disorder but at the same time extinguished the remnant of independence. The energies of the nation were broken from the day of Veii and Melpum. Earnest attempts were still once or twice made to escape from the Roman supremacy, but in such instances the stimulus was communicated to the Etruscans from without—from another Italian stock, the Samnites.

Notes for Book II Chapter IV

1. I. X. Phoenicians and Italians in Opposition to the Hellenes
 2. —Fiaron o Deinomeneos kai toi Surakosioi toi Di Turan apo Kumas.—
 3. I. X. Home of the Greek Immigrants
 4. Hecataeus (after 257 u. c.) and Herodotus also (270-after 345) only know Hatrias as the delta of the Po and the sea that washes its shores (O. Muller, Etrusker, i. p. 140; Geogr. Graeci min. ed. C. Muller, i. p. 23). The appellation of Adriatic sea, in its more extended sense, first occurs in the so-called Scylax about 418 U. C.
 5. II. II. Coriolanus
 6. -Pleraque Gallia duas res industriosissime persequitur: rem militarem et argute loqui- (Cato, Orig, I. ii. fr. 2. Jordan).
 7. It has recently been maintained by expert philologists that there is a closer affinity between the Celts and Italians than there is even between the latter and the Hellenes. In other words they hold that the branch of the great tree, from which the peoples of Indo-Germanic extraction in the west and south of Europe have sprung, divided itself in the first instance into Greeks and Italo-Celts, and that the latter at a considerably later period became subdivided into Italians and Celts. This hypothesis commends itself much to acceptance in a geographical point of view, and the facts which history presents may perhaps be likewise brought into harmony with it, because what has hitherto been regarded as Graeco-Italian civilization may very well have been Graeco-Celto-Italian—in fact we know nothing of the earliest stage of Celtic culture. Linguistic investigation, however, seems not to have made as yet such progress as to warrant the insertion of its results in the primitive history of the peoples.
 8. The legend is related by Livy, v. 34, and Justin, xxiv. 4, and Caesar also has had it in view (B. G. vi. 24). But the association of the migration of Bellovesus with the founding of Massilia, by which the former is chronologically fixed down to the middle of the second century of Rome, undoubtedly belongs not to the native legend, which of course did not specify dates, but to later chronologizing research; and it deserves no credit. Isolated incursions and immigrations may have taken place at a very early period; but the great overflowing of northern Italy by the Celts cannot be placed before the age of the decay of the Etruscan power, that is, not before the second half of the third century of the city.
- In like manner, after the judicious investigations of Wickham and Cramer, we cannot doubt that the line of march of Bellovesus, like that of Hannibal, lay not over the Cottian Alps (Mont Genevre) and through the territory of the Taurini, but over the Graian Alps

(the Little St. Bernard) and through the territory of the Salassi. The name of the mountain is given by Livy doubtless not on the authority of the legend, but on his own conjecture.

Page 308

Whether the representation that the Italian Boii came through the more easterly pass of the Poenine Alps rested on the ground of a genuine legendary reminiscence, or only on the ground of an assumed connection with the Boii dwelling to the north of the Danube, is a question that must remain undecided.

9. This is according to the current computation 390 B. C.; but, in fact, the capture of Rome occurred in Ol. 98, 1 = 388 B. C., and has been thrown out of its proper place merely by the confusion of the Roman calendar.

CHAPTER V

Subjugation of the Latins and Campanians by Rome

The Hegemony of Rome over Latium Shaken and Re-established

The great achievement of the regal period was the establishment of the sovereignty of Rome over Latium under the form of hegemony. It is in the nature of the case evident that the change in the constitution of Rome could not but powerfully affect both the relations of the Roman state towards Latium and the internal organization of the Latin communities themselves; and that it did so, is obvious from tradition. The fluctuations which the revolution in Rome occasioned in the Romano-Latin confederacy are attested by the legend, unusually vivid and various in its hues, of the victory at the lake Regillus, which the dictator or consul Aulus Postumius (255? 258?) is said to have gained over the Latins with the help of the Dioscuri, and still more definitely by the renewal of the perpetual league between Rome and Latium by Spurius Cassius in his second consulate (261). These narratives, however, give us no information as to the main matter, the legal relation between the new Roman republic and the Latin confederacy; and what from other sources we learn regarding that relation comes to us without date, and can only be inserted here with an approximation to probability.

Original Equality of Rights between Rome and Latium

The nature of a hegemony implies that it becomes gradually converted into sovereignty by the mere inward force of circumstances; and the Roman hegemony over Latium formed no exception to the rule. It was based upon the essential equality of rights between the Roman state on the one side and the Latin confederacy on the other;(1) but at least in matters of war and in the treatment of the acquisitions thereby made this relation between the single state on the one hand and the league of states on the other virtually involved a hegemony. According to the original constitution of the league not

only was the right of making wars and treaties with foreign states—in other words, the full right of political self-determination—reserved in all probability both to Rome and to the individual towns of the Latin league; and when a joint war took place, Rome and Latium probably furnished the like

Page 309

contingent, each, as a rule, an “army” of 8400 men;(2) but the chief command was held by the Roman general, who then nominated the officers of the staff, and so the leaders-of-division (-tribuni militum-), according to his own choice. In case of victory the moveable part of the spoil, as well as the conquered territory, was shared between Rome and the confederacy; when the establishment of fortresses in the conquered territory was resolved on, their garrisons and population were composed partly of Roman, partly of confederate colonists; and not only so, but the newly-founded community was received as a sovereign federal state into the Latin confederacy and furnished with a seat and vote in the Latin diet.

Encroachments on That Equality of Rights—

As to Wars and Treaties—

As to the Officering of the Army—

As to Acquisitions in War

These stipulations must probably even in the regal period, certainly in the republican epoch, have undergone alteration more and more to the disadvantage of the confederacy and to the further development of the hegemony of Rome. The earliest that fell into abeyance was beyond doubt the right of the confederacy to make wars and treaties with foreigners;(3) the decision of war and treaty passed once for all to Rome. The staff officers for the Latin troops must doubtless in earlier times have been likewise Latins; afterwards for that purpose Roman citizens were taken, if not exclusively, at any rate predominantly.(4) On the other hand, afterwards as formerly, no stronger contingent could be demanded from the Latin confederacy as a whole than was furnished by the Roman community; and the Roman commander-in-chief was likewise bound not to break up the Latin contingents, but to keep the contingent sent by each community as a separate division of the army under the leader whom that community had appointed.(5) The right of the Latin confederacy to an equal share in the moveable spoil and in the conquered land continued to subsist in form; in reality, however, the substantial fruits of war beyond doubt went, even at an early period, to the leading state. Even in the founding of the federal fortresses or the so-called Latin colonies as a rule presumably most, and not unfrequently all, of the colonists were Romans; and although by the transference they were converted from Roman burgesses into members of an allied community, the newly planted township in all probability frequently retained a preponderant—and for the confederacy dangerous—attachment to the real mother-city.

Private Rights

The rights, on the contrary, which were secured by the federal treaties to the individual burgess of one of the allied communities in every city belonging to the league, underwent no restriction. These included, in particular, full equality of rights as to the acquisition of landed property and moveable estate, as to traffic and exchange,

marriage and testament, and an unlimited liberty of migration; so that not only was a man who had burgess-rights in a town of the league legally entitled to settle in any other, but wherever he settled, he as a right-sharer (-municeps-) participated in all private and political rights and duties with the exception of eligibility to office, and was even—although in a limited fashion —entitled to vote at least in the -comitia tributa-.(6)

Page 310

Of some such nature, in all probability, was the relation between the Roman community and the Latin confederacy in the first period of the republic. We cannot, however ascertain what elements are to be referred to earlier stipulations, and what to the revision of the alliance in 261.

With somewhat greater certainty the remodelling of the arrangements of the several communities belonging to the Latin confederacy, after the pattern of the consular constitution in Rome, may be characterized as an innovation and introduced in this connection. For, although the different communities may very well have arrived at the abolition of royalty in itself independently of each other,(7) the identity in the appellation of the new annual kings in the Roman and other commonwealths of Latium, and the comprehensive application of the peculiar principle of collegiateness,(8) evidently point to some external connection. At some time or other after the expulsion of the Tarquins from Rome the arrangements of the Latin communities must have been throughout revised in accordance with the scheme of the consular constitution. This adjustment of the Latin constitutions in conformity with that of the leading city may possibly belong only to a later period; but internal probability rather favours the supposition that the Roman nobility, after having effected the abolition of royalty for life at home, suggested a similar change of constitution to the communities of the Latin confederacy, and at length introduced aristocratic government everywhere in Latium— notwithstanding the serious resistance, imperilling the stability of the Romano-Latin league itself, which seems to have been offered on the one hand by the expelled Tarquins, and on the other by the royal clans and by partisans well affected to monarchy in the other communities of Latium. The mighty development of the power of Etruria that occurred at this very time, the constant assaults of the Veientes, and the expedition of Porsena, may have materially contributed to secure the adherence of the Latin nation to the once-established form of union, or, in other words, to the continued recognition of the supremacy of Rome, and disposed them for its sake to acquiesce in a change of constitution for which, beyond doubt, the way had been in many respects prepared even in the bosom of the Latin communities, nay perhaps to submit even to an enlargement of the rights of hegemony.

Extension of Rome and Latium to the East and South

The permanently united nation was able not only to maintain, but also to extend on all sides its power. We have already(9) mentioned that the Etruscans remained only for a short time in possession of supremacy over Latium, and that the relations there soon returned to the position in which they stood during the regal period; but it was not till more than a century after the expulsion of the kings from Rome that any real extension of the Roman boundaries took place in this direction.

Page 311

With the Sabines who occupied the middle mountain range from the borders of the Umbrians down to the region between the Tiber and the Anio, and who, at the epoch when the history of Rome begins, penetrated fighting and conquering as far as Latium itself, the Romans notwithstanding their immediate neighbourhood subsequently came comparatively little into contact. The feeble sympathy of the Sabines with the desperate resistance offered by the neighbouring peoples in the east and south, is evident even from the accounts of the annals; and—what is of more importance—we find here no fortresses to keep the land in subjection, such as were so numerous established especially in the Volscian plain. Perhaps this lack of opposition was connected with the fact that the Sabine hordes probably about this very time poured themselves over Lower Italy. Allured by the pleasantness of the settlements on the Tifernus and Volturnus, they appear to have interfered but little in the conflicts of which the region to the south of the Tiber was the arena.

At the Expense of the Aequi and Volsci—
League with the Hernici

Far more vehement and lasting was the resistance of the Aequi, who, having their settlements to the eastward of Rome as far as the valleys of the Turano and Salto and on the northern verge of the Fucine lake, bordered with the Sabines and Marsi,(10) and of the Volsci, who to the south of the Rutuli settled around Ardea, and of the Latins extending southward as far as Cora, possessed the coast almost as far as the river Liris along with the adjacent islands and in the interior the whole region drained by the Liris. We do not intend to narrate the feuds annually renewed with these two peoples—feuds which are related in the Roman chronicles in such a way that the most insignificant foray is scarcely distinguishable from a momentous war, and historical connection is totally disregarded; it is sufficient to indicate the permanent results. We plainly perceive that it was the especial aim of the Romans and Latins to separate the Aequi from the Volsci, and to become masters of the communications between them; in the region between the southern slope of the Alban range, the Volscian mountains and the Pomptine marshes, moreover, the Latins and the Volscians appear to have come first into contact and to have even had their settlements intermingled.(11) In this region the Latins took the first steps beyond the bounds of their own land, and federal fortresses on foreign soil—Latin colonies, as they were called—were first established, namely: in the plain Velitrae (as is alleged, about 260) beneath the Alban range itself, and Suessa in the Pomptine low lands, in the mountains Norba (as is alleged, in 262) and Signia (alleged to have been strengthened in 259), both of which lie at the points of connection between the Aequian and Volscian territories. The object was attained still more fully by the accession of the Hernici to

Page 312

the league of the Romans and Latins (268), an accession which isolated the Volscians completely, and provided the league with a bulwark against the Sabellian tribes dwelling on the south and east; it is easy therefore to perceive why this little people obtained the concession of full equality with the two others in counsel and in distribution of the spoil. The feeble Aequi were thenceforth but little formidable; it was sufficient to undertake from time to time a plundering expedition against them. The Rutuli also, who bordered with Latium on the south in the plain along the coast, early succumbed; their town Ardea was converted into a Latin colony as early as 312.(12) The Volscians opposed a more serious resistance. The first notable success, after those mentioned above, achieved over them by the Romans was, remarkably enough, the foundation of Circeii in 361, which, as long as Antium and Tarracina continued free, can only have held communication with Latium by sea. Attempts were often made to occupy Antium, and one was temporarily successful in 287; but in 295 the town recovered its freedom, and it was not till after the Gallic conflagration that, in consequence of a violent war of thirteen years (365-377), the Romans gained a decided superiority in the Antiatic and Pomptine territory. Satricum, not far from Antium, was occupied with a Latin colony in 369, and not long afterwards probably Antium itself as well as Tarracina.(13) The Pomptine territory was secured by the founding of the fortress Setia (372, strengthened in 375), and was distributed into farm-allotments and burgess-districts in the year 371 and following years. After this date the Volscians still perhaps rose in revolt, but they waged no further wars against Rome.

Crises within the Romano-Latin League

But the more decided the successes that the league of Romans, Latins, and Hernici achieved against the Etruscans, Aequi, Volsci, and Rutuli, the more that league became liable to disunion. The reason lay partly in the increase of the hegemonic power of Rome, of which we have already spoken as necessarily springing out of the existing circumstances, but which nevertheless was felt as a heavy burden in Latium; partly in particular acts of odious injustice perpetrated by the leading community. Of this nature was especially the infamous sentence of arbitration between the Aricini and the Rutuli in Ardea in 308, in which the Romans, called in to be arbiters regarding a border territory in dispute between the two communities, took it to themselves; and when this decision occasioned in Ardea internal dissensions in which the people wished to join the Volsci, while the nobility adhered to Rome, these dissensions were still more disgracefully employed as a pretext for the—already mentioned—sending of Roman colonists into the wealthy city, amongst whom the lands of the adherents of the party opposed to Rome were distributed (312). The main cause however of the internal breaking up

Page 313

of the league was the very subjugation of the common foe; forbearance ceased on one side, devotedness ceased on the other, from the time when they thought that they had no longer need of each other. The open breach between the Latins and Hernici on the one hand and the Romans on the other was more immediately occasioned partly by the capture of Rome by the Celts and the momentary weakness which it produced, partly by the definitive occupation and distribution of the Pomptine territory. The former allies soon stood opposed in the field. Already Latin volunteers in great numbers had taken part in the last despairing struggle of the Antiates: now the most famous of the Latin cities, Lanuvium (371), Praeneste (372-374, 400), Tusculum (373), Tibur (394, 400), and even several of the fortresses established in the Volscian land by the Romano-Latin league, such as Velitrae and Circeii, had to be subdued by force of arms, and the Tiburtines were not afraid even to make common cause against Rome with the once more advancing hordes of the Gauls. No concerted revolt however took place, and Rome mastered the individual towns without much trouble.

Tusculum was even compelled (in 373) to give up its political independence, and to enter into the burgess-union of Rome as a subject community (-civitas sine suffragio-) so that the town retained its walls and an—although limited—self-administration, including magistrates and a burgess-assembly of its own, whereas its burgesses as Romans lacked the right of electing or being elected—the first instance of a whole burgess-body being incorporated as a dependent community with the Roman commonwealth.

Renewal of the Treaties of Alliance

The struggle with the Hernici was more severe (392-396); the first consular commander-in-chief belonging to the plebs, Lucius Genucius, fell in it; but here too the Romans were victorious. The crisis terminated with the renewal of the treaties between Rome and the Latin and Hernican confederacies in 396. The precise contents of these treaties are not known, but it is evident that both confederacies submitted once more, and probably on harder terms, to the Roman hegemony. The institution which took place in the same year of two new tribes in the Pomptine territory shows clearly the mighty advances made by the Roman power.

Closing of the Latin Confederation

In manifest connection with this crisis in the relations between Rome and Latium stands the closing of the Latin confederation,(14) which took place about the year 370, although we cannot precisely determine whether it was the effect or, as is more probable, the cause of the revolt of Latium against Rome which we have just described. As the law had hitherto stood, every sovereign city founded by Rome and Latium took

its place among the communes entitled to participate in the federal festival and federal diet, whereas every community incorporated with another city and thereby

Page 314

politically annihilated was erased from the ranks of the members of the league. At the same time, however, according to Latin use and wont the number once fixed of thirty confederate communities was so adhered to, that of the participating cities never more and never less than thirty were entitled to vote, and a number of the communities that were of later admission, or were disqualified for their slight importance or for the crimes they had committed, were without the right of voting. In this way the confederacy was constituted about 370 as follows. Of old Latin townships there were—besides some which have now fallen into oblivion, or whose sites are unknown—still autonomous and entitled to vote, Nomentum, between the Tiber and the Anio; Tibur, Gabii, Scaptia, Labici,(15) Pedum, and Praeneste, between the Anio and the Alban range; Corbio, Tusculum, Bovillae, Aricia, Corioli, and Lanuvium on the Alban range; Cora in the Volscian mountains, and lastly, Laurentum in the plain along the coast. To these fell to be added the colonies instituted by Rome and the Latin league; Ardea in the former territory of the Rutuli, and Satricum, Velitrae, Norba, Signia, Setia and Circeii in that of the Volsci. Besides, seventeen other townships, whose names are not known with certainty, had the privilege of participating in the Latin festival without the right of voting. On this footing—of forty-seven townships entitled to participate and thirty entitled to vote—the Latin confederacy continued henceforward unalterably fixed. The Latin communities founded subsequently, such as Sutrium, Nepete,(16) Antium, Tarracina, (17) and Gales, were not admitted into the confederacy, nor were the Latin communities subsequently divested of their autonomy, such as Tusculum and Lanuvium, erased from the list.

Fixing of the Limits of Latium

With this closing of the confederacy was connected the geographical settlement of the limits of Latium. So long as the Latin confederacy continued open, the bounds of Latium had advanced with the establishment of new federal cities: but as the later Latin colonies had no share in the Alban festival, they were not regarded geographically as part of Latium. For this reason doubtless Ardea and Circeii were reckoned as belonging to Latium, but not Sutrium or Tarracina.

Isolation of the Later Latin Cities as Respected Private Rights

But not only were the places on which Latin privileges were bestowed after 370 kept aloof from the federal association; they were isolated also from one another as respected private rights. While each of them was allowed to have reciprocity of commercial dealings and probably also of marriage (-commercium et conubium-) with Rome, no such reciprocity was permitted with the other Latin communities. The burgess of Satrium, for example, might possess in full property a piece of ground in Rome, but not in Praeneste; and might have legitimate children with a Roman, but not with a Tiburtine, wife.(18)

Page 315

Prevention of Special Leagues

If hitherto considerable freedom of movement had been allowed within the confederacy, and for example the six old Latin communities, Aricia, Tusculum, Tibur, Lanuvium, Cora, and Laurentum, and the two new Latin, Ardea and Suessa Pometia, had been permitted to found in common a shrine for the Aricine Diana; it is doubtless not the mere result of accident that we find no further instance in later times of similar separate confederations fraught with danger to the hegemony of Rome.

Revision of the Municipal Constitutions. Police Judges

We may likewise assign to this epoch the further remodelling which the Latin municipal constitutions underwent, and their complete assimilation to the constitution of Rome. If in after times two aediles, intrusted with the police-supervision of markets and highways and the administration of justice in connection therewith, make their appearance side by side with the two praetors as necessary elements of the Latin magistracy, the institution of these urban police functionaries, which evidently took place at the same time and at the instigation of the leading power in all the federal communities, certainly cannot have preceded the establishment of the curule aedileship in Rome, which occurred in 387; probably it took place about that very time. Beyond doubt this arrangement was only one of a series of measures curtailing the liberties and modifying the organization of the federal communities in the interest of aristocratic policy.

Domination of the Romans; Exasperation of the Latins— Collision between the Romans and the Samnites

After the fall of Veii and the conquest of the Pomptine territory, Rome evidently felt herself powerful enough to tighten the reins of her hegemony and to reduce the whole of the Latin cities to a position so dependent that they became in fact completely subject. At this period (406) the Carthaginians, in a commercial treaty concluded with Rome, bound themselves to inflict no injury on the Latins who were subject to Rome, viz. the maritime towns of Ardea, Antium, Circeii, and Tarracina; if, however, any one of the Latin towns should fall away from the Roman alliance, the Phoenicians were to be allowed to attack it, but in the event of conquering it they were bound not to raze it, but to hand it over to the Romans. This plainly shows by what chains the Roman community bound to itself the towns protected by it and how much a town, which dared to withdraw from the native protectorate, sacrificed or risked by such a course.

It is true that even now the Latin confederacy at least—if not also the Hernican—retained its formal title to a third of the gains of war, and doubtless some other remnants of the former equality of rights; but what was palpably lost was important enough to explain the exasperation which at this period prevailed among the Latins against Rome. Not only did numerous Latin volunteers fight under foreign

Page 316

standards against the community at their head, wherever they found armies in the field against Rome; but in 405 even the Latin federal assembly resolved to refuse to the Romans its contingent. To all appearance a renewed rising of the whole Latin confederacy might be anticipated at no distant date; and at that very moment a collision was imminent with another Italian nation, which was able to encounter on equal terms the united strength of the Latin stock. After the overthrow of the northern Volscians no considerable people in the first instance opposed the Romans in the south; their legions unchecked approached the Liris. As early as 397 they had contended; successfully with the Privernates; and in 409 occupied Sora on the upper Liris. Thus the Roman armies had reached the Samnite frontier; and the friendly alliance, which the two bravest and most powerful of the Italian nations concluded with each other in 400, was the sure token of an approaching struggle for the supremacy of Italy—a struggle which threatened to become interwoven with the crisis within the Latin nation.

Conquests of the Samnites in the South of Italy

The Samnite nation, which, at the time of the expulsion of the Tarquins from Rome, had doubtless already been for a considerable period in possession of the hill-country which rises between the Apulian and Campanian plains and commands them both, had hitherto found its further advance impeded on the one side by the Daunians—the power and prosperity of Arpi fall within this period—on the other by the Greeks and Etruscans. But the fall of the Etruscan power towards the end of the third, and the decline of the Greek colonies in the course of the fourth century, made room for them towards the west and south; and now one Samnite host after another marched down to, and even moved across, the south Italian seas. They first made their appearance in the plain adjoining the bay, with which the name of the Campanians has been associated from the beginning of the fourth century; the Etruscans there were suppressed, and the Greeks were confined within narrower bounds; Capua was wrested from the former (330), Cumae from the latter (334). About the same time, perhaps even earlier, the Lucanians appeared in Magna Graecia: at the beginning of the fourth century they were involved in conflict with the people of Terina and Thurii; and a considerable time before 364 they had established themselves in the Greek Laus. About this period their levy amounted to 30,000 infantry and 4000 cavalry. Towards the end of the fourth century mention first occurs of the separate confederacy of the Bruttii,(19) who had detached themselves from the Lucanians—not, like the other Sabellian stocks, as a colony, but through a quarrel—and had become mixed up with many foreign elements. The Greeks of Lower Italy tried to resist the pressure of the barbarians; the league of the Achaean cities was reconstructed in 361; and it was determined that, if any of the allied

Page 317

towns should be assailed by the Lucanians, all should furnish contingents, and that the leaders of contingents which failed to appear should suffer the punishment of death. But even the union of Magna Graecia no longer availed; for the ruler of Syracuse, Dionysius the Elder, made common cause with the Italians against his countrymen. While Dionysius wrested from the fleets of Magna Graecia the mastery of the Italian seas, one Greek city after another was occupied or annihilated by the Italians. In an incredibly short time the circle of flourishing cities was destroyed or laid desolate. Only a few Greek settlements, such as Neapolis, succeeded with difficulty, and more by means of treaties than by force of arms, in preserving at least their existence and their nationality. Tarentum alone remained thoroughly independent and powerful, maintaining its ground in consequence of its more remote position and its preparation for war—the result of its constant conflicts with the Messapians. Even that city, however, had constantly to fight for its existence with the Lucanians, and was compelled to seek for alliances and mercenaries in the mother-country of Greece.

About the period when Veii and the Pomptine plain came into the hands of Rome, the Samnite hordes were already in possession of all Lower Italy, with the exception of a few unconnected Greek colonies, and of the Apulo-Messapian coast. The Greek *Periplus*, composed about 418, sets down the Samnites proper with their “five tongues” as reaching from the one sea to the other; and specifies the Campanians as adjoining them on the Tyrrhene sea to the north, and the Lucanians to the south, amongst whom in this instance, as often, the Bruttii are included, and who already had the whole coast apportioned among them from Paestum on the Tyrrhene, to Thurii on the Ionic sea. In fact to one who compares the achievements of the two great nations of Italy, the Latins and the Samnites, before they came into contact, the career of conquest on the part of the latter appears far wider and more splendid than that of the former. But the character of their conquests was essentially different. From the fixed urban centre which Latium possessed in Rome the dominion of the Latin stock spread slowly on all sides, and lay within limits comparatively narrow; but it planted its foot firmly at every step, partly by founding fortified towns of the Roman type with the rights of dependent allies, partly by Romanizing the territory which it conquered. It was otherwise with Samnium. There was in its case no single leading community and therefore no policy of conquest. While the conquest of the Veientine and Pomptine territories was for Rome a real enlargement of power, Samnium was weakened rather than strengthened by the rise of the Campanian cities and of the Lucanian and Bruttian confederacies; for every swarm, which had sought and found new settlements, thenceforward pursued a path of its own.

Page 318

Relations between the Samnites and the Greeks

The Samnite tribes filled a disproportionately large space, while yet they showed no disposition to make it thoroughly their own. The larger Greek cities, Tarentum, Thurii, Croton, Metapontum, Heraclea, Rhegium, and Neapolis, although weakened and often dependent, continued to exist; and the Hellenes were tolerated even in the open country and in the smaller towns, so that Cumae for instance, Posidonia, Laus, and Hipponium, still remained—as the Periplus already mentioned and coins show—Greek cities even under Samnite rule. Mixed populations thus arose; the bi-lingual Bruttii, in particular, included Hellenic as well as Samnite elements and even perhaps remains of the ancient autochthones; in Lucania and Campania also similar mixtures must to a lesser extent have taken place.

Campanian Hellenism

The Samnite nation, moreover, could not resist the dangerous charm of Hellenic culture; least of all in Campania, where Neapolis early entered into friendly intercourse with the immigrants, and where the sky itself humanized the barbarians. Nola, Nuceria, and Teanum, although having a purely Samnite population, adopted Greek manners and a Greek civic constitution; in fact the indigenous cantonal form of constitution could not possibly subsist under these altered circumstances. The Samnite cities of Campania began to coin money, in part with Greek inscriptions; Capua became by its commerce and agriculture the second city in Italy in point of size—the first in point of wealth and luxury. The deep demoralization, in which, according to the accounts of the ancients, that city surpassed all others in Italy, is especially reflected in the mercenary recruiting and in the gladiatorial sports, both of which pre-eminently flourished in Capua. Nowhere did recruiting officers find so numerous a concourse as in this metropolis of demoralized civilization; while Capua knew not how to save itself from the attacks of the aggressive Samnites, the warlike Campanian youth flocked forth in crowds under self-elected -condottieri-, especially to Sicily. How deeply these soldiers of fortune influenced by their enterprises the destinies of Italy, we shall have afterwards to show; they form as characteristic a feature of Campanian life as the gladiatorial sports which likewise, if they did not originate, were at any rate carried to perfection in Capua. There sets of gladiators made their appearance even during banquets; and their number was proportioned to the rank of the guests invited. This degeneracy of the most important Samnite city—a degeneracy which beyond doubt was closely connected with the Etruscan habits that lingered there—must have been fatal for the nation at large; although the Campanian nobility knew how to combine chivalrous valour and high mental culture with the deepest moral corruption, it could never become to its nation what the Roman nobility was to the Latin. Hellenic influence had a similar,

Page 319

though less powerful, effect on the Lucanians and Bruttians as on the Campanians. The objects discovered in the tombs throughout all these regions show how Greek art was cherished there in barbaric luxuriance; the rich ornaments of gold and amber and the magnificent painted pottery, which are now disinterred from the abodes of the dead, enable us to conjecture how extensive had been their departure from the ancient manners of their fathers. Other indications are preserved in their writing. The old national writing which they had brought with them from the north was abandoned by the Lucanians and Bruttians, and exchanged for Greek; while in Campania the national alphabet, and perhaps also the language, developed itself under the influence of the Greek model into greater clearness and delicacy. We meet even with isolated traces of the influence of Greek philosophy.

The Samnite Confederacy

The Samnite land, properly so called, alone remained unaffected by these innovations, which, beautiful and natural as they may to some extent have been, powerfully contributed to relax still more the bond of national unity which even from the first was loose. Through the influence of Hellenic habits a deep schism took place in the Samnite stock. The civilized "Philhellenes" of Campania were accustomed to tremble like the Hellenes themselves before the ruder tribes of the mountains, who were continually penetrating into Campania and disturbing the degenerate earlier settlers. Rome was a compact state, having the strength of all Latium at its disposal; its subjects might murmur, but they obeyed. The Samnite stock was dispersed and divided; and, while the confederacy in Samnium proper had preserved unimpaired the manners and valour of their ancestors, they were on that very account completely at variance with the other Samnite tribes and towns.

Submission of Capua to Rome—
Rome and Samnium Come to Terms—
Revolt of the Latins and Campanians against Rome—
Victory of the Romans—
Dissolution of the Latin League—
Colonization of the Land of the Volsci

In fact, it was this variance between the Samnites of the plain and the Samnites of the mountains that led the Romans over the Liris. The Sidicini in Teanum, and the Campanians in Capua, sought aid from the Romans (411) against their own countrymen, who in swarms ever renewed ravaged their territory and threatened to establish themselves there. When the desired alliance was refused, the Campanian envoys made offer of the submission of their country to the supremacy of Rome: and the Romans were unable to resist the bait. Roman envoys were sent to the Samnites to inform them of the new acquisition, and to summon them to respect the territory of the

friendly power. The further course of events can no longer be ascertained in detail;(20) we discover only that—whether after a campaign, or without the intervention of a war—Rome and Samnium came to an agreement, by which Capua was left at the disposal of the Romans, Teanum in the hands of the Samnites, and the upper Liris in those of the Volscians.

Page 320

The consent of the Samnites to treat is explained by the energetic exertions made about this very period by the Tarentines to get quit of their Sabellian neighbours. But the Romans also had good reason for coming to terms as quickly as possible with the Samnites; for the impending transition of the region bordering on the south of Latium into the possession of the Romans converted the ferment that had long existed among the Latins into open insurrection. All the original Latin towns, even the Tusculans who had been received into the burgess-union of Rome, took up arms against Rome, with the single exception of the Laurentes, whereas of the colonies founded beyond the bounds of Latium only the old Volscian towns Velitrae, Antium, and Tarracina adhered to the revolt. We can readily understand how the Capuans, notwithstanding their very recent and voluntarily offered submission to the Romans, should readily embrace the first opportunity of again ridding themselves of the Roman rule and, in spite of the opposition of the optimate party that adhered to the treaty with Rome, should make common cause with the Latin confederacy, whereas the still independent Volscian towns, such as Fundi and Formiae, and the Hernici abstained like the Campanian aristocracy from taking part in this revolt. The position of the Romans was critical; the legions which had crossed the Liris and occupied Campania were cut off by the revolt of the Latins and Volsci from their home, and a victory alone could save them. The decisive battle was fought near Trifanum (between Minturnae, Suessa, and Sinuessa) in 414; the consul Titus Manlius Imperiosus Torquatus achieved a complete victory over the united Latins and Campanians. In the two following years the individual towns, so far as they still offered resistance, were reduced by capitulation or assault, and the whole country was brought into subjection. The effect of the victory was the dissolution of the Latin league. It was transformed from an independent political federation into a mere association for the purpose of a religious festival; the ancient stipulated rights of the confederacy as to a maximum for the levy of troops and a share of the gains of war perished as such along with it, and assumed, where they were recognized in future, the character of acts of grace. Instead of the one treaty between Rome on the one hand and the Latin confederacy on the other, there came at best perpetual alliances between Rome and the several confederate towns. To this footing of treaty there were admitted of the old-Latin places, besides Laurentum, also Tibur and Praeneste, which however were compelled to cede portions of their territory to Rome. Like terms were obtained by the communities of Latin rights founded outside of Latium, so far as they had not taken part in the war. The principle of isolating the communities from each other, which had already been established in regard to the places founded after 370,(21) was thus extended to the whole

Page 321

Latin nation. In other respects the several places retained their former privileges and their autonomy. The other old-Latin communities as well as the colonies that had revolted lost—all of them—independence and entered in one form or another into the Roman burgess-union. The two important coast towns Antium (416) and Tarracina (425) were, after the model of Ostia, occupied with Roman full-burgesses and restricted to a communal independence confined within narrow limits, while the previous burgesses were deprived in great part of their landed property in favour of the Roman colonists and, so far as they retained it, likewise adopted into the full burgess-union. Lanuvium, Aricia, Momentum, Pedum became Roman burgess-communities after the model of Tusculum.(22) The walls of Velitrae were demolished, its senate was ejected -en masse- and deported to the interior of Roman Etruria, and the town was probably constituted a dependent community with Caerite rights.(23) Of the land acquired a portion—the estates, for instance, of the senators of Velitrae—was distributed to Roman burgesses: with these special assignments was connected the erection of two new tribes in 422. The deep sense which prevailed in Rome of the enormous importance of the result achieved is attested by the honorary column, which was erected in the Roman Forum to the victorious dictator of 416, Gaius Maenius, and by the decoration of the orators' platform in the same place with the beaks taken from the galleys of Antium that were found unserviceable.

Complete Submission of the Volscian and Campanian Provinces

In like manner the dominion of Rome was established and confirmed in the south Volscian and Campanian territories. Fundi, Formiae, Capua, Cumae, and a number of smaller towns became dependent Roman communities with self-administration. To secure the pre-eminently important city of Capua, the breach between the nobility and commons was artfully widened, the communal constitution was revised in the Roman interest, and the administration of the town was controlled by Roman officials annually sent to Campania. The same treatment was measured out some years after to the Volscian Privernum, whose citizens, supported by Vitruvius Vaccus a bold partisan belonging to Fundi, had the honour of fighting the last battle for the freedom of this region; the struggle ended with the storming of the town (425) and the execution of Vaccus in a Roman prison. In order to rear a population devoted to Rome in these regions, they distributed, out of the lands won in war particularly in the Privernate and Falernian territories, so numerous allotments to Roman burgesses, that a few years later (436) they were able to institute there also two new tribes. The establishment of two fortresses as colonies with Latin rights finally secured the newly won land. These were Cales (420) in the middle of the Campanian plain, whence the movements of Teanum and Capua could be observed, and Fregellae (426), which

Page 322

commanded the passage of the Liris. Both colonies were unusually strong, and rapidly became flourishing, notwithstanding the obstacles which the Sidicines interposed to the founding of Cales and the Samnites to that of Fregellae. A Roman garrison was also despatched to Sora, a step of which the Samnites, to whom this district had been left by the treaty, complained with reason, but in vain. Rome pursued her purpose with undeviating steadfastness, and displayed her energetic and far-reaching policy—more even than on the battlefield—in the securing of the territory which she gained by enveloping it, politically and militarily, in a net whose meshes could not be broken.

Inaction of the Samnites

As a matter of course, the Samnites could not behold the threatening progress of the Romans with satisfaction, and they probably put obstacles in its way; nevertheless they neglected to intercept the new career of conquest, while there was still perhaps time to do so, with that energy which the circumstances required. They appear indeed in accordance with their treaty with Rome to have occupied and strongly garrisoned Teanum; for while in earlier times that city sought help against Samnium from Capua and Rome, in the later struggles it appears as the bulwark of the Samnite power on the west. They spread, conquering and destroying, on the upper Liris, but they neglected to establish themselves permanently in that quarter. They destroyed the Volscian town Fregellae—by which they simply facilitated the institution of the Roman colony there which we have just mentioned—and they so terrified two other Volscian towns, Fabrateria (Ceccano) and Luca (site unknown), that these, following the example of Capua, surrendered themselves to the Romans (424). The Samnite confederacy allowed the Roman conquest of Campania to be completed before they in earnest opposed it; and the reason for their doing so is to be sought partly in the contemporary hostilities between the Samnite nation and the Italian Hellenes, but principally in the remiss and distracted policy which the confederacy pursued.

Notes for Book II Chapter V

1. I. VII. Relation of Rome to Latium
2. The original equality of the two armies is evident from Liv. i. 52; viii. 8, 14, and Dionys. viii, 15; but most clearly from Polyb. vi. 26.
3. Dionysius (viii. 15) expressly states, that in the later federal treaties between Rome and Latium the Latin communities were interdicted from calling out their contingents of their own motion and sending them into the field alone.

Page 323

4. These Latin staff-officers were the twelve -*praefecti sociorum*-, who subsequently, when the old phalanx had been resolved into the later legions and -*alae*-, had the charge of the two -*alae*- of the federal contingents, six to each -*ala*-, just as the twelve war-tribunes of the Roman army had charge of the two legions, six to each legion. Polybius (vi. 26, 5) states that the consul nominated the former, as he originally nominated the latter. Now, as according to the ancient maxim of law, that every person under obligation of service might become an officer (p. 106), it was legally allowable for the general to appoint a Latin as leader of a Roman, as well as conversely a Roman as leader of a Latin, legion, this led to the practical result that the -*tribuni militum*- were wholly, and the -*praefecti sociorum*- at least ordinarily, Romans.

5. These were the -*decuriones turmarum*- and -*praefecti cohortium*- (Polyb. vi. 21, 5; Liv. xxv. 14; Sallust. Jug. 69, *et al.*) Of course, as the Roman consuls were in law and ordinarily also in fact commanders-in-chief, the presidents of the community in the dependent towns also were perhaps throughout, or at least very frequently, placed at the head of the community-contingents (Liv. xxiii. 19; Orelli, Inscr. 7022). Indeed, the usual name given to the Latin magistrates (-*praetores*-) indicates that they were officers.

6. Such a —*metoikos*— was not like an actual burgess assigned to a specific voting district once for all, but before each particular vote the district in which the —*metoeci*— were upon that occasion to vote was fixed by lot. In reality this probably amounted to the concession to the Latins of one vote in the Roman -*comitia tributa*-. As a place in some tribe was a preliminary condition of the ordinary centuriate suffrage, if the —*metoeci*— shared in the voting in the assembly of the centuries—which we do not know—a similar allotment must have been fixed for the latter. In the curies they must have taken part like the plebeians.

7. II. I. Abolition of the Life-Presidency of the Community

8. Ordinarily, as is well known, the Latin communities were presided over by two praetors. Besides these there occur in several communities single magistrates, who in that case bear the title of dictator; as in Alba (Orelli-Henzen, Inscr. 2293), Tusculum (p. 445, note 2), Lanuvium (Cicero, pro Mil. 10, 27; 17, 45; Asconius, in Mil. p. 32, Orell.; Orelli, n. 2786, 5157, 6086); Compitum (Orelli, 3324); Nomentum (Orelli, 208, 6138, 7032; comp. Henzen, Bullett. 1858, p. 169); and Aricia (Orelli, n. 1455). To these falls to be added the similar dictator in the -*civitas sine suffragio*- of Caere (Orelli, n. 3787, 5772; also Garrucci Diss. arch., i. p. 31, although erroneously placed after Sutrium); and further the officials of the like name at Fidenae (Orelli, 112). All these magistracies or priesthoods that originated in magistracies (the dictator of Caere is to be explained

Page 324

in accordance with Liv. ix. 43: -Anagninis—magistratibus praeter quam sacrorum curatione interdictum-), were annual (Orelli, 208). The statement of Macer likewise and of the annalists who borrowed from him, that Alba was at the time of its fall no longer under kings, but under annual directors (Dionys. v. 74; Plutarch, Romul. 27; Liv. i. 23), is presumably a mere inference from the institution, with which he was acquainted, of the sacerdotal Alban dictatorship which was beyond doubt annual like that of Nomentum; a view in which, moreover, the democratic partisanship of its author may have come into play. It may be a question whether the inference is valid, and whether, even if Alba at the time of its dissolution was under rulers holding office for life, the abolition of monarchy in Rome might not subsequently lead to the conversion of the Alban dictatorship into an annual office.

All these Latin magistracies substantially coincide in reality, as well as specially in name, with the arrangement established in Rome by the revolution in a way which is not adequately explained by the mere similarity of the political circumstances underlying them.

9. II. IV. Etruscans Driven Back from Latium

10. The country of the Aequi embraces not merely the valley of the Anio above Tibur and the territory of the later Latin colonies Carsioli (on the upper part of the Turano) and Alba (on the Fucine lake), but also the district of the later municipium of the Aequiculi, who are nothing but that remnant of the Aequi to which, after the subjugation by the Romans, and after the assignation of the largest portion of the territory to Roman or Latin colonists, municipal independence was left.

11. To all appearance Velitrae, although situated in the plain, was originally Volscian, and so a Latin colony; Cora, on the other hand, on the Volscian mountains, was originally Latin.

12. Not long afterwards must have taken place the founding of the -Nemus Dianae- in the forest of Aricia, which, according to Cato's account (p. 12, Jordan), a Tusculan dictator accomplished for the urban communities of old Latium, Tusculum, Aricia, Lanuvium, Laurentum, Cora, and Tibur, and of the two Latin colonies (which therefore stand last) Suessa Pometia and Ardea (-populus Ardeatis Rutulus-). The absence of Praeneste and of the smaller communities of the old Latium shows, as was implied in the nature of the case, that not all the communities of the Latin league at that time took part in the consecration. That it falls before 372 is proved by the emergence of Pometia (*ii. V. Closing Of The Latin Confederation*), and the list quite accords with what can otherwise be ascertained as to the state of the league shortly after the accession of Ardea.

More credit may be given to the traditional statements regarding the years of the foundations than to most of the oldest traditions, seeing that the numbering of the year -ab urbe condita-, common to the Italian cities, has to all appearance preserved, by direct tradition, the year in which the colonies were founded.

Page 325

13. The two do not appear as Latin colonies in the so-called Cassian list about 372, but they so appear in the Carthaginian treaty of 406; the towns had thus become Latin colonies in the interval.

14. In the list given by Dionysius (v. 61) of the thirty Latin federal cities—the only list which we possess—there are named the Ardeates, Aricini, Bovillani, Bubentani (site unknown), Corni (rather Corani), Carventani (site unknown), Circeienses, Coriolani, Corbintes, Cabani (perhaps the Cabenses on the Alban Mount, Bull, *dell' Inst.* 1861, p. 205), Fortinei (unknown), Gabini, Laurentes, Lanuvini, Lavinates, Labicani, Nomentani, Norbani, Praenestini, Pedani, Querquetulani (site unknown), Satricani, Scaptini, Setini, Tiburtini, Tusculani, Tellenii (site unknown), Tolerini (site unknown), and Veliterni. The occasional notices of communities entitled to participate, such as of Ardea (Liv. xxxii. x), Laurentum (Liv. xxxvii. 3), Lanuvium (Liv. xli. 16), Bovillae, Gabii, Labici (Cicero, *pro Plane.* 9, 23) agree with this list. Dionysius gives it on occasion of the declaration of war by Latium against Rome in 256, and it was natural therefore to regard—as Niebuhr did—this list as derived from the well-known renewal of the league in 261. But, as in this list drawn up according to the Latin alphabet the letter -g appears in a position which it certainly had not at the time of the Twelve Tables and scarcely came to occupy before the fifth century (see my *Unteritalische Dial.* p. 33), it must be taken from a much more recent source; and it is by far the simplest hypothesis to recognize it as a list of those places which were afterwards regarded as the ordinary members of the Latin confederacy, and which Dionysius in accordance with his systematizing custom specifies as its original component elements. As was to be expected, the list presents not a single non-Latin community; it simply enumerates places originally Latin or occupied by Latin colonies—no one will lay stress on Corbio and Corioli as exceptions. Now if we compare with this list that of the Latin colonies, there had been founded down to 372 Suessa Pometia, Velitrae, Norba, Signia, Ardea, Circeii (361), Satricum (369), Sutrium (371), Nepete (371), Setia (372). Of the last three founded at nearly the same time the two Etruscan ones may very well date somewhat later than Setia, since in fact the foundation of every town claimed a certain amount of time, and our list cannot be free from minor inaccuracies. If we assume this, then the list contains all the colonies sent out up to the year 372, including the two soon afterwards deleted from the list, Satricum destroyed in 377 and Velitrae divested of Latin rights in 416; there are wanting only Suessa Pometia, beyond doubt as having been destroyed before 372, and Signia, probably because in the text of Dionysius, who mentions only twenty-nine names, —SIGNINON— has dropped out after —SEITINON—. In entire harmony with this view there are absent from this list all the Latin colonies founded after 372 as well as all places, which like Ostia, Antemnae, Alba, were incorporated with the Roman community before the year 370, whereas those incorporated subsequently, such as Tusculum, Lanuvium, Velitrae, are retained in it.

Page 326

As regards the list given by Pliny of thirty-two townships extinct in his time which had formerly participated in the Alban festival, after deduction of seven that also occur in Dionysius (for the Cusuetani of Pliny appear to be the Carventani of Dionysius), there remain twenty-five townships, most of them quite unknown, doubtless made up partly of those seventeen non-voting communities—most of which perhaps were just the oldest subsequently disqualified members of the Alban festal league—partly of a number of other decayed or ejected members of the league, to which latter class above all the ancient presiding township of Alba, also named by Pliny, belonged.

15. Livy certainly states (iv. 47) that Labici became a colony in 336. But—apart from the fact that Diodorus (xiii. 6) says nothing of it—Labici cannot have been a burgess-colony, for the town did not lie on the coast and besides it appears subsequently as still in possession of autonomy; nor can it have been a Latin one, for there is not, nor can there be from the nature of these foundations, a single other example of a Latin colony established in the original Latium. Here as elsewhere it is most probable—especially as two -jugera- are named as the portion of land allotted—that a public assignation to the burgesses has been confounded with a colonial assignation (I. XIII. System of Joint Cultivation).

16. II. IV. South Etruria Roman

17. II. V. League with the Hernici

18. This restriction of the ancient full reciprocity of Latin rights first occurs in the renewal of the treaty in 416 (Liv. viii. 14); but as the system of isolation, of which it was an essential part, first began in reference to the Latin colonies settled after 370, and was only generalized in 416, it is proper to mention this alteration here.

19. The name itself is very ancient; in fact it is the most ancient indigenous name for the inhabitants of the present Calabria (Antiochus, Fr. 5. Mull.). The well-known derivation is doubtless an invention.

20. Perhaps no section of the Roman annals has been more disfigured than the narrative of the first Samnite-Latin war, as it stands or stood in Livy, Dionysius, and Appian. It runs somewhat to the following effect. After both consuls had marched into Campania in 411, first the consul Marcus Valerius Corvus gained a severe and bloody victory over the Samnites at Mount Gaurus; then his colleague Aulus Cornelius Cossus gained another, after he had been rescued from annihilation in a narrow pass by the self-devotion of a division led by the military tribune Publius Decius. The third and decisive battle was fought by both consuls at the entrance of the Caudine Pass near Suessula; the Samnites were completely vanquished—forty thousand of their shields were picked up on the field of battle—and they were compelled to make a peace, in which the Romans retained Capua, which had given itself over to their possession, while they

Page 327

left Teanum to the Samnites (413). Congratulations came from all sides, even from Carthage. The Latins, who had refused their contingent and seemed to be arming against Rome, turned their arms not against Rome but against the Paeligni, while the Romans were occupied first with a military conspiracy of the garrison left behind in Campania (412), then with the capture of Privernum (413) and the war against the Antiates. But now a sudden and singular change occurred in the position of parties. The Latins, who had demanded in vain Roman citizenship and a share in the consulate, rose against Rome in conjunction with the Sidicines, who had vainly offered to submit to the Romans and knew not how to save themselves from the Samnites, and with the Campanians, who were already tired of the Roman rule. Only the Laurentes in Latium and the -equites- of Campania adhered to the Romans, who on their part found support among the Paeligni and Samnites. The Latin army fell upon Samnium; the Romano-Samnite army, after it had marched to the Fucine lake and from thence, avoiding Latium, into Campania, fought the decisive battle against the combined Latins and Campanians at Vesuvius; the consul Titus Manlius Imperiosus, after he had himself restored the wavering discipline of the army by the execution of his own son who had slain a foe in opposition to orders from headquarters, and after his colleague Publius Decius Mus had appeased the gods by sacrificing his life, at length gained the victory by calling up the last reserves. But the war was only terminated by a second battle, in which the consul Manlius engaged the Latins and Campanians near Trifanum; Latium and Capua submitted, and were mulcted in a portion of their territory.

The judicious and candid reader will not fail to observe that this report swarms with all sorts of impossibilities. Such are the statement of the Antiates waging war after the surrender of 377 (Liv. vi. 33); the independent campaign of the Latins against the Paeligni, in distinct contradiction to the stipulations of the treaties between Rome and Latium; the unprecedented march of the Roman army through the Marsian and Samnite territory to Capua, while all Latium was in arms against Rome; to say nothing of the equally confused and sentimental account of the military insurrection of 412, and the story of its forced leader, the lame Titus Quinctius, the Roman Gotz von Berlichingen. Still more suspicious perhaps, are the repetitions. Such is the story of the military tribune Publius Decius modelled on the courageous deed of Marcus Calpurnius Flamma, or whatever he was called, in the first Punic war; such is the recurrence of the conquest of Privernum by Gaius Plautius in the year 425, which second conquest alone is registered in the triumphal Fasti; such is the self-immolation of Publius Decius, repeated, as is well known, in the case of his son in 459. Throughout this section the whole representation betrays a different period and a different hand from the other

Page 328

more credible accounts of the annals. The narrative is full of detailed pictures of battles; of inwoven anecdotes, such as that of the praetor of Setia, who breaks his neck on the steps of the senate-house because he had been audacious enough to solicit the consulship, and the various anecdotes concocted out of the surname of Titus Manlius; and of prolix and in part suspicious archaeological digressions. In this class we include the history of the legion—of which the notice, most probably apocryphal, in Liv. i. 52, regarding the maniples of Romans and Latins intermingled formed by the second Tarquin, is evidently a second fragment, the erroneous view given of the treaty between Capua and Rome (see my Rom. Munzwesen, p. 334, n. 122); the formularies of self-devotion, the Campanian -denarius-, the Laurentine alliance, and the -bina jugera- in the assignation (p. 450, note). Under such circumstances it appears a fact of great weight that Diodorus, who follows other and often older accounts, knows absolutely nothing of any of these events except the last battle at Trifanum; a battle in fact that ill accords with the rest of the narrative, which, in accordance with the rules of poetical justice, ought to have concluded with the death of Decius.

22. II. V. Crises within the Romano-Latin League

23. II. IV. South Etruria Roman

CHAPTER VI

Struggle of the Italians against Rome

Wars between the Sabellians and Tarentines—

Archidamus—

Alexander the Molossian—

While the Romans were fighting on the Liris and Volturnus, other conflicts agitated the south-east of the peninsula. The wealthy merchant-republic of Tarentum, daily exposed to more serious peril from the Lucanian and Messapian bands and justly distrusting its own sword, gained by good words and better coin the help of -condottieri-from the mother-country. The Spartan king, Archidamus, who with a strong band had come to the assistance of his fellow-Dorians, succumbed to the Lucanians on the same day on which Philip conquered at Chaeronea (416); a retribution, in the belief of the pious Greeks, for the share which nineteen years previously he and his people had taken in pillaging the sanctuary of Delphi. His place was taken by an abler commander, Alexander the Molossian, brother of Olympias the mother of Alexander the Great. In addition to the troops which he had brought along with him he united under his banner

the contingents of the Greek cities, especially those of the Tarentines and Metapontines; the Poediculi (around Rubi, now Ruvo), who like the Greeks found themselves in danger from the Sabellian nation; and lastly, even the Lucanian exiles themselves, whose considerable numbers point to the existence of violent internal troubles in that confederacy. Thus he

Page 329

soon found himself superior to the enemy. Consentia (Cosenza), which seems to have been the federal headquarters of the Sabellians settled in Magna Graecia, fell into his hands. In vain the Samnites came to the help of the Lucanians; Alexander defeated their combined forces near Paestum. He subdued the Daunians around Sipontum, and the Messapians in the south-eastern peninsula; he already commanded from sea to sea, and was on the point of arranging with the Romans a joint attack on the Samnites in their native abodes. But successes so unexpected went beyond the desires of the Tarentine merchants, and filled them with alarm. War broke out between them and their captain, who had come amongst them a hired mercenary and now appeared desirous to found a Hellenic empire in the west like his nephew in the east. Alexander had at first the advantage; he wrested Heraclea from the Tarentines, restored Thurii, and seems to have called upon the other Italian Greeks to unite under his protection against the Tarentines, while he at the same time tried to bring about a peace between them and the Sabellian tribes. But his grand projects found only feeble support among the degenerate and desponding Greeks, and the forced change of sides alienated from him his former Lucanian adherents: he fell at Pandosia by the hand of a Lucanian emigrant (422).(1) On his death matters substantially reverted to their old position. The Greek cities found themselves once more isolated and once more left to protect themselves as best they might by treaty or payment of tribute, or even by extraneous aid; Croton for instance repulsed the Bruttii about 430 with the help of the Syracusans. The Samnite tribes acquire renewed ascendancy, and were able, without troubling themselves about the Greeks, once more to direct their eyes towards Campania and Latium.

But there during the brief interval a prodigious change had occurred. The Latin confederacy was broken and scattered, the last resistance of the Volsci was overcome, the province of Campania, the richest and finest in the peninsula, was in the undisputed and well-secured possession of the Romans, and the second city of Italy was a dependency of Rome. While the Greeks and Samnites were contending with each other, Rome had almost without a contest raised herself to a position of power which no single people in the peninsula possessed the means of shaking, and which threatened to render all of them subject to her yoke. A joint exertion on the part of the peoples who were not severally a match for Rome might perhaps still burst the chains, ere they became fastened completely. But the clearness of perception, the courage, the self-sacrifice required for such a coalition of numerous peoples and cities that had hitherto been for the most part foes or at any rate strangers to each other, were not to be found at all, or were found only when it was already too late.

Coalition of the Italians against Rome

Page 330

After the fall of the Etruscan power and the weakening of the Greek republics, the Samnite confederacy was beyond doubt, next to Rome, the most considerable power in Italy, and at the same time that which was most closely and immediately endangered by Roman encroachments. To its lot therefore fell the foremost place and the heaviest burden in the struggle for freedom and nationality which the Italians had to wage against Rome. It might reckon upon the assistance of the small Sabellian tribes, the Vestini, Frentani, Marrucini, and other smaller cantons, who dwelt in rustic seclusion amidst their mountains, but were not deaf to the appeal of a kindred stock calling them to take up arms in defence of their common possessions. The assistance of the Campanian Greeks and those of Magna Graecia (especially the Tarentines), and of the powerful Lucanians and Bruttians would have been of greater importance; but the negligence and supineness of the demagogues ruling in Tarentum and the entanglement of that city in the affairs of Sicily, the internal distractions of the Lucanian confederacy, and above all the deep hostility that had subsisted for centuries between the Greeks of Lower Italy and their Lucanian oppressors, scarcely permitted the hope that Tarentum and Lucania would make common cause with the Samnites. From the Sabines and the Marsi, who were the nearest neighbours of the Romans and had long lived in peaceful relations with Rome, little more could be expected than lukewarm sympathy or neutrality. The Apulians, the ancient and bitter antagonists of the Sabellians, were the natural allies of the Romans. On the other hand it might be expected that the more remote Etruscans would join the league if a first success were gained; and even a revolt in Latium and the land of the Volsci and Hernici was not impossible. But the Samnites—the Aetolians of Italy, in whom national vigour still lived unimpaired—had mainly to rely on their own energies for such perseverance in the unequal struggle as would give the other peoples time for a generous sense of shame, for calm deliberation, and for the mustering of their forces; a single success might then kindle the flames of war and insurrection all around Rome. History cannot but do the noble people the justice of acknowledging that they understood and performed their duty.

Outbreak of War between Samnium and Rome— Pacification of Campania

Differences had already for several years existed between Rome and Samnium in consequence of the continual aggressions in which the Romans indulged on the Liris, and of which the founding of Fregellae in 426 was the latest and most important. But it was the Greeks of Campania that gave occasion to the outbreak of the contest. After Cumae and Capua had become Roman, nothing so naturally suggested itself to the Romans as the subjugation of the Greek city Neapolis, which ruled also over the Greek islands in the bay—the only town not yet reduced to subjection within the

Page 331

field of the Roman power. The Tarentines and Samnites, informed of the scheme of the Romans to obtain possession of the town, resolved to anticipate them; and while the Tarentines were too remiss perhaps rather than too distant for the execution of this plan, the Samnites actually threw into it a strong garrison. The Romans immediately declared war nominally against the Neapolitans, really against the Samnites (427), and began the siege of Neapolis. After it had lasted a while, the Campanian Greeks became weary of the disturbance of their commerce and of the foreign garrison; and the Romans, whose whole efforts were directed to keep states of the second and third rank by means of separate treaties aloof from the coalition which was about to be formed, hastened, as soon as the Greeks consented to negotiate, to offer them the most favourable terms—full equality of rights and exemption from land service, equal alliance and perpetual peace. Upon these conditions, after the Neapolitans had rid themselves of the garrison by stratagem, a treaty was concluded (428).

The Sabellian towns to the south of the Volturnus, Nola, Nuceria, Herculaneum, and Pompeii, took part with Samnium in the beginning of the war; but their greatly exposed situation and the machinations of the Romans—who endeavoured to bring over to their side the optimate party in these towns by all the levers of artifice and self-interest, and found a powerful support to their endeavours in the precedent of Capua—induced these towns to declare themselves either in favour of Rome or neutral not long after the fall of Neapolis.

Alliance between the Romans and Lucanians

A still more important success befell the Romans in Lucania. There also the people with true instinct was in favour of joining the Samnites; but, as an alliance with the Samnites involved peace with Tarentum and a large portion of the governing lords of Lucania were not disposed to suspend their profitable pillaging expeditions, the Romans succeeded in concluding an alliance with Lucania—an alliance which was invaluable, because it provided employment for the Tarentines and thus left the whole power of Rome available against Samnium.

War in Samnium—

The Caudine Pass and the Caudine Peace

Thus Samnium stood on all sides unsupported; excepting that some of the eastern mountain districts sent their contingents. In the year 428 the war began within the Samnite land itself: some towns on the Campanian frontier, *Rufrae* (between *Venafrum* and *Teanum*) and *Allifae*, were occupied by the Romans. In the following years the Roman armies penetrated Samnium, fighting and pillaging, as far as the territory of the *Vestini*, and even as far as *Apulia*, where they were received with open arms; everywhere they had very decidedly the advantage. The courage of the Samnites was

broken; they sent back the Roman prisoners, and along with them the dead body of the leader of the war party, Brutulus Papius, who had

Page 332

anticipated the Roman executioners, when the Samnite national assembly determined to ask the enemy for peace and to procure for themselves more tolerable terms by the surrender of their bravest general. But when the humble, almost suppliant, request was not listened to by the Roman people (432), the Samnites, under their new general Gavius Pontius, prepared for the utmost and most desperate resistance. The Roman army, which under the two consuls of the following year (433) Spurius Postumius and Titus Veturius was encamped near Calatia (between Caserta and Maddaloni), received accounts, confirmed by the affirmation of numerous captives, that the Samnites had closely invested Luceria, and that that important town, on which depended the possession of Apulia, was in great danger. They broke up in haste. If they wished to arrive in good time, no other route could be taken than through the midst of the enemy's territory—where afterwards, in continuation of the Appian Way, the Roman road was constructed from Capua by way of Beneventum to Apulia. This route led, between the present villages of Arpaja and Montesarchio (Caudium), through a watery meadow, which was wholly enclosed by high and steep wooded hills and was only accessible through deep defiles at the entrance and outlet. Here the Samnites had posted themselves in ambush. The Romans, who had entered the valley unopposed, found its outlet obstructed by abattis and strongly occupied; on marching back they saw that the entrance was similarly closed, while at the same time the crests of the surrounding mountains were crowned by Samnite cohorts. They perceived, when it was too late, that they had suffered themselves to be misled by a stratagem, and that the Samnites awaited them, not at Luceria, but in the fatal pass of Caudium. They fought, but without hope of success and without earnest aim; the Roman army was totally unable to manoeuvre and was completely vanquished without a struggle. The Roman generals offered to capitulate. It is only a foolish rhetoric that represents the Samnite general as shut up to the simple alternatives of disbanding or of slaughtering the Roman army; he could not have done better than accept the offered capitulation and make prisoners of the hostile army—the whole force which for the moment the Roman community could bring into action—with both its commanders-in-chief. In that case the way to Campania and Latium would have stood open; and in the then existing state of feeling, when the Volsci and Hernici and the larger portion of the Latins would have received him with open arms, the political existence of Rome would have been in serious danger. But instead of taking this course and concluding a military convention, Gavius Pontius thought that he could at once terminate the whole quarrel by an equitable peace; whether it was that he shared that foolish longing of the confederates for peace, to which Brutulus Papius had fallen a victim in the previous year, or whether it was that he was

Page 333

unable to prevent the party which was tired of the war from spoiling his unexampled victory. The terms laid down were moderate enough; Rome was to raze the fortresses which she had constructed in defiance of the treaty—Cales and Fregellae—and to renew her equal alliance with Samnium. After the Roman generals had agreed to these terms and had given six hundred hostages chosen from the cavalry for their faithful execution—besides pledging their own word and that of all their staff-officers on oath to the same effect—the Roman army was dismissed uninjured, but disgraced; for the Samnite army, drunk with victory, could not resist the desire to subject their hated enemies to the disgraceful formality of laying down their arms and passing under the yoke.

But the Roman senate, regardless of the oath of their officers and of the fate of the hostages, cancelled the agreement, and contented themselves with surrendering to the enemy those who had concluded it as personally responsible for its fulfilment. Impartial history can attach little importance to the question whether in so doing the casuistry of Roman advocates and priests kept the letter of the law, or whether the decree of the Roman senate violated it; under a human and political point of view no blame in this matter rests upon the Romans. It was a question of comparative indifference whether, according to the formal state law of the Romans, the general in command was or was not entitled to conclude peace without reserving its ratification by the burgesses. According to the spirit and practice of the constitution it was quite an established principle that in Rome every state-agreement, not purely military, pertained to the province of the civil authorities, and a general who concluded peace without the instructions of the senate and the burgesses exceeded his powers. It was a greater error on the part of the Samnite general to give the Roman generals the choice between saving their army and exceeding their powers, than it was on the part of the latter that they had not the magnanimity absolutely to repel such a suggestion; and it was right and necessary that the Roman senate should reject such an agreement. A great nation does not surrender what it possesses except under the pressure of extreme necessity: all treaties making concessions are acknowledgments of such a necessity, not moral obligations. If every people justly reckons it a point of honour to tear to pieces by force of arms treaties that are disgraceful, how could honour enjoin a patient adherence to a convention like the Caudine to which an unfortunate general was morally compelled, while the sting of the recent disgrace was keenly felt and the vigour of the nation subsisted unimpaired?

Victory of the Romans

Page 334

Thus the convention of Caudium did not produce the rest which the enthusiasts for peace in Samnium had foolishly expected from it, but only led to war after war with exasperation aggravated on either side by the opportunity forfeited, by the breach of a solemn engagement, by military honour disgraced, and by comrades that had been abandoned. The Roman officers given up were not received by the Samnites, partly because they were too magnanimous to wreak their vengeance on those unfortunates, partly because they would thereby have admitted the Roman plea that the agreement bound only those who swore to it, not the Roman state. Magnanimously they spared even the hostages whose lives had been forfeited by the rules of war, and preferred to resort at once to arms.

Luceria was occupied by them and Fregellae surprised and taken by assault (434) before the Romans had reorganized their broken army; the passing of the Satricans(2) over to the Samnites shows what they might have accomplished, had they not allowed their advantage to slip through their hands. But Rome was only momentarily paralyzed, not weakened; full of shame and indignation the Romans raised all the men and means they could, and placed the highly experienced Lucius Papirius Cursor, equally distinguished as a soldier and as a general, at the head of the newly formed army. The army divided; the one-half marched by Sabina and the Adriatic coast to appear before Luceria, the other proceeded to the same destination through Samnium itself, successfully engaging and driving before it the Samnite army. They formed a junction again under the walls of Luceria, the siege of which was prosecuted with the greater zeal, because the Roman equites lay in captivity there; the Apulians, particularly the Arpani, lent the Romans important assistance in the siege, especially by procuring supplies. After the Samnites had given battle for the relief of the town and been defeated, Luceria surrendered to the Romans (435). Papirius enjoyed the double satisfaction of liberating his comrades who had been given up for lost, and of requiting the yoke of Caudium on the Samnite garrison of Luceria. In the next years (435-437) the war was carried on(3) not so much in Samnium itself as in the adjoining districts. In the first place the Romans chastised the allies of the Samnites in the Apulian and Frentanian territories, and concluded new conventions with the Teanenses of Apulia and the Canusini. At the same time Satricum was again reduced to subjection and severely punished for its revolt. Then the war turned to Campania, where the Romans conquered the frontier town towards Samnium, Saticula (perhaps S. Agata de' Goti) (438). But now the fortune of war seemed disposed once more to turn against them. The Samnites gained over the Nucernians (438), and soon afterwards the Nolans, to their side; on the upper Liris the Sorani of themselves expelled the Roman garrison (439); the Ausonians were preparing

Page 335

to rise, and threatened the important Cales; even in Capua the party opposed to Rome was vigorously stirring. A Samnite army advanced into Campania and encamped before the city, in the hope that its vicinity might place the national party in the ascendant (440). But Sora was immediately attacked by the Romans and recaptured after the defeat of a Samnite relieving force (440). The movements among the Ausonians were suppressed with cruel rigour ere the insurrection fairly broke out, and at the same time a special dictator was nominated to institute and decide political processes against the leaders of the Samnite party in Capua, so that the most illustrious of them died a voluntary death to escape from the Roman executioner (440). The Samnite army before Capua was defeated and compelled to retreat from Campania; the Romans, following close at the heels of the enemy, crossed the Matese and encamped in the winter of 440 before Bovianum, the capital of Samnium. Nola was abandoned by its allies; and the Romans had the sagacity to detach the town for ever from the Samnite party by a very favourable convention, similar to that concluded with Neapolis (441). Fregellae, which after the catastrophe of Caudium had fallen into the hands of the party adverse to Rome and had been their chief stronghold in the district on the Liris, finally fell in the eighth year after its occupation by the Samnites (441); two hundred of the citizens, the chief members of the national party, were conveyed to Rome, and there openly beheaded in the Forum as an example and a warning to the patriots who were everywhere bestirring themselves.

New Fortresses in Apulia and Campania

Apulia and Campania were thus in the hands of the Romans. In order finally to secure and permanently to command the conquered territory, several new fortresses were founded in it during the years 440-442: Luceria in Apulia, to which on account of its isolated and exposed situation half a legion was sent as a permanent garrison; Pontiae (the Ponza islands) for the securing of the Campanian waters; Saticula on the Campano-Samnite frontier, as a bulwark against Samnium; and lastly Interamna (near Monte Cassino) and Suessa Aurunca (Sessa) on the road from Rome to Capua. Garrisons moreover were sent to Caiatia (Cajazzo), Sora, and other stations of military importance. The great military road from Rome to Capua, which with the necessary embankment for it across the Pomptine marshes the censor Appius Claudius caused to be constructed in 442, completed the securing of Campania. The designs of the Romans were more and more fully developed; their object was the subjugation of Italy, which was enveloped more closely from year to year in a network of Roman fortresses and roads. The Samnites were already on both sides surrounded by the Roman meshes; already the line from Rome to Luceria severed north and south Italy from each other, as the fortresses of Norba and Signia had formerly severed the Volsci and Aequi; and Rome now rested on the Arpani, as it formerly rested on the Hernici. The Italians could not but see that the freedom of all of them was gone if Samnium succumbed, and that it was high time at length to hasten with all their might to the help of the brave

mountain people which had now for fifteen years singly sustained the unequal struggle with the Romans.

Page 336

Intervention of the Tarentines

The most natural allies of the Samnites would have been the Tarentines; but it was part of that fatality that hung over Samnium and over Italy in general, that at this moment so fraught with the destinies of the future the decision lay in the hands of these Athenians of Italy. Since the constitution of Tarentum, which was originally after the old Doric fashion strictly aristocratic, had become changed to a complete democracy, a life of singular activity had sprung up in that city, which was inhabited chiefly by mariners, fishermen, and artisans. The sentiments and conduct of the population, more wealthy than noble, discarded all earnestness amidst the giddy bustle and witty brilliance of their daily life, and oscillated between the grandest boldness of enterprise and elevation of spirit on the one hand, and a shameful frivolity and childish whim on the other. It may not be out of place, in connection with a crisis wherein the existence or destruction of nations of noble gifts and ancient renown was at stake, to mention that Plato, who came to Tarentum some sixty years before this time, according to his own statement saw the whole city drunk at the Dionysia, and that the burlesque farce, or “merry tragedy” as it was called, was created in Tarentum about the very time of the great Samnite war. This licentious life and buffoon poetry of the Tarentine fashionables and literati had a fitting counterpart in the inconstant, arrogant, and short-sighted policy of the Tarentine demagogues, who regularly meddled in matters with which they had nothing to do, and kept aloof where their immediate interests called for action. After the Caudine catastrophe, when the Romans and Samnites stood opposed in Apulia, they had sent envoys thither to enjoin both parties to lay down their arms (434). This diplomatic intervention in the decisive struggle of the Italians could not rationally have any other meaning than that of an announcement that Tarentum had at length resolved to abandon the neutrality which it had hitherto maintained. It had in fact sufficient reason to do so. It was no doubt a difficult and dangerous thing for Tarentum to be entangled in such a war; for the democratic development of the state had directed its energies entirely to the fleet, and while that fleet, resting upon the strong commercial marine of Tarentum, held the first rank among the maritime powers of Magna Graecia, the land force, on which they were in the present case dependent, consisted mainly of hired soldiers and was sadly disorganized. Under these circumstances it was no light undertaking for the Tarentine republic to take part in the conflict between Rome and Samnium, even apart from the—at least troublesome—feud in which Roman policy had contrived to involve them with the Lucanians. But these obstacles might be surmounted by an energetic will; and both the contending parties construed the summons of the Tarentine envoys that they should desist

Page 337

from the strife as meant in earnest. The Samnites, as the weaker, showed themselves ready to comply with it; the Romans replied by hoisting the signal for battle. Reason and honour dictated to the Tarentines the propriety of now following up the haughty injunction of their envoys by a declaration of war against Rome; but in Tarentum neither reason nor honour characterized the government, and they had simply been trifling in a very childish fashion with very serious matters. No declaration of war against Rome took place; in its stead they preferred to support the oligarchical party in the Sicilian towns against Agathocles of Syracuse who had at a former period been in the Tarentine service and had been dismissed in disgrace, and following the example of Sparta, they sent a fleet to the island—a fleet which would have rendered better service in the Campanian seas (440).

Accession of the Etruscans to the Coalition— Victory at the Vadimonian Lake

The peoples of northern and central Italy, who seem to have been roused especially by the establishment of the fortress of Luceria, acted with more energy. The Etruscans first drew the sword (443), the armistice of 403 having already expired some years before. The Roman frontier-fortress of Sutrium had to sustain a two years' siege, and in the vehement conflicts which took place under its walls the Romans as a rule were worsted, till the consul of the year 444 Quintus Fabius Rullianus, a leader who had gained experience in the Samnite wars, not only restored the ascendancy of the Roman arms in Roman Etruria, but boldly penetrated into the land of the Etruscans proper, which had hitherto from diversity of language and scanty means of communication remained almost unknown to the Romans. His march through the Ciminian Forest which no Roman army had yet traversed, and his pillaging of a rich region that had long been spared the horrors of war, raised all Etruria in arms. The Roman government, which had seriously disapproved the rash expedition and had when too late forbidden the daring leader from crossing the frontier, collected in the greatest haste new legions, in order to meet the expected onslaught of the whole Etruscan power. But a seasonable and decisive victory of Rullianus, the battle at the Vadimonian lake which long lived in the memory of the people, converted an imprudent enterprise into a celebrated feat of heroism and broke the resistance of the Etruscans. Unlike the Samnites who had now for eighteen years maintained the unequal struggle, three of the most powerful Etruscan towns—Perusia, Cortona, and Arretium—consented after the first defeat to a separate peace for three hundred months (444), and after the Romans had once more beaten the other Etruscans near Perusia in the following year, the Tarquinienses also agreed to a peace of four hundred months (446); whereupon the other cities desisted from the contest, and a temporary cessation of arms took place throughout Etruria.

Page 338

Last Campaigns in Samnium

While these events were passing, the war had not been suspended in Samnium. The campaign of 443 was confined like the preceding to the besieging and storming of several strongholds of the Samnites; but in the next year the war took a more vigorous turn. The dangerous position of Rullianus in Etruria, and the reports which spread as to the annihilation of the Roman army in the north, encouraged the Samnites to new exertions; the Roman consul Gaius Marcius Rutilus was vanquished by them and severely wounded in person. But the sudden change in the aspect of matters in Etruria destroyed their newly kindled hopes. Lucius Papirius Cursor again appeared at the head of the Roman troops sent against the Samnites, and again remained the victor in a great and decisive battle (445), in which the confederates had put forth their last energies. The flower of their army—the wearers of the striped tunics and golden shields, and the wearers of the white tunics and silver shields—were there extirpated, and their splendid equipments thenceforth on festal occasions decorated the rows of shops along the Roman Forum. Their distress was ever increasing; the struggle was becoming ever more hopeless. In the following year (446) the Etruscans laid down their arms; and in the same year the last town of Campania which still adhered to the Samnites, Nuceria, simultaneously assailed on the part of the Romans by water and by land, surrendered under favourable conditions. The Samnites found new allies in the Umbrians of northern, and in the Marsi and Paeligni of central, Italy, and numerous volunteers even from the Hernici joined their ranks; but movements which might have decidedly turned the scale against Rome, had the Etruscans still remained under arms, now simply augmented the results of the Roman victory without seriously adding to its difficulties. The Umbrians, who gave signs of marching on Rome, were intercepted by Rullianus with the army of Samnium on the upper Tiber—a step which the enfeebled Samnites were unable to prevent; and this sufficed to disperse the Umbrian levies. The war once more returned to central Italy. The Paeligni were conquered, as were also the Marsi; and, though the other Sabellian tribes remained nominally foes of Rome, in this quarter Samnium gradually came to stand practically alone. But unexpected assistance came to them from the district of the Tiber. The confederacy of the Hernici, called by the Romans to account for their countrymen found among the Samnite captives, now declared war against Rome (in 448)—more doubtless from despair than from calculation. Some of the more considerable Hernican communities from the first kept aloof from hostilities; but Anagnia, by far the most eminent of the Hernican cities, carried out this declaration of war. In a military point of view the position of the Romans was undoubtedly rendered for the moment highly critical by this unexpected

Page 339

rising in the rear of the army occupied with the siege of the strongholds of Samnium. Once more the fortune of war favoured the Samnites; Sora and Caiatia fell into their hands. But the Anagnines succumbed with unexpected rapidity before troops despatched from Rome, and these troops also gave seasonable relief to the army stationed in Samnium: all in fact was lost. The Samnites sued for peace, but in vain; they could not yet come to terms. The final decision was reserved for the campaign of 449. Two Roman consular armies penetrated—the one, under Tiberius Minucius and after his fall under Marcus Fulvius, from Campania through the mountain passes, the other, under Lucius Postumius, from the Adriatic upwards by the Biferno—into Samnium, there to unite in front of Bovianum the capital; a decisive victory was achieved, the Samnite general Statius Gellius was taken prisoner, and Bovianum was carried by storm.

Peace with Samnium

The fall of the chief stronghold of the land terminated the twenty-two years' war. The Samnites withdrew their garrisons from Sora and Arpinum, and sent envoys to Rome to sue for peace; the Sabellian tribes, the Marsi, Marrucini, Paeligni, Frentani, Vestini, and Picentes followed their example. The terms granted by Rome were tolerable; cessions of territory were required from some of them, from the Paeligni for instance, but they do not seem to have been of much importance. The equal alliance was renewed between the Sabellian tribes and the Romans (450).

And with Tarentum

Presumably about the same time, and in consequence doubtless of the Samnite peace, peace was also made between Rome and Tarentum. The two cities had not indeed directly opposed each other in the field. The Tarentines had been inactive spectators of the long contest between Rome and Samnium from its beginning to its close, and had only kept up hostilities in league with the Sallentines against the Lucanians who were allies of Rome. In the last years of the Samnite war no doubt they had shown some signs of more energetic action. The position of embarrassment to which the ceaseless attacks of the Lucanians reduced them on the one hand, and on the other hand the feeling ever obtruding itself on them more urgently that the complete subjugation of Samnium would endanger their own independence, induced them, notwithstanding their unpleasant experiences with Alexander, once more to entrust themselves to a -condottiere-. There came at their call the Spartan prince Cleonymus, accompanied by five thousand mercenaries; with whom he united a band equally numerous raised in Italy, as well as the contingents of the Messapians and of the smaller Greek towns, and above all the Tarentine civic army of twenty-two thousand men. At the head of this considerable force he compelled the Lucanians to make peace with Tarentum and to

install a government of Samnite tendencies; in return for which Metapontum was abandoned to them. The Samnites were still

Page 340

in arms when this occurred; there was nothing to prevent the Spartan from coming to their aid and casting the weight of his numerous army and his military skill into the scale in favour of freedom for the cities and peoples of Italy. But Tarentum did not act as Rome would in similar circumstances have acted; and prince Cleonymus himself was far from being an Alexander or a Pyrrhus. He was in no hurry to undertake a war in which he might expect more blows than booty, but preferred to make common cause with the Lucanians against Metapontum, and made himself comfortable in that city, while he talked of an expedition against Agathocles of Syracuse and of liberating the Sicilian Greeks. Thereupon the Samnites made peace; and when after its conclusion Rome began to concern herself more seriously about the south-east of the peninsula—in token of which in the year 447 a Roman force levied contributions, or rather reconnoitred by order of the government, in the territory of the Sallentines—the Spartan -condottiere- embarked with his mercenaries and surprised the island of Corcyra, which was admirably situated as a basis for piratical expeditions against Greece and Italy. Thus abandoned by their general, and at the same time deprived of their allies in central Italy, the Tarentines and their Italian allies, the Lucanians and Sallentines, had now no course left but to solicit an accommodation with Rome, which appears to have been granted on tolerable terms. Soon afterwards (451) even an incursion of Cleonymus, who had landed in the Sallentine territory and laid siege to Uria, was repulsed by the inhabitants with Roman aid.

Consolidation of the Roman Rule in Central Italy

The victory of Rome was complete; and she turned it to full account. It was not from magnanimity in the conquerors—for the Romans knew nothing of the sort—but from shrewd and far-seeing calculation that terms so moderate were granted to the Samnites, the Tarentines, and the more distant peoples generally. The first and main object was not so much to compel southern Italy as quickly as possible to recognize formally the Roman supremacy, as to supplement and complete the subjugation of central Italy, for which the way had been prepared by the military roads and fortresses already established in Campania and Apulia during the last war, and by that means to separate the northern and southern Italians into two masses cut off in a military point of view from direct contact with each other. To this object accordingly the next undertakings of the Romans were with consistent energy directed. Above all they used, or made, the opportunity for getting rid of the confederacies of the Aequi and the Hernici which had once been rivals of the Roman single power in the region of the Tiber and were not yet quite set aside. In the same year, in which the peace with Samnium took place (450), the consul Publius Sempronius Sophus waged war on the Aequi; forty townships surrendered

Page 341

in fifty days; the whole territory with the exception of the narrow and rugged mountain valley, which still in the present day bears the old name of the people (Cicolano), passed into the possession of the Romans, and here on the northern border of the Fucine lake was founded the fortress Alba with a garrison of 6000 men, thenceforth forming a bulwark against the valiant Marsi and a curb for central Italy; as was also two years afterwards on the upper Turano, nearer to Rome, Carsioli —both as allied communities with Latin rights.

The fact that in the case of the Hernici at least Anagnia had taken part in the last stage of the Samnite war, furnished the desired reason for dissolving the old relation of alliance. The fate of the Anagnines was, as might be expected, far harder than that which had under similar circumstances been meted out to the Latin communities in the previous generation. They not merely had, like these, to acquiesce in the Roman citizenship without suffrage, but they also like the Caerites lost self-administration; out of a portion of their territory on the upper Trerus (Sacco), moreover, a new tribe was instituted, and another was formed at the same time on the lower Anio (455). The only regret was that the three Hernican communities next in importance to Anagnia, Aletrium, Verulae, and Ferentinum, had not also revolted; for, as they courteously declined the suggestion that they should voluntarily enter into the bond of Roman citizenship and there existed no pretext for compelling them to do so, the Romans were obliged not only to respect their autonomy, but also to allow to them even the right of assembly and of intermarriage, and in this way still to leave a shadow of the old Hernican confederacy. No such considerations fettered their action in that portion of the Volscian country which had hitherto been held by the Samnites. There Arpinum and Frusino became subject, the latter town was deprived of a third of its domain, and on the upper Liris in addition to Fregellae the Volscian town of Sora, which had previously been garrisoned, was now permanently converted into a Roman fortress and occupied by a legion of 4000 men. In this way the old Volscian territory was completely subdued, and became rapidly Romanized. The region which separated Samnium from Etruria was penetrated by two military roads, both of which were secured by new fortresses. The northern road, which afterwards became the Flaminian, covered the line of the Tiber; it led through Ocrinum, which was in alliance with Rome, to Narnia, the name which the Romans gave to the old Umbrian fortress Nequinum when they settled a military colony there (455). The southern, afterwards the Valerian, ran along the Fucine lake by way of the just mentioned fortresses of Carsioli and Alba. The small tribes within whose bounds these colonies were instituted, the Umbrians who obstinately defended Nequinum, the Aequians who once more assailed Alba, and the Marsians who attacked

Page 342

Carsioli, could not arrest the course of Rome: the two strong curb-fortresses were inserted almost without hindrance between Samnium and Etruria. We have already mentioned the great roads and fortresses instituted for permanently securing Apulia and above all Campania: by their means Samnium was further surrounded on the east and west with the net of Roman strongholds. It is a significant token of the comparative weakness of Etruria that it was not deemed necessary to secure the passes through the Ciminian Forest in a similar mode—by a highway and corresponding fortresses. The former frontier fortress of Sutrium continued to be in this quarter the terminus of the Roman military line, and the Romans contented themselves with having the road leading thence to Arretium kept in a serviceable state for military purposes by the communities through whose territories it passed.(4)

Renewed Outbreak of the Samnite-Etruscan War— Junction of the Troops of the Coalition in Etruria

The high-spirited Samnite nation perceived that such a peace was more ruinous than the most destructive war; and, what was more, it acted accordingly. The Celts in northern Italy were just beginning to bestir themselves again after a long suspension of warfare; moreover several Etruscan communities there were still in arms against the Romans, and brief armistices alternated in that quarter with vehement but indecisive conflicts. All central Italy was still in ferment and partly in open insurrection; the fortresses were still only in course of construction; the way between Etruria and Samnium was not yet completely closed. Perhaps it was not yet too late to save freedom; but, if so, there must be no delay; the difficulty of attack increased, the power of the assailants diminished with every year by which the peace was prolonged. Five years had scarce elapsed since the contest ended, and all the wounds must still have been bleeding which the twenty-two years' war had inflicted on the peasantry of Samnium, when in the year 456 the Samnite confederacy renewed the struggle. The last war had been decided in favour of Rome mainly through the alliance of Lucania with the Romans and the consequent standing aloof of Tarentum. The Samnites, profiting by that lesson, now threw themselves in the first instance with all their might on the Lucanians, and succeeded in bringing their party in that quarter to the helm of affairs, and in concluding an alliance between Samnium and Lucania. Of course the Romans immediately declared war; the Samnites had expected no other issue. It is a significant indication of the state of feeling, that the Samnite government informed the Roman envoys that it was not able to guarantee their inviolability, if they should set foot on Samnite ground.

Page 343

The war thus began anew (456), and while a second army was fighting in Etruria, the main Roman army traversed Samnium and compelled the Lucanians to make peace and send hostages to Rome. The following year both consuls were able to proceed to Samnium; Rullianus conquered at Tifernum, his faithful comrade in arms, Publius Decius Mus, at Maleventum, and for five months two Roman armies encamped in the land of the enemy. They were enabled to do so, because the Tuscan states had on their own behalf entered into negotiations for peace with Rome. The Samnites, who from the beginning could not but see that their only chance of victory lay in the combination of all Italy against Rome, exerted themselves to the utmost to prevent the threatened separate peace between Etruria and Rome; and when at last their general, Gellius Egnatius, offered to bring aid to the Etruscans in their own country, the Etruscan federal council in reality agreed to hold out and once more to appeal to the decision of arms. Samnium made the most energetic efforts to place three armies simultaneously in the field, the first destined for the defence of its own territory, the second for an invasion of Campania, the third and most numerous for Etruria; and in the year 458 the last, led by Egnatius himself, actually reached Etruria in safety through the Marsian and Umbrian territories, with whose inhabitants there was an understanding. Meanwhile the Romans were capturing some strong places in Samnium and breaking the influence of the Samnite party in Lucania; they were not in a position to prevent the departure of the army led by Egnatius. When information reached Rome that the Samnites had succeeded in frustrating all the enormous efforts made to sever the southern from the northern Italians, that the arrival of the Samnite bands in Etruria had become the signal for an almost universal rising against Rome, and that the Etruscan communities were labouring with the utmost zeal to get their own forces ready for war and to take into their pay Gallic bands, every nerve was strained also in Rome; the freedmen and the married were formed into cohorts—it was felt on all hands that the decisive crisis was near. The year 458 however passed away, apparently, in armings and marchings. For the following year (459) the Romans placed their two best generals, Publius Decius Mus and the aged Quintus Fabius Rullianus, at the head of their army in Etruria, which was reinforced with all the troops that could be spared from Campania, and amounted to at least 60,000 men, of whom more than a third were full burgesses of Rome. Besides this, two reserves were formed, the first at Falerii, the second under the walls of the capital. The rendezvous of the Italians was Umbria, towards which the roads from the Gallic, Etruscan, and Sabellian territories converged; towards Umbria the consuls also moved off their main force, partly along the left, partly along the right bank of the Tiber, while at the same time the first reserve made a movement

Page 344

towards Etruria, in order if possible to recall the Etruscan troops from the main scene of action for the defence of their homes. The first engagement did not prove fortunate for the Romans; their advanced guard was defeated by the combined Gauls and Samnites in the district of Chiusi. But that diversion accomplished its object. Less magnanimous than the Samnites, who had marched through the ruins of their towns that they might not be absent from the chosen field of battle, a great part of the Etruscan contingents withdrew from the federal army on the news of the advance of the Roman reserve into Etruria, and its ranks were greatly thinned when the decisive battle came to be fought on the eastern declivity of the Apennines near Sentinum.

Battle of Sentinum—
Peace with Etruria

Nevertheless it was a hotly contested day. On the right wing of the Romans, where Rullianus with his two legions fought against the Samnite army, the conflict remained long undecided. On the left, which Publius Decius commanded, the Roman cavalry was thrown into confusion by the Gallic war chariots, and the legions also already began to give way. Then the consul called to him Marcus Livius the priest, and bade him devote to the infernal gods both the head of the Roman general and the army of the enemy; and plunging into the thickest throng of the Gauls he sought death and found it. This heroic deed of despair on the part of one so eminent as a man and so beloved as a general was not in vain. The fugitive soldiers rallied; the bravest threw themselves after their leader into the hostile ranks, to avenge him or to die with him; and just at the right moment the consular Lucius Scipio, despatched by Rullianus, appeared with the Roman reserve on the imperilled left wing. The excellent Campanian cavalry, which fell on the flank and rear of the Gauls, turned the scale; the Gauls fled, and at length the Samnites also gave way, their general Egnatius falling at the gate of the camp. Nine thousand Romans strewed the field of battle; but dearly as the victory was purchased, it was worthy of such a sacrifice. The army of the coalition was dissolved, and with it the coalition itself; Umbria remained in the power of the Romans, the Gauls dispersed, the remnant of the Samnites still in compact order retreated homeward through the Abruzzi. Campania, which the Samnites had overrun during the Etruscan war, was after its close re-occupied with little difficulty by the Romans. Etruria sued for peace in the following year (460); Volsinii, Perugia, Arretium, and in general all the towns that had joined the league against Rome, promised a cessation of hostilities for four hundred months.

Last Struggles of Samnium

Page 345

But the Samnites were of a different mind; they prepared for their hopeless resistance with the courage of free men, which cannot compel success but may put it to shame. When the two consular armies advanced into Samnium, in the year 460, they encountered everywhere the most desperate resistance; in fact Marcus Atilius was discomfited near Luceria, and the Samnites were able to penetrate into Campania and to lay waste the territory of the Roman colony Interamna on the Liris. In the ensuing year Lucius Papirius Cursor, the son of the hero of the first Samnite war, and Spurius Carvilius, gave battle on a great scale near Aquilonia to the Samnite army, the flower of which—the 16,000 in white tunics—had sworn a sacred oath to prefer death to flight. Inexorable destiny, however, heeds neither the oaths nor the supplications of despair; the Roman conquered and stormed the strongholds where the Samnites had sought refuge for themselves and their property. Even after this great defeat the confederates still for years resisted the ever-increasing superiority of the enemy with unparalleled perseverance in their fastnesses and mountains, and still achieved various isolated advantages. The experienced arm of the old Rullianus was once more called into the field against them (462), and Gavius Pontius, a son perhaps of the victor of Caudium, even gained for his nation a last victory, which the Romans meanly enough avenged by causing him when subsequently taken to be executed in prison (463). But there was no further symptom of movement in Italy; for the war, which Falerii began in 461, scarcely deserves such a name. The Samnites doubtless turned with longing eyes towards Tarentum, which alone was still in a position to grant them aid; but it held aloof. The same causes as before occasioned its inaction—internal misgovernment, and the passing over of the Lucanians once more to the Roman party in the year 456; to which fell to be added a not unfounded dread of Agathocles of Syracuse, who just at that time had reached the height of his power and began to turn his views towards Italy. About 455 the latter established himself in Corcyra whence Cleonymus had been expelled by Demetrius Poliorcetes, and now threatened the Tarentines from the Adriatic as well as from the Ionian sea. The cession of the island to king Pyrrhus of Epirus in 459 certainly removed to a great extent the apprehensions which they had cherished; but the affairs of Corcyra continued to occupy the Tarentines—in the year 464, for instance, they helped to protect Pyrrhus in possession of the island against Demetrius—and in like manner Agathocles did not cease to give the Tarentines uneasiness by his Italian policy. When he died (465) and with him the power of the Syracusans in Italy went to wreck, it was too late; Samnium, weary of the thirty-seven years' struggle, had concluded peace in the previous year (464) with the Roman consul Manius Curius Dentatus, and had in form

Page 346

renewed its league with Rome. On this occasion, as in the peace of 450, no disgraceful or destructive conditions were imposed on the brave people by the Romans; no cessions even of territory seem to have taken place. The political sagacity of Rome preferred to follow the path which it had hitherto pursued, and to attach in the first place the Campanian and Adriatic coast more and more securely to Rome before proceeding to the direct conquest of the interior. Campania, indeed, had been long in subjection; but the far-seeing policy of Rome found it needful, in order to secure the Campanian coast, to establish two coast-fortresses there, Minturnae and Sinuessa (459), the new burgesses of which were admitted according to the settled rule in the case of maritime colonies to the full citizenship of Rome. With still greater energy the extension of the Roman rule was prosecuted in central Italy. As the subjugation of the Aequi and Hernici was the immediate sequel of the first Samnite war, so that of the Sabines followed on the end of the second. The same general, who ultimately subdued the Samnites, Manius Curius broke down in the same year (464) the brief and feeble resistance of the Sabines and forced them to unconditional surrender. A great portion of the subjugated territory was immediately taken into possession of the victors and distributed to Roman burgesses, and Roman subject-rights (-civitas sine suffragio-) were imposed on the communities that were left—Cures, Reate, Amiternum, Nursia. Allied towns with equal rights were not established here; on the contrary the country came under the immediate rule of Rome, which thus extended as far as the Apennines and the Umbrian mountains. Nor was it even now restricted to the territory on Rome's side of the mountains; the last war had shown but too clearly that the Roman rule over central Italy was only secured, if it reached from sea to sea. The establishment of the Romans beyond the Apennines begins with the laying out of the strong fortress of Atria (Atri) in the year 465, on the northern slope of the Abruzzi towards the Picenian plain, not immediately on the coast and hence with Latin rights, but still near to the sea, and the keystone of the mighty wedge separating northern and southern Italy. Of a similar nature and of still greater importance was the founding of Venusia (463), whither the unprecedented number of 20,000 colonists was conducted. That city, founded at the boundary of Samnium, Apulia, and Lucania, on the great road between Tarentum and Samnium, in an uncommonly strong position, was destined as a curb to keep in check the surrounding tribes, and above all to interrupt the communications between the two most powerful enemies of Rome in southern Italy. Beyond doubt at the same time the southern highway, which Appius Claudius had carried as far as Capua, was prolonged thence to Venusia. Thus, at the close of the Samnite wars, the Roman domain closely compact—that is, consisting almost exclusively

Page 347

of communities with Roman or Latin rights—extended on the north to the Ciminian Forest, on the east to the Abruzzi and to the Adriatic, on the south as far as Capua, while the two advanced posts, Luceria and Venusia, established towards the east and south on the lines of communication of their opponents, isolated them on every side. Rome was no longer merely the first, but was already the ruling power in the peninsula, when towards the end of the fifth century of the city those nations, which had been raised to supremacy in their respective lands by the favour of the gods and by their own capacity, began to come into contact in council and on the battle-field; and, as at Olympia the preliminary victors girt themselves for a second and more serious struggle, so on the larger arena of the nations, Carthage, Macedonia, and Rome now prepared for the final and decisive contest.

Notes for Book II Chapter VI

1. It may not be superfluous to mention that our knowledge Archidamus and Alexander is derived from Greek annals, and that the synchronism between these and the Roman is in reference to the present epoch only approximately established. We must beware, therefore, of pursuing too far into detail the unmistakable general connection between the events in the west and those in the east of Italy.
2. These were not the inhabitants of Satricum near Antium (*ii.* V. League with The Hernici), but those of another Volscian town constituted at that time as a Roman burgess-community without right of voting, near Arpinum.
3. That a formal armistice for two years subsisted between the Romans and Samnites in 436-437 is more than improbable.
4. The operations in the campaign of 537, and still more plainly the formation of the highway from Arretium to Bononia in 567, show that the road from Rome to Arretium had already been rendered serviceable before that time. But it cannot at that period have been a Roman military road, because, judging from its later appellation of the "Cassian way," it cannot have been constructed as a -via consularis-earlier than 583; for no Cassian appears in the lists of Roman consuls and censors between Spurius Cassius, consul in 252, 261, and 268—who of course is out of the question—and Gaius Cassius Longinus, consul in 583.

CHAPTER VII

Struggle between Pyrrhus and Rome, and Union of Italy

Relations between the East and West

Page 348

After Rome had acquired the undisputed mastery of the world, the Greeks were wont to annoy their Roman masters by the assertion that Rome was indebted for her greatness to the fever of which Alexander of Macedonia died at Babylon on the 11th of June, 431. As it was not too agreeable for them to reflect on the actual past, they were fond of allowing their thoughts to dwell on what might have happened, had the great king turned his arms—as was said to have been his intention at the time of his death—towards the west and contested the Carthaginian supremacy by sea with his fleet, and the Roman supremacy by land with his phalanxes. It is not impossible that Alexander may have cherished such thoughts; nor is it necessary to resort for an explanation of their origin to the mere difficulty which an autocrat, who is fond of war and is well provided with soldiers and ships, experiences in setting limits to his warlike career. It was an enterprise worthy of a Greek great king to protect the Siceliots against Carthage and the Tarentines against Rome, and to put an end to piracy on either sea; and the Italian embassies from the Bruttians, Lucanians, and Etruscans,(1) that along with numerous others made their appearance at Babylon, afforded him sufficient opportunities of becoming acquainted with the circumstances of the peninsula and of entering into relations with it. Carthage with its many connections in the east could not but attract the attention of the mighty monarch, and it was probably one of his designs to convert the nominal sovereignty of the Persian king over the Tyrian colony into a real one: it was not for nothing that a Phoenician spy was found in the retinue of Alexander. Whether, however, these ideas were dreams or actual projects, the king died without having interfered in the affairs of the west, and his ideas were buried with him. For but a few brief years a Greek ruler had held in his hand the whole intellectual vigour of the Hellenic race combined with the whole material resources of the east. On his death the work to which his life had been devoted—the establishment of Hellenism in the east—was by no means undone; but his empire had barely been united when it was again dismembered, and, amidst the constant quarrels of the different states that were formed out of its ruins, the object of world-wide interest which they were destined to promote—the diffusion of Greek culture in the east—though not abandoned, was prosecuted on a feeble and stunted scale. Under such circumstances, neither the Greek nor the Asiatico-Egyptian states could think of acquiring a footing in the west or of turning their efforts against the Romans or the Carthaginians. The eastern and western state-systems subsisted side by side for a time without crossing, politically, each other's path; and Rome in particular remained substantially aloof from the complications in the days of Alexander's successors. The only relations established were of a mercantile kind; as in the instance

Page 349

of the free state of Rhodes, the leading representative of the policy of commercial neutrality in Greece and in consequence the universal medium of intercourse in an age of perpetual wars, which about 448 concluded a treaty with Rome—a commercial convention of course, such as was natural between a mercantile people and the masters of the Caerite and Campanian coasts. Even in the supply of mercenaries from Hellas, the universal recruiting field of those times, to Italy, and to Tarentum in particular, political relations—such as subsisted, for instance, between Tarentum and Sparta its mother-city—exercised but a very subordinate influence. In general the raising of mercenaries was simply a matter of traffic, and Sparta, although it regularly supplied the Tarentines with captains for their Italian wars, was by that course as little involved in hostilities with the Italians, as in the North American war of independence the German states were involved in hostilities with the Union, to whose opponents they sold the services of their subjects.

The Historical Position of Pyrrhus

Pyrrhus, king of Epirus, was himself simply a military adventurer. He was none the less a soldier of fortune that he traced back his pedigree to Aeacus and Achilles, and that, had he been more peacefully disposed, he might have lived and died as “king” of a small mountain tribe under the supremacy of Macedonia or perhaps in isolated independence. He has been compared to Alexander of Macedonia; and certainly the idea of founding a Hellenic empire of the west—which would have had as its core Epirus, Magna Graecia, and Sicily, would have commanded both the Italian seas, and would have reduced Rome and Carthage to the rank of barbarian peoples bordering on the Hellenistic state-system, like the Celts and the Indians—was analogous in greatness and boldness to the idea which led the Macedonian king over the Hellespont. But it was not the mere difference of issue that formed the distinction between the expedition to the east and that to the west. Alexander with his Macedonian army, in which the staff especially was excellent, could fully make head against the great-king; but the king of Epirus, which stood by the side of Macedonia somewhat as Hesse by the side of Prussia, could only raise an army worthy of the name by means of mercenaries and of alliances based on accidental political combinations. Alexander made his appearance in the Persian empire as a conqueror; Pyrrhus appeared in Italy as the general of a coalition of secondary states. Alexander left his hereditary dominions completely secured by the unconditional subjection of Greece, and by the strong army that remained behind under Antipater; Pyrrhus had no security for the integrity of his native dominions but the word of a doubtful neighbour. In the case of both conquerors, if their plans should be crowned with success, their native country would necessarily cease to be the centre

Page 350

of their new empire; but it was far more practicable to transfer the seat of the Macedonian military monarchy to Babylon than to found a soldier-dynasty in Tarentum or Syracuse. The democracy of the Greek republics—perpetual agony though it was—could not be at all coerced into the stiff forms of a military state; Philip had good reason for not incorporating the Greek republics with his empire. In the east no national resistance was to be expected; ruling and subject races had long lived there side by side, and a change of despot was a matter of indifference or even of satisfaction to the mass of the population. In the west the Romans, the Samnites, the Carthaginians, might be vanquished; but no conqueror could have transformed the Italians into Egyptian fellahs, or rendered the Roman farmers tributaries of Hellenic barons. Whatever we take into view—whether their own power, their allies, or the resources of their antagonists—in all points the plan of the Macedonian appears as a feasible, that of the Epirot an impracticable, enterprise; the former as the completion of a great historical task, the latter as a remarkable blunder; the former as the foundation of a new system of states and of a new phase of civilization, the latter as a mere episode in history. The work of Alexander outlived him, although its creator met an untimely death; Pyrrhus saw with his own eyes the wreck of all his plans, ere death called him away. Both were by nature daring and great, but Pyrrhus was only the foremost general, Alexander was eminently the most gifted statesman, of his time; and, if it is insight into what is and what is not possible that distinguishes the hero from the adventurer, Pyrrhus must be numbered among the latter class, and may as little be placed on a parallel with his greater kinsman as the Constable of Bourbon may be put in comparison with Louis the Eleventh.

And yet a wondrous charm attaches to the name of the Epirot—a peculiar sympathy, evoked certainly in some degree by his chivalrous and amiable character, but still more by the circumstance that he was the first Greek that met the Romans in battle. With him began those direct relations between Rome and Hellas, on which the whole subsequent development of ancient, and an essential part of modern, civilization are based. The struggle between phalanxes and cohorts, between a mercenary army and a militia, between military monarchy and senatorial government, between individual talent and national vigour—this struggle between Rome and Hellenism was first fought out in the battles between Pyrrhus and the Roman generals; and though the defeated party often afterwards appealed anew to the arbitration of arms, every succeeding day of battle simply confirmed the decision. But while the Greeks were beaten in the battlefield as well as in the senate-hall, their superiority was none the less decided on every other field of rivalry than that of politics; and these very struggles already betokened that the victory of Rome over the Hellenes would be different from her victories over Gauls and Phoenicians, and that the charm of Aphrodite only begins to work when the lance is broken and the helmet and shield are laid aside.

Page 351

Character and Earlier History of Pyrrhus

King Pyrrhus was the son of Aeacides, ruler of the Molossians (about Janina), who, spared as a kinsman and faithful vassal by Alexander, had been after his death drawn into the whirlpool of Macedonian family-politics, and lost in it first his kingdom and then his life (441). His son, then six years of age, was saved by Glaucias the ruler of the Illyrian Taulantii, and in the course of the conflicts for the possession of Macedonia he was, when still a boy, restored by Demetrius Poliorcetes to his hereditary principality (447)—but only to lose it again after a few years through the influence of the opposite party (about 452), and to begin his military career as an exiled prince in the train of the Macedonian generals. Soon his personality asserted itself. He shared in the last campaigns of Antigonus; and the old marshal of Alexander took delight in the born soldier, who in the judgment of the grey-headed general only wanted years to be already the first warrior of the age. The unfortunate battle at Ipsus brought him as a hostage to Alexandria, to the court of the founder of the Lagid dynasty, where by his daring and downright character, and his soldierly spirit thoroughly despising everything that was not military, he attracted the attention of the politic king Ptolemy no less than he attracted the notice of the royal ladies by his manly beauty, which was not impaired by his wild look and stately tread. Just at this time the enterprising Demetrius was once more establishing himself in a new kingdom, which on this occasion was Macedonia; of course with the intention of using it as a lever to revive the monarchy of Alexander. To keep down his ambitious designs, it was important to give him employment at home; and Ptolemy, who knew how to make admirable use of such fiery spirits as the Epirot youth in the prosecution of his subtle policy, not only met the wishes of his consort queen Berenice, but also promoted his own ends, by giving his stepdaughter the princess Antigone in marriage to the young prince, and lending his aid and powerful influence to support the return of his beloved “son” to his native land (458). Restored to his paternal kingdom, he soon carried all before him. The brave Epirots, the Albanians of antiquity, clung with hereditary loyalty and fresh enthusiasm to the high-spirited youth—the “eagle,” as they called him. In the confusion that arose regarding the succession to the Macedonian throne after the death of Cassander (457), the Epirot extended his dominions: step by step he gained the regions on the Ambracian gulf with the important town of Ambracia, the island of Corcyra,(2) and even a part of the Macedonian territory, and with forces far inferior he made head against king Demetrius to the admiration of the Macedonians themselves. Indeed, when Demetrius was by his own folly hurled from the Macedonian throne, it was voluntarily proffered by them to his chivalrous opponent,

Page 352

a kinsman of the Alexandrid house (467). No one was in reality worthier than Pyrrhus to wear the royal diadem of Philip and of Alexander. In an age of deep depravity, in which princely rank and baseness began to be synonymous, the personally unspotted and morally pure character of Pyrrhus shone conspicuous. For the free farmers of the hereditary Macedonian soil, who, although diminished and impoverished, were far from sharing in that decay of morals and of valour which the government of the Diadochi produced in Greece and Asia, Pyrrhus appeared exactly formed to be the fitting king, —Pyrrhus, who, like Alexander, in his household and in the circle of his friends preserved a heart open to all human sympathies, and constantly avoided the bearing of an Oriental sultan which was so odious to the Macedonians; and who, like Alexander, was acknowledged to be the first tactician of his time. But the singularly overstrained national feeling of the Macedonians, which preferred the most paltry Macedonian sovereign to the ablest foreigner, and the irrational insubordination of the Macedonian troops towards every non-Macedonian leader, to which Eumenes the Cardian, the greatest general of the school of Alexander, had fallen a victim, put a speedy termination to the rule of the prince of Epirus. Pyrrhus, who could not exercise sovereignty over Macedonia with the consent of the Macedonians, and who was too powerless and perhaps too high spirited to force himself on the nation against its will, after reigning seven months left the country to its native misgovernment, and went home to his faithful Epirots (467). But the man who had worn the crown of Alexander, the brother-in-law of Demetrius, the son-in-law of Ptolemy Lagides and of Agathocles of Syracuse, the highly-trained tactician who wrote memoirs and scientific dissertations on the military art, could not possibly end his days in inspecting at a set time yearly the accounts of the royal cattle steward, in receiving from his brave Epirots their customary gifts of oxen and sheep, in thereupon, at the altar of Zeus, procuring the renewal of their oath of allegiance and repeating his own engagement to respect the laws, and—for the better confirmation of the whole—in carousing with them all night long. If there was no place for him on the throne of Macedonia, there was no abiding in the land of his nativity at all; he was fitted for the first place, and he could not be content with the second. His views therefore turned abroad. The kings, who were quarrelling for the possession of Macedonia, although agreeing in nothing else, were ready and glad to concur in aiding the voluntary departure of their dangerous rival; and that his faithful war-comrades would follow him where-ever he led, he knew full well. Just at that time the circumstances of Italy were such, that the project which had been meditated forty years before by Pyrrhus's kinsman, his father's cousin, Alexander of Epirus, and quite recently by his father-in-law Agathocles, once more seemed feasible; and so Pyrrhus resolved to abandon his Macedonian schemes and to found for himself and for the Hellenic nation a new empire in the west.

Page 353

Rising of the Italians against Rome—

The Lucanians—

The Etruscans and Celts—

The Samnites—

The Senones Annihilated

The interval of repose, which the peace with Samnium in 464 had procured for Italy, was of brief duration; the impulse which led to the formation of a new league against Roman ascendancy came on this occasion from the Lucanians. This people, by taking part with Rome during the Samnite wars, paralyzed the action of the Tarentines and essentially contributed to the decisive issue; and in consideration of their services, the Romans gave up to them the Greek cities in their territory. Accordingly after the conclusion of peace they had, in concert with the Bruttians, set themselves to subdue these cities in succession. The Thurines, repeatedly assailed by Stenius Statilius the general of the Lucanians and reduced to extremities, applied for assistance against the Lucanians to the Roman senate—just as formerly the Campanians had asked the aid of Rome against the Samnites—and beyond doubt with a like sacrifice of their liberty and independence. In consequence of the founding of the fortress Venusia, Rome could dispense with the alliance of the Lucanians; so the Romans granted the prayer of the Thurines, and enjoined their friends and allies to desist from their designs on a city which had surrendered itself to Rome. The Lucanians and Bruttians, thus cheated by their more powerful allies of their share in the common spoil, entered into negotiations with the opposition-party among the Samnites and Tarentines to bring about a new Italian coalition; and when the Romans sent an embassy to warn them, they detained the envoys in captivity and began the war against Rome with a new attack on Thurii (about 469), while at the same time they invited not only the Samnites and Tarentines, but the northern Italians also—the Etruscans, Umbrians, and Gauls—to join them in the struggle for freedom. The Etruscan league actually revolted, and hired numerous bands of Gauls; the Roman army, which the praetor Lucius Caecilius was leading to the help of the Arretines who had remained faithful, was annihilated under the walls of Arretium by the Senonian mercenaries of the Etruscans: the general himself fell with 13,000 of his men (470). The Senones were reckoned allies of Rome; the Romans accordingly sent envoys to them to complain of their furnishing warriors to serve against Rome, and to require the surrender of their captives without ransom. But by the command of their chieftain Britomaris, who had to take vengeance on the Romans for the death of his father, the Senones slew the Roman envoys and openly took the Etruscan side. All the north of Italy, Etruscans, Umbrians, Gauls, were thus in arms against Rome; great results might be achieved, if its southern provinces also should seize the moment and declare, so far as they had not already done so, against Rome. In fact the Samnites, ever ready to make a stand on behalf of liberty, appear to have

Page 354

declared war against the Romans; but weakened and hemmed in on all sides as they were, they could be of little service to the league; and Tarentum manifested its wonted delay. While her antagonists were negotiating alliances, settling treaties as to subsidies, and collecting mercenaries, Rome was acting. The Senones were first made to feel how dangerous it was to gain a victory over the Romans. The consul Publius Cornelius Dolabella advanced with a strong army into their territory; all that were not put to the sword were driven forth from the land, and this tribe was erased from the list of the Italian nations (471). In the case of a people subsisting chiefly on its flocks and herds such an expulsion en masse was quite practicable; and the Senones thus expelled from Italy probably helped to make up the Gallic hosts which soon after inundated the countries of the Danube, Macedonia, Greece, and Asia Minor.

The Boii

The next neighbours and kinsmen of the Senones, the Boii, terrified and exasperated by a catastrophe which had been accomplished with so fearful a rapidity, united instantaneously with the Etruscans, who still continued the war, and whose Senonian mercenaries now fought against the Romans no longer as hirelings, but as desperate avengers of their native land. A powerful Etrusco-Gallic army marched against Rome to retaliate the annihilation of the Senonian tribe on the enemy's capital, and to extirpate Rome from the face of the earth more completely than had been formerly done by the chieftain of these same Senones. But the combined army was decidedly defeated by the Romans at its passage of the Tiber in the neighbourhood of the Vadimonian lake (471). After they had once more in the following year risked a general engagement near Populonia with no better success, the Boii deserted their confederates and concluded a peace on their own account with the Romans (472). Thus the Gauls, the most formidable member of the league, were conquered in detail before the league was fully formed, and by that means the hands of Rome were left free to act against Lower Italy, where during the years 469-471 the contest had not been carried on with any vigour. Hitherto the weak Roman army had with difficulty maintained itself in Thurii against the Lucanians and Bruttians; but now (472) the consul Gaius Fabricius Luscinius appeared with a strong army in front of the town, relieved it, defeated the Lucanians in a great engagement, and took their general Statilius prisoner. The smaller non-Doric Greek towns, recognizing the Romans as their deliverers, everywhere voluntarily joined them. Roman garrisons were left behind in the most important places, in Locri, Croton, Thurii, and especially in Rhegium, on which latter town the Carthaginians seem also to have had designs. Everywhere Rome had most decidedly the advantage. The annihilation of the Senones had given to the Romans a considerable tract of the Adriatic coast. With a view, doubtless,

Page 355

to the smouldering feud with Tarentum and the already threatened invasion of the Epirots, they hastened to make themselves sure of this coast as well as of the Adriatic sea. A burgess colony was sent out (about 471) to the seaport of Sena (Sinigaglia), the former capital of the Senonian territory; and at the same time a Roman fleet sailed from the Tyrrhene sea into the eastern waters, manifestly for the purpose of being stationed in the Adriatic and of protecting the Roman possessions there.

Breach between Rome and Tarentum

The Tarentines since the treaty of 450 had lived at peace with Rome. They had been spectators of the long struggle of the Samnites, and of the rapid extirpation of the Senones; they had acquiesced without remonstrance in the establishment of Venusia, Atria, and Sena, and in the occupation of Thurii and of Rhegium. But when the Roman fleet, on its voyage from the Tyrrhene to the Adriatic sea, now arrived in the Tarentine waters and cast anchor in the harbour of the friendly city, the long, cherished resentment at length overflowed. Old treaties, which prohibited the war-vessels of Rome from sailing to the east of the Lacinian promontory, were appealed to by popular orators in the assembly of the citizens. A furious mob fell upon the Roman ships of war, which, assailed suddenly in a piratical fashion, succumbed after a sharp struggle; five ships were taken and their crews executed or sold into slavery; the Roman admiral himself had fallen in the engagement. Only the supreme folly and supreme unscrupulousness of mob-rule can account for those disgraceful proceedings. The treaties referred to belonged to a period long past and forgotten; it is clear that they no longer had any meaning, at least subsequently to the founding of Atria and Sena, and that the Romans entered the bay on the faith of the existing alliance; indeed, it was very much their interest—as the further course of things showed—to afford the Tarentines no sort of pretext for declaring war. In declaring war against Rome—if such was their wish—the statesmen of Tarentum were only doing what they should have done long before; and if they preferred to rest their declaration of war upon the formal pretext of a breach of treaty rather than upon the real ground, no further objection could be taken to that course, seeing that diplomacy has always reckoned it beneath its dignity to speak the plain truth in plain language. But to make an armed attack upon the fleet without warning, instead of summoning the admiral to retrace his course, was a foolish no less than a barbarous act—one of those horrible barbarities of civilization, when moral principle suddenly forsakes the helm and the merest coarseness emerges in its room, as if to warn us against the childish belief that civilization is able to extirpate brutality from human nature.

And, as if what they had done had not been enough, the Tarentines after this heroic feat attacked Thurii, the Roman garrison of which capitulated in consequence of the surprise (in the winter of 472-473); and inflicted: severe chastisement on the Thurines—the same, whom Tarentine policy had abandoned to the Lucanians and thereby forcibly

constrained into surrender to Rome—for their desertion from the Hellenic party to the barbarians.

Page 356

Attempts at Peace

The barbarians, however, acted with a moderation which, considering their power and the provocation they had received, excites astonishment. It was the interest of Rome to maintain as long as possible the Tarentine neutrality, and the leading men in the senate accordingly rejected the proposal, which a minority had with natural resentment submitted, to declare war at once against the Tarentines. In fact, the continuance of peace on the part of Rome was proffered on the most moderate terms consistent with her honour—the release of the captives, the restoration of Thurii, the surrender of the originators of the attack on the fleet. A Roman embassy proceeded with these proposals to Tarentum (473), while at the same time, to add weight to their words, a Roman army under the consul Lucius Aemilius advanced into Samnium. The Tarentines could, without forfeiting aught of their independence, accept these terms; and considering the little inclination for war in so wealthy a commercial city, the Romans had reason to presume that an accommodation was still possible. But the attempt to preserve peace failed, whether through the opposition of those Tarentines who recognized the necessity of meeting the aggressions of Rome, the sooner the better, by a resort to arms, or merely through the unruliness of the city rabble, which with characteristic Greek naughtiness subjected the person of the envoy to an unworthy insult. The consul now advanced into the Tarentine territory; but instead of immediately commencing hostilities, he offered once more the same terms of peace; and, when this proved in vain, he began to lay waste the fields and country houses, and he defeated the civic militia. The principal persons captured, however, were released without ransom; and the hope was not abandoned that the pressure of war would give to the aristocratic party ascendancy in the city and so bring about peace. The reason of this reserve was, that the Romans were unwilling to drive the city into the arms of the Epirot king. His designs on Italy were no longer a secret. A Tarentine embassy had already gone to Pyrrhus and returned without having accomplished its object. The king had demanded more than it had powers to grant. It was necessary that they should come to a decision. That the civic militia knew only how to run away from the Romans, had been made sufficiently clear. There remained only the choice between a peace with Rome, which the Romans still were ready to agree to on equitable terms, and a treaty with Pyrrhus on any condition that the king might think proper; or, in other words, the choice between submission to the supremacy of Rome, and subjection to the —tyrannis— of a Greek soldier.

Pyrrhus Summoned to Italy

Page 357

The parties in the city were almost equally balanced. At length the ascendancy remained with the national party—a result, that was due partly to the justifiable predilection which led them, if they must yield to a master at all, to prefer a Greek to a barbarian, but partly also to the dread of the demagogues that Rome, notwithstanding the moderation now forced upon it by circumstances, would not neglect on a fitting opportunity to exact vengeance for the outrages perpetrated by the Tarentine rabble. The city, accordingly, came to terms with Pyrrhus. He obtained the supreme command of the troops of the Tarentines and of the other Italians in arms against Rome, along with the right of keeping a garrison in Tarentum. The expenses of the war were, of course, to be borne by the city. Pyrrhus, on the other hand, promised to remain no longer in Italy than was necessary; probably with the tacit reservation that his own judgment should fix the time during which he would be needed there. Nevertheless, the prey had almost slipped out of his hands. While the Tarentine envoys—the chiefs, no doubt, of the war party—were absent in Epirus, the state of feeling in the city, now hard pressed by the Romans, underwent a change. The chief command was already entrusted to Agis, a man favourable to Rome, when the return of the envoys with the concluded treaty, accompanied by Cineas the confidential minister of Pyrrhus, again brought the war party to the helm.

Landing of Pyrrhus

A firmer hand now grasped the reins, and put an end to the pitiful vacillation. In the autumn of 473 Milo, the general of Pyrrhus, landed with 3000 Epirots and occupied the citadel of the town. He was followed in the beginning of the year 474 by the king himself, who landed after a stormy passage in which many lives were lost. He transported to Tarentum a respectable but miscellaneous army, consisting partly of the household troops, Molossians, Thesprotians, Chaonians, and Ambraciots; partly of the Macedonian infantry and the Thessalian cavalry, which Ptolemy king of Macedonia had conformably to stipulation handed over to him; partly of Aetolian, Acarnanian, and Athamanian mercenaries. Altogether it numbered 20,000 phalangitae, 2000 archers, 500 slingers, 3000 cavalry, and 20 elephants, and thus was not much smaller than the army with which fifty years before Alexander had crossed the Hellespont

Pyrrhus and the Coalition

The affairs of the coalition were in no very favourable state when the king arrived. The Roman consul indeed, as soon as he saw the soldiers of Milo taking the field against him instead of the Tarentine militia, had abandoned the attack on Tarentum and retreated to Apulia; but, with the exception of the territory of Tarentum, the Romans virtually ruled all Italy. The coalition had no army in the field anywhere in Lower Italy; and in Upper Italy the Etruscans, who alone were still in arms, had in the last campaign

Page 358

(473) met with nothing but defeat. The allies had, before the king embarked, committed to him the chief command of all their troops, and declared that they were able to place in the field an army of 350,000 infantry and 20,000 cavalry. The reality formed a sad contrast to these great promises. The army, whose chief command had been committed to Pyrrhus, had still to be created; and for the time being the main resources available for forming it were those of Tarentum alone. The king gave orders for the enlisting of an army of Italian mercenaries with Tarentine money, and called out the able-bodied citizens to serve in the war. But the Tarentines had not so understood the agreement. They had thought to purchase victory, like any other commodity, with money; it was a sort of breach of contract, that the king should compel them to fight for it themselves. The more glad the citizens had been at first after Milo's arrival to be quit of the burdensome service of mounting guard, the more unwillingly they now rallied to the standards of the king: it was necessary to threaten the negligent with the penalty of death. This result now justified the peace party in the eyes of all, and communications were entered into, or at any rate appeared to have been entered into, even with Rome. Pyrrhus, prepared for such opposition, immediately treated Tarentum as a conquered city; soldiers were quartered in the houses, the assemblies of the people and the numerous clubs (—sussitia—) were suspended, the theatre was shut, the promenades were closed, and the gates were occupied with Epirot guards. A number of the leading men were sent over the sea as hostages; others escaped the like fate by flight to Rome. These strict measures were necessary, for it was absolutely impossible in any sense to rely upon the Tarentines. It was only now that the king, in possession of that important city as a basis, could begin operations in the field.

Preparations in Rome— Commencement of the Conflict in Lower Italy

The Romans too were well aware of the conflict which awaited them. In order first of all to secure the fidelity of their allies or, in other words, of their subjects, the towns that could not be depended on were garrisoned, and the leaders of the party of independence, where it seemed needful, were arrested or executed: such was the case with a number of the members of the senate of Praeneste. For the war itself great exertions were made; a war contribution was levied; the full contingent was called forth from all their subjects and allies; even the proletarians who were properly exempt from obligation of service were called to arms. A Roman army remained as a reserve in the capital. A second advanced under the consul Tiberius Coruncanius into Etruria, and dispersed the forces of Volci and Volsinii. The main force was of course destined for Lower Italy; its departure was hastened as much as possible, in order to reach Pyrrhus while still in the territory

Page 359

of Tarentum, and to prevent him and his forces from forming a junction with the Samnites and other south Italian levies that were in arms against Rome. The Roman garrisons, that were placed in the Greek towns of Lower Italy, were intended temporarily to check the king's progress. But the mutiny of the troops stationed in Rhegium—one of the legions levied from the Campanian subjects of Rome under a Campanian captain Decius—deprived the Romans of that important town. It was not, however, transferred to the hands of Pyrrhus. While on the one hand the national hatred of the Campanians against the Romans undoubtedly contributed to produce this military insurrection, it was impossible on the other hand that Pyrrhus, who had crossed the sea to shield and protect the Hellenes, could receive as his allies troops who had put to death their Rhegine hosts in their own houses. Thus they remained isolated, in close league with their kinsmen and comrades in crime, the Mamertines, that is, the Campanian mercenaries of Agathocles, who had by similar means gained possession of Messana on the opposite side of the straits; and they pillaged and laid waste for their own behoof the adjacent Greek towns, such as Croton, where they put to death the Roman garrison, and Caulonia, which they destroyed. On the other hand the Romans succeeded, by means of a weak corps which advanced along the Lucanian frontier and of the garrison of Venusia, in preventing the Lucanians and Samnites from uniting with Pyrrhus; while the main force—four legions as it would appear, and so, with a corresponding number of allied troops, at least 50,000 strong—marched against Pyrrhus, under the consul Publius Laevinus.

Battle near Heraclea

With a view to cover the Tarentine colony of Heraclea, the king had taken up a position with his own and the Tarentine troops between that city and Pandosia (3) (474). The Romans, covered by their cavalry, forced the passage of the Siris, and opened the battle with a vehement and successful cavalry charge; the king, who led his cavalry in person, was thrown from his horse, and the Greek horsemen, panic-struck by the disappearance of their leader, abandoned the field to the squadrons of the enemy. Pyrrhus, however, put himself at the head of his infantry, and began a fresh and more decisive engagement. Seven times the legions and the phalanx met in shock of battle, and still the conflict was undecided. Then Megacles, one of the best officers of the king, fell, and, because on this hotly-contested day he had worn the king's armour, the army for the second time believed that the king had fallen; the ranks wavered; Laevinus already felt sure of the victory and threw the whole of his cavalry on the flank of the Greeks. But Pyrrhus, marching with uncovered head through the ranks of the infantry, revived the sinking courage of his troops. The elephants which had hitherto been kept in reserve were brought up to meet the cavalry; the horses took

Page 360

fright at them; the soldiers, not knowing how to encounter the huge beasts, turned and fled; the masses of disordered horsemen and the pursuing elephants at length broke the compact ranks of the Roman infantry, and the elephants in concert with the excellent Thessalian cavalry wrought great slaughter among the fugitives. Had not a brave Roman soldier, Gaius Minucius, the first hastate of the fourth legion, wounded one of the elephants and thereby thrown the pursuing troops into confusion, the Roman army would have been extirpated; as it was, the remainder of the Roman troops succeeded in retreating across the Siris. Their loss was great; 7000 Romans were found by the victors dead or wounded on the field of battle, 2000 were brought in prisoners; the Romans themselves stated their loss, including probably the wounded carried off the field, at 15,000 men. But Pyrrhus's army had suffered not much less: nearly 4000 of his best soldiers strewed the field of battle, and several of his ablest captains had fallen. Considering that his loss fell chiefly on the veteran soldiers who were far more difficult to be replaced than the Roman militia, and that he owed his victory only to the surprise produced by the attack of the elephants which could not be often repeated, the king, skilful judge of tactics as he was, may well at an after period have described this victory as resembling a defeat; although he was not so foolish as to communicate that piece of self-criticism to the public—as the Roman poets afterwards invented the story—in the inscription of the votive offering presented by him at Tarentum. Politically it mattered little in the first instance at what sacrifices the victory was bought; the gain of the first battle against the Romans was of inestimable value for Pyrrhus. His talents as a general had been brilliantly displayed on this new field of battle, and if anything could breathe unity and energy into the languishing league of the Italians, the victory of Heraclea could not fail to do so. But even the immediate results of the victory were considerable and lasting. Lucania was lost to the Romans: Laevinus collected the troops stationed there and marched to Apulia, The Bruttians, Lucanians, and Samnites joined Pyrrhus unmolested. With the exception of Rhegium, which pined under the oppression of the Campanian mutineers, the whole of the Greek cities joined the king, and Locri even voluntarily delivered up to him the Roman garrison; in his case they were persuaded, and with reason, that they would not be abandoned to the Italians. The Sabellians and Greeks thus passed over to Pyrrhus; but the victory produced no further effect. The Latins showed no inclination to get quit of the Roman rule, burdensome as it might be, by the help of a foreign dynast. Venusia, although now wholly surrounded by enemies, adhered with unshaken steadfastness to Rome. Pyrrhus proposed to the prisoners taken on the Siris, whose brave demeanour the chivalrous king requited by the most honourable treatment, that they should enter his army in accordance with the Greek fashion; but he learned that he was fighting not with mercenaries, but with a nation. Not one, either Roman or Latin, took service with him.

Page 361

Attempts at Peace

Pyrrhus offered peace to the Romans. He was too sagacious a soldier not to recognize the precariousness of his footing, and too skilled a statesman not to profit opportunely by the moment which placed him in the most favourable position for the conclusion of peace. He now hoped that under the first impression made by the great battle on the Romans he should be able to secure the freedom of the Greek towns in Italy, and to call into existence between them and Rome a series of states of the second and third order as dependent allies of the new Greek power; for such was the tenor of his demands: the release of all Greek towns—and therefore of the Campanian and Lucanian towns in particular—from allegiance to Rome, and restitution of the territory taken from the Samnites, Daunians, Lucanians, and Bruttians, or in other words especially the surrender of Luceria and Venusia. If a further struggle with Rome could hardly be avoided, it was not desirable at any rate to begin it till the western Hellenes should be united under one ruler, till Sicily should be acquired and perhaps Africa be conquered.

Provided with such instructions, the Thessalian Cineas, the confidential minister of Pyrrhus, went to Rome. That dexterous negotiator, whom his contemporaries compared to Demosthenes so far as a rhetorician might be compared to a statesman and the minister of a sovereign to a popular leader, had orders to display by every means the respect which the victor of Heraclea really felt for his vanquished opponents, to make known the wish of the king to come to Rome in person, to influence men's minds in the king's favour by panegyrics which sound so well in the mouth of an enemy, by earnest flatteries, and, as opportunity offered, also by well-timed gifts—in short to try upon the Romans all the arts of cabinet policy, as they had been tested at the courts of Alexandria and Antioch. The senate hesitated; to many it seemed a prudent course to draw back a step and to wait till their dangerous antagonist should have further entangled himself or should be no more. But the grey-haired and blind consular Appius Claudius (censor 442, consul 447, 458), who had long withdrawn from state affairs but had himself conducted at this decisive moment to the senate, breathed the unbroken energy of his own vehement nature with words of fire into the souls of the younger generation. They gave to the message of the king the proud reply, which was first heard on this occasion and became thenceforth a maxim of the state, that Rome never negotiated so long as there were foreign troops on Italian ground; and to make good their words they dismissed the ambassador at once from the city. The object of the mission had failed, and the dexterous diplomatist, instead of producing an effect by his oratorical art, had on the contrary been himself impressed by such manly earnestness after so severe a defeat—he declared at home that every burgess in that city had seemed to him a king; in truth, the courtier had gained a sight of a free people.

Page 362

Pyrrhus Marches against Rome

Pyrrhus, who during these negotiations had advanced into Campania, immediately on the news of their being broken off marched against Rome, to co-operate with the Etruscans, to shake the allies of Rome, and to threaten the city itself. But the Romans as little allowed themselves to be terrified as cajoled. At the summons of the herald "to enrol in the room of the fallen," the young men immediately after the battle of Heraclea had pressed forward in crowds to enlist; with the two newly-formed legions and the corps withdrawn from Lucania, Laevinus, stronger than before, followed the march of the king. He protected Capua against him, and frustrated his endeavours to enter into communications with Neapolis. So firm was the attitude of the Romans that, excepting the Greeks of Lower Italy, no allied state of any note dared to break off from the Roman alliance. Then Pyrrhus turned against Rome itself. Through a rich country, whose flourishing condition he beheld with astonishment, he marched against Fregellae which he surprised, forced the passage of the Liris, and reached Anagnia, which is not more than forty miles from Rome. No army crossed his path; but everywhere the towns of Latium closed their gates against him, and with measured step Laevinus followed him from Campania, while the consul Tiberius Coruncanius, who had just concluded a seasonable peace with the Etruscans, brought up a second Roman army from the north, and in Rome itself the reserve was preparing for battle under the dictator Gnaeus Domitius Calvinus. In these circumstances Pyrrhus could accomplish nothing; no course was left to him but to retire. For a time he still remained inactive in Campania in presence of the united armies of the two consuls; but no opportunity occurred of striking an effective blow. When winter came on, the king evacuated the enemy's territory, and distributed his troops among the friendly towns, taking up his own winter quarters in Tarentum. Thereupon the Romans also desisted from their operations. The army occupied standing quarters near Firmum in Picenum, where by command of the senate the legions defeated on the Siris spent the winter by way of punishment under tents.

Second Year of the War

Thus ended the campaign of 474. The separate peace which at the decisive moment Etruria had concluded with Rome, and the king's unexpected retreat which entirely disappointed the high-strung hopes of the Italian confederates, counterbalanced in great measure the impression of the victory of Heraclea. The Italians complained of the burdens of the war, particularly of the bad discipline of the mercenaries quartered among them, and the king, weary of the petty quarrelling and of the impolitic as well as unmilitary conduct of his allies, began to have a presentiment that the problem which had fallen to him might be, despite all tactical successes, politically insoluble. The arrival of a Roman embassy of three consulars,

Page 363

including Gaius Fabricius the conqueror of Thurii, again revived in him for a moment the hopes of peace; but it soon appeared that they had only power to treat for the ransom or exchange of prisoners. Pyrrhus rejected their demand, but at the festival of the Saturnalia he released all the prisoners on their word of honour. Their keeping of that word, and the repulse by the Roman ambassador of an attempt at bribery, were celebrated by posterity in a manner most unbecoming and betokening rather the dishonourable character of the later, than the honourable feeling of that earlier, epoch.

Battle of Ausculum

In the spring of 475 Pyrrhus resumed the offensive, and advanced into Apulia, whither the Roman army marched to meet him. In the hope of shaking the Roman symmarchy in these regions by a decisive victory, the king offered battle a second time, and the Romans did not refuse it. The two armies encountered each other near Ausculum (Ascoli di Puglia). Under the banners of Pyrrhus there fought, besides his Epirot and Macedonian troops, the Italian mercenaries, the burgess-force—the white shields as they were called—of Tarentum, and the allied Lucanians, Bruttians, and Samnites—altogether 70,000 infantry, of whom 16,000 were Greeks and Epirots, more than 8000 cavalry, and nineteen elephants. The Romans were supported on that day by the Latins, Campanians, Volscians, Sabines, Umbrians, Marrucinians, Paelignians, Frentanians, and Arpanians. They too numbered above 70,000 infantry, of whom 20,000 were Roman citizens, and 8000 cavalry. Both parties had made alterations in their military system. Pyrrhus, perceiving with the sharp eye of a soldier the advantages of the Roman manipular organization, had on the wings substituted for the long front of his phalanxes an arrangement by companies with intervals between them in imitation of the cohorts, and—perhaps for political no less than for military reasons—had placed the Tarentine and Samnite cohorts between the subdivisions of his own men. In the centre alone the Epirot phalanx stood in close order. For the purpose of keeping off the elephants the Romans produced a species of war-chariot, from which projected iron poles furnished with chafing-dishes, and on which were fastened moveable masts adjusted with a view to being lowered, and ending in an iron spike—in some degree the model of the boarding-bridges which were to play so great a part in the first Punic war.

According to the Greek account of the battle, which seems less one-sided than the Roman account also extant, the Greeks had the disadvantage on the first day, as they did not succeed in deploying their line along the steep and marshy banks of the river where they were compelled to accept battle, or in bringing their cavalry and elephants into action. On the second day, however, Pyrrhus anticipated the Romans in occupying the intersected ground, and thus gained without loss the plain where he could without disturbance draw

Page 364

up his phalanx. Vainly did the Romans with desperate courage fall sword in hand on the -sarissae-; the phalanx preserved an unshaken front under every assault, but in its turn was unable to make any impression on the Roman legions. It was not till the numerous escort of the elephants had, with arrows and stones hurled from slings, dislodged the combatants stationed in the Roman war-chariots and had cut the traces of the horses, and the elephants pressed upon the Roman line, that it began to waver. The giving way of the guard attached to the Roman chariots formed the signal for universal flight, which, however, did not involve the sacrifice of many lives, as the adjoining camp received the fugitives. The Roman account of the battle alone mentions the circumstance, that during the principal engagement an Arpanian corps detached from the Roman main force had attacked and set on fire the weakly-guarded Epirot camp; but, even if this were correct, the Romans are not at all justified in their assertion that the battle remained undecided. Both accounts, on the contrary, agree in stating that the Roman army retreated across the river, and that Pyrrhus remained in possession of the field of battle. The number of the fallen was, according to the Greek account, 6000 on the side of the Romans, 3505 on that of the Greeks.(4) Amongst the wounded was the king himself, whose arm had been pierced with a javelin, while he was fighting, as was his wont, in the thickest of the fray. Pyrrhus had achieved a victory, but his were unfruitful laurels; the victory was creditable to the king as a general and as a soldier, but it did not promote his political designs. What Pyrrhus needed was a brilliant success which should break up the Roman army and give an opportunity and impulse to the wavering allies to change sides; but the Roman army and the Roman confederacy still remained unbroken, and the Greek army, which was nothing without its leader, was fettered for a considerable time in consequence of his wound. He was obliged to renounce the campaign and to go into winter quarters; which the king took up in Tarentum, the Romans on this occasion in Apulia. It was becoming daily more evident that in a military point of view the resources of the king were inferior to those of the Romans, just as, politically, the loose and refractory coalition could not stand a comparison with the firmly-established Roman symmarchy. The sudden and vehement style of the Greek warfare and the genius of the general might perhaps achieve another such victory as those of Heraclea and Ausculum, but every new victory was wearing out his resources for further enterprise, and it was clear that the Romans already felt themselves the stronger, and awaited with a courageous patience final victory. Such a war as this was not the delicate game of art that was practised and understood by the Greek princes. All strategical combinations were shattered against the full and mighty energy of

Page 365

the national levy. Pyrrhus felt how matters stood: weary of his victories and despising his allies, he only persevered because military honour required him not to leave Italy till he should have secured his clients from barbarian assault. With his impatient temperament it might be presumed that he would embrace the first pretext to get rid of the burdensome duty; and an opportunity of withdrawing from Italy was soon presented to him by the affairs of Sicily.

Relations of Sicily, Syracuse, and Carthage— Pyrrhus Invited to Syracuse

After the death of Agathocles (465) the Greeks of Sicily were without any leading power. While in the several Hellenic cities incapable demagogues and incapable tyrants were replacing each other, the Carthaginians, the old rulers of the western point, were extending their dominion unmolested. After Agrigentum had surrendered to them, they believed that the time had come for taking final steps towards the end which they had kept in view for centuries, and for reducing the whole island under their authority; they set themselves to attack Syracuse. That city, which formerly by its armies and fleets had disputed the possession of the island with Carthage, had through internal dissension and the weakness of its government fallen so low that it was obliged to seek for safety in the protection of its walls and in foreign aid; and none could afford that aid but king Pyrrhus. Pyrrhus was the husband of Agathocles's daughter, and his son Alexander, then sixteen years of age, was Agathocles's grandson. Both were in every respect natural heirs of the ambitious schemes of the ruler of Syracuse; and if her freedom was at an end, Syracuse might find compensation in becoming the capital of a Hellenic empire of the West. So the Syracusans, like the Tarentines, and under similar conditions, voluntarily offered their sovereignty to king Pyrrhus (about 475); and by a singular conjuncture of affairs everything seemed to concur towards the success of the magnificent plans of the Epirot king, based as they primarily were on the possession of Tarentum and Syracuse.

League between Rome and Carthage— Third Year of the War

The immediate effect, indeed, of this union of the Italian and Sicilian Greeks under one control was a closer concert also on the part of their antagonists. Carthage and Rome now converted their old commercial treaties into an offensive and defensive league against Pyrrhus (475), the tenor of which was that, if Pyrrhus invaded Roman or Carthaginian territory, the party which was not attacked should furnish that which was assailed with a contingent on its own territory and should itself defray the expense of the auxiliary troops; that in such an event Carthage should be bound to furnish transports and to assist the Romans also with a war fleet, but the crews of that fleet should not be

obliged to fight for the Romans by land; that lastly, both states should pledge themselves not to conclude

Page 366

a separate peace with Pyrrhus. The object of the Romans in entering into the treaty was to render possible an attack on Tarentum and to cut off Pyrrhus from his own country, neither of which ends could be attained without the co-operation of the Punic fleet; the object of the Carthaginians was to detain the king in Italy, so that they might be able without molestation to carry into effect their designs on Syracuse.(5) It was accordingly the interest of both powers in the first instance to secure the sea between Italy and Sicily. A powerful Carthaginian fleet of 120 sail under the admiral Mago proceeded from Ostia, whither Mago seems to have gone to conclude the treaty, to the Sicilian straits. The Mamertines, who anticipated righteous punishment for their outrage upon the Greek population of Messana in the event of Pyrrhus becoming ruler of Sicily and Italy, attached themselves closely to the Romans and Carthaginians, and secured for them the Sicilian side of the straits. The allies would willingly have brought Rhegium also on the opposite coast under their power; but Rome could not possibly pardon the Campanian garrison, and an attempt of the combined Romans and Carthaginians to gain the city by force of arms miscarried. The Carthaginian fleet sailed thence for Syracuse and blockaded the city by sea, while at the same time a strong Phoenician army began the siege by land (476). It was high time that Pyrrhus should appear at Syracuse: but, in fact, matters in Italy were by no means in such a condition that he and his troops could be dispensed with there. The two consuls of 476, Gaius Fabricius Luscinus, and Quintus Aemilius Papus, both experienced generals, had begun the new campaign with vigour, and although the Romans had hitherto sustained nothing but defeat in this war, it was not they but the victors that were weary of it and longed for peace. Pyrrhus made another attempt to obtain accommodation on tolerable terms. The consul Fabricius had handed over to the king a wretch, who had proposed to poison him on condition of being well paid for it. Not only did the king in token of gratitude release all his Roman prisoners without ransom, but he felt himself so moved by the generosity of his brave opponents that he offered, by way of personal recompense, a singularly fair and favourable peace. Cineas appears to have gone once more to Rome, and Carthage seems to have been seriously apprehensive that Rome might come to terms. But the senate remained firm, and repeated its former answer. Unless the king was willing to allow Syracuse to fall into the hands of the Carthaginians and to have his grand scheme thereby disconcerted, no other course remained than to abandon his Italian allies and to confine himself for the time being to the occupation of the most important seaports, particularly Tarentum and Locri. In vain the Lucanians and Samnites conjured him not to desert them; in vain the Tarentines summoned him either to comply with his duty as their general or to give them back their city. The king met their complaints and reproaches with the consolatory assurance that better times were coming, or with abrupt dismissal. Milo remained behind in Tarentum; Alexander, the king's son, in Locri; and Pyrrhus, with his main force, embarked in the spring of 476 at Tarentum for Syracuse.

Page 367

Embarkation of Pyrrhus for Sicily— The War in Italy Flags

By the departure of Pyrrhus the hands of the Romans were set free in Italy; none ventured to oppose them in the open field, and their antagonists everywhere confined themselves to their fastnesses or their forests. The struggle however was not terminated so rapidly as might have been expected; partly in consequence of its nature as a warfare of mountain skirmishes and sieges, partly also, doubtless, from the exhaustion of the Romans, whose fearful losses are indicated by a decrease of 17,000 in the burgess-roll from 473 to 479. In 476 the consul Gaius Fabricius succeeded in inducing the considerable Tarentine settlement of Heraclea to enter into a separate peace, which was granted to it on the most favourable terms. In the campaign of 477 a desultory warfare was carried on in Samnium, where an attack thoughtlessly made on some entrenched heights cost the Romans many lives, and thereafter in southern Italy, where the Lucanians and Bruttians were defeated. On the other hand Milo, issuing from Tarentum, anticipated the Romans in their attempt to surprise Croton: whereupon the Epirot garrison made even a successful sortie against the besieging army. At length, however, the consul succeeded by a stratagem in inducing it to march forth, and in possessing himself of the undefended town (477). An incident of more moment was the slaughter of the Epirot garrison by the Locrians, who had formerly surrendered the Roman garrison to the king, and now atoned for one act of treachery by another. By that step the whole south coast came into the hands of the Romans, with the exception of Rhegium and Tarentum. These successes, however, advanced the main object but little. Lower Italy itself had long been defenceless; but Pyrrhus was not subdued so long as Tarentum remained in his hands and thus rendered it possible for him to renew the war at his pleasure, and the Romans could not think of undertaking the siege of that city. Even apart from the fact that in siege-warfare, which had been revolutionized by Philip of Macedonia and Demetrius Poliorcetes, the Romans were at a very decided disadvantage when matched against an experienced and resolute Greek commandant, a strong fleet was needed for such an enterprise, and, although the Carthaginian treaty promised to the Romans support by sea, the affairs of Carthage herself in Sicily were by no means in such a condition as to enable her to grant that support.

Pyrrhus Master of Sicily

The landing of Pyrrhus on the island, which, in spite of the Carthaginian fleet, had taken place without interruption, had changed at once the aspect of matters there. He had immediately relieved Syracuse, had in a short time united under his sway all the free Greek cities, and at the head of the Sicilian confederation had wrested from the Carthaginians nearly their whole possessions. It was with difficulty that the Carthaginians could, by the help of their fleet which

Page 368

at that time ruled the Mediterranean without a rival, maintain themselves in Lilybaeum; it was with difficulty, and amidst constant assaults, that the Mamertines held their ground in Messana. Under such circumstances, agreeably to the treaty of 475, it would have been the duty of Rome to lend her aid to the Carthaginians in Sicily, far rather than that of Carthage to help the Romans with her fleet to conquer Tarentum; but on the side of neither ally was there much inclination to secure or to extend the power of the other. Carthage had only offered help to the Romans when the real danger was past; they in their turn had done nothing to prevent the departure of the king from Italy and the fall of the Carthaginian power in Sicily. Indeed, in open violation of the treaties Carthage had even proposed to the king a separate peace, offering, in return for the undisturbed possession of Lilybaeum, to give up all claim to her other Sicilian possessions and even to place at the disposal of the king money and ships of war, of course with a view to his crossing to Italy and renewing the war against Rome. It was evident, however, that with the possession of Lilybaeum and the departure of the king the position of the Carthaginians in the island would be nearly the same as it had been before the landing of Pyrrhus; the Greek cities if left to themselves were powerless, and the lost territory would be easily regained. So Pyrrhus rejected the doubly perfidious proposal, and proceeded to build for himself a war fleet. Mere ignorance and shortsightedness in after times censured this step; but it was really as necessary as it was, with the resources of the island, easy of accomplishment. Apart from the consideration that the master of Ambracia, Tarentum, and Syracuse could not dispense with a naval force, he needed a fleet to conquer Lilybaeum, to protect Tarentum, and to attack Carthage at home as Agathocles, Regulus, and Scipio did before or afterwards so successfully. Pyrrhus never was so near to the attainment of his aim as in the summer of 478, when he saw Carthage humbled before him, commanded Sicily, and retained a firm footing in Italy by the possession of Tarentum, and when the newly-created fleet, which was to connect, to secure, and to augment these successes, lay ready for sea in the harbour of Syracuse.

The Sicilian Government of Pyrrhus

The real weakness of the position of Pyrrhus lay in his faulty internal policy. He governed Sicily as he had seen Ptolemy rule in Egypt: he showed no respect to the local constitutions; he placed his confidants as magistrates over the cities whenever, and for as long as, he pleased; he made his courtiers judges instead of the native jurymen; he pronounced arbitrary sentences of confiscation, banishment, or death, even against those who had been most active in promoting his coming thither; he placed garrisons in the towns, and ruled over Sicily not as the leader of a national league, but as a king. In so doing

Page 369

he probably reckoned himself according to oriental-Hellenistic ideas a good and wise ruler, and perhaps he really was so; but the Greeks bore this transplantation of the system of the Diadochi to Syracuse with all the impatience of a nation that in its long struggle for freedom had lost all habits of discipline; the Carthaginian yoke very soon appeared to the foolish people more tolerable than their new military government. The most important cities entered into communications with the Carthaginians, and even with the Mamertines; a strong Carthaginian army ventured again to appear on the island; and everywhere supported by the Greeks, it made rapid progress. In the battle which Pyrrhus fought with it fortune was, as always, with the "Eagle"; but the circumstances served to show what the state of feeling was in the island, and what might and must ensue, if the king should depart.

Departure of Pyrrhus to Italy

To this first and most essential error Pyrrhus added a second; he proceeded with his fleet, not to Lilybaeum, but to Tarentum. It was evident, looking to the very ferment in the minds of the Sicilians, that he ought first of all to have dislodged the Carthaginians wholly from the island, and thereby to have cut off the discontented from their last support, before he turned his attention to Italy; in that quarter there was nothing to be lost, for Tarentum was safe enough for him, and the other allies were of little moment now that they had been abandoned. It is conceivable that his soldierly spirit impelled him to wipe off the stain of his not very honourable departure in the year 476 by a brilliant return, and that his heart bled when he heard the complaints of the Lucanians and Samnites. But problems, such as Pyrrhus had proposed to himself, can only be solved by men of iron nature, who are able to control their feelings of compassion and even their sense of honour; and Pyrrhus was not one of these.

Fall of the Sicilian Kingdom— Recommencement of the Italian War

The fatal embarkation took place towards the end of 478. On the voyage the new Syracusan fleet had to sustain a sharp engagement with that of Carthage, in which it lost a considerable number of vessels. The departure of the king and the accounts of this first misfortune sufficed for the fall of the Sicilian kingdom. On the arrival of the news all the cities refused to the absent king money and troops; and the brilliant state collapsed even more rapidly than it had arisen, partly because the king had himself undermined in the hearts of his subjects the loyalty and affection on which every commonwealth depends, partly because the people lacked the devotedness to renounce freedom for perhaps but a short term in order to save their nationality. Thus the enterprise of Pyrrhus was wrecked, and the plan of his life was ruined irretrievably; he was thenceforth an adventurer, who felt that he had been great and was so no longer,

Page 370

and who now waged war no longer as a means to an end, but in order to drown thought amidst the reckless excitement of the game and to find, if possible, in the tumult of battle a soldier's death. Arrived on the Italian coast, the king began by an attempt to get possession of Rhegium; but the Campanians repulsed the attack with the aid of the Mamertines, and in the heat of the conflict before the town the king himself was wounded in the act of striking down an officer of the enemy. On the other hand he surprised Locri, whose inhabitants suffered severely for their slaughter of the Epirot garrison, and he plundered the rich treasury of the temple of Persephone there, to replenish his empty exchequer. Thus he arrived at Tarentum, it is said with 20,000 infantry and 3000 cavalry. But these were no longer the experienced veterans of former days, and the Italians no longer hailed them as deliverers; the confidence and hope with which they had received the king five years before were gone; the allies were destitute of money and of men.

Battle near Beneventum—
Pyrrhus Leaves Italy—
Death of Pyrrhus

The king took the field in the spring of 479 with the view of aiding the hard-pressed Samnites, in whose territory the Romans had passed the previous winter; and he forced the consul Manius Curius to give battle near Beneventum on the -campus Arusinus-, before he could form a junction with his colleague advancing from Lucania. But the division of the army, which was intended to take the Romans in flank, lost its way during its night march in the woods, and failed to appear at the decisive moment; and after a hot conflict the elephants again decided the battle, but decided it this time in favour of the Romans, for, thrown into confusion by the archers who were stationed to protect the camp, they attacked their own people. The victors occupied the camp; there fell into their hands 1300 prisoners and four elephants—the first that were seen in Rome—besides an immense spoil, from the proceeds of which the aqueduct, which conveyed the water of the Anio from Tibur to Rome, was subsequently built. Without troops to keep the field and without money, Pyrrhus applied to his allies who had contributed to his equipment for Italy, the kings of Macedonia and Asia; but even in his native land he was no longer feared, and his request was refused. Despairing of success against Rome and exasperated by these refusals, Pyrrhus left a garrison in Tarentum, and went home himself in the same year (479) to Greece, where some prospect of gain might open up to the desperate player sooner than amidst the steady and measured course of Italian affairs. In fact, he not only rapidly recovered the portion of his kingdom that had been taken away, but once more grasped, and not without success, at the Macedonian throne. But his last plans also were thwarted by the calm and cautious policy of Antigonus Gonatas, and still more by his own vehemence and inability to tame his proud spirit; he still gained battles, but he no longer gained any lasting success, and met his death in a miserable street combat in Peloponnesian Argos (482).

Page 371

Last Struggles in Italy— Capture of Tarentum

In Italy the war came to an end with the battle of Beneventum; the last convulsive struggles of the national party died slowly away. So long indeed as the warrior prince, whose mighty arm had ventured to seize the reins of destiny in Italy, was still among the living, he held, even when absent, the stronghold of Tarentum against Rome. Although after the departure of the king the peace party recovered ascendancy in the city, Milo, who commanded there on behalf of Pyrrhus, rejected their suggestions and allowed the citizens favourable to Rome, who had erected a separate fort for themselves in the territory of Tarentum, to conclude peace with Rome as they pleased, without on that account opening his gates. But when after the death of Pyrrhus a Carthaginian fleet entered the harbour, and Milo saw that the citizens were on the point of delivering up the city to the Carthaginians, he preferred to hand over the citadel to the Roman consul Lucius Papirius (482), and by that means to secure a free departure for himself and his troops. For the Romans this was an immense piece of good fortune. After the experiences of Philip before Perinthus and Byzantium, of Demetrius before Rhodes, and of Pyrrhus before Lilybaeum, it may be doubted whether the strategy of that period was at all able to compel the surrender of a town well fortified, well defended, and freely accessible by sea; and how different a turn matters might have taken, had Tarentum become to the Phoenicians in Italy what Lilybaeum was to them in Sicily! What was done, however, could not be undone. The Carthaginian admiral, when he saw the citadel in the hands of the Romans, declared that he had only appeared before Tarentum conformably to the treaty to lend assistance to his allies in the siege of the town, and set sail for Africa; and the Roman embassy, which was sent to Carthage to demand explanations and make complaints regarding the attempted occupation of Tarentum, brought back nothing but a solemn confirmation on oath of that allegation as to its ally's friendly design, with which accordingly the Romans had for the time to rest content. The Tarentines obtained from Rome, presumably on the intercession of their emigrants, the restoration of autonomy; but their arms and ships had to be given up and their walls had to be pulled down.

Submission of Lower Italy

In the same year, in which Tarentum became Roman, the Samnites, Lucanians, and Bruttians finally submitted. The latter were obliged to cede the half of the lucrative, and for ship-building important, forest of Sila.

Page 372

At length also the band that for ten years had sheltered themselves in Rhegium were duly chastised for the breach of their military oath, as well as for the murder of the citizens of Rhegium and of the garrison of Croton. In this instance Rome, while vindicating her own rights vindicated the general cause of the Hellenes against the barbarians. Hiero, the new ruler of Syracuse, accordingly supported the Romans before Rhegium by sending supplies and a contingent, and in combination with the Roman expedition against the garrison of Rhegium he made an attack upon their fellow-countrymen and fellow-criminals, the Mamertines of Messana. The siege of the latter town was long protracted. On the other hand Rhegium, although the mutineers resisted long and obstinately, was stormed by the Romans in 484; the survivors of the garrison were scourged and beheaded in the public market at Rome, while the old inhabitants were recalled and, as far as possible, reinstated in their possessions. Thus all Italy was, in 484, reduced to subjection. The Samnites alone, the most obstinate antagonists of Rome, still in spite of the official conclusion of peace continued the struggle as “robbers,” so that in 485 both consuls had to be once more despatched against them. But even the most high-spirited national courage—the bravery of despair—comes to an end; the sword and the gibbet at length carried quiet even into the mountains of Samnium.

Construction of New Fortresses and Roads

For the securing of these immense acquisitions a new series of colonies was instituted: Paestum and Cosa in Lucania (481); Beneventum (486), and Aesernia (about 491) to hold Samnium in check; and, as outposts against the Gauls, Ariminum (486), Firmum in Picenum (about 490), and the burgess colony of Castrum Novum. Preparations were made for the continuation of the great southern highway—which acquired in the fortress of Beneventum a new station intermediate between Capua and Venusia—as far as the seaports of Tarentum and Brundisium, and for the colonization of the latter seaport, which Roman policy had selected as the rival and successor of the Tarentine emporium. The construction of the new fortresses and roads gave rise to some further wars with the small tribes, whose territory was thereby curtailed: with the Picentes (485, 486), a number of whom were transplanted to the district of Salernum; with the Sallentines about Brundisium (487, 488); and with the Umbrian Sassinates (487, 488), who seem to have occupied the territory of Ariminum after the expulsion of the Senones. By these establishments the dominion of Rome was extended over the interior of Lower Italy, and over the whole Italian east coast from the Ionian sea to the Celtic frontier.

Maritime Relations

Page 373

Before we describe the political organization under which the Italy which was thus united was governed on the part of Rome, it remains that we should glance at the maritime relations that subsisted in the fourth and fifth centuries. At this period Syracuse and Carthage were the main competitors for the dominion of the western waters. On the whole, notwithstanding the great temporary successes which Dionysius (348-389), Agathocles (437-465), and Pyrrhus (476-478) obtained at sea, Carthage had the preponderance and Syracuse sank more and more into a naval power of the second rank. The maritime importance of Etruria was wholly gone;(6) the hitherto Etruscan island of Corsica, if it did not quite pass into the possession, fell under the maritime supremacy, of the Carthaginians. Tarentum, which for a time had played a considerable part, had its power broken by the Roman occupation. The brave Massiliots maintained their ground in their own waters; but they exercised no material influence over the course of events in those of Italy. The other maritime cities hardly came as yet into serious account.

Decline of the Roman Naval Power

Rome itself was not exempt from a similar fate; its own waters were likewise commanded by foreign fleets. It was indeed from the first a maritime city, and in the period of its vigour never was so untrue to its ancient traditions as wholly to neglect its war marine or so foolish as to desire to be a mere continental power. Latium furnished the finest timber for ship-building, far surpassing the famed growths of Lower Italy; and the very docks constantly maintained in Rome are enough to show that the Romans never abandoned the idea of possessing a fleet of their own. During the perilous crises, however, which the expulsion of the kings, the internal disturbances in the Romano-Latin confederacy, and the unhappy wars with the Etruscans and Celts brought upon Rome, the Romans could take but little interest in the state of matters in the Mediterranean; and, in consequence of the policy of Rome directing itself more and more decidedly to the subjugation of the Italian continent, the growth of its naval power was arrested. There is hardly any mention of Latin vessels of war up to the end of the fourth century, except that the votive offering from the Veientine spoil was sent to Delphi in a Roman vessel (360). The Antiates indeed continued to prosecute their commerce with armed vessels and thus, as occasion offered, to practise the trade of piracy also, and the "Tyrrhene corsair" Postumius, whom Timoleon captured about 415, may certainly have been an Antiate; but the Antiates were scarcely to be reckoned among the naval powers of that period, and, had they been so, the fact must from the attitude of Antium towards Rome have been anything but an advantage to the latter. The extent to which the Roman naval power had declined about the year 400 is shown by the plundering of the Latin coasts by a Greek,

Page 374

presumably a Sicilian, war fleet in 405, while at the same time Celtic hordes were traversing and devastating the Latin land.(7) In the following year (406), and beyond doubt under the immediate impression produced by these serious events, the Roman community and the Phoenicians of Carthage, acting respectively for themselves and for their dependent allies, concluded a treaty of commerce and navigation—the oldest Roman document of which the text has reached us, although only in a Greek translation.(8) In that treaty the Romans had to come under obligation not to navigate the Libyan coast to the west of the Fair Promontory (Cape Bon) excepting in cases of necessity. On the other hand they obtained the privilege of freely trading, like the natives, in Sicily, so far as it was Carthaginian; and in Africa and Sardinia they obtained at least the right to dispose of their merchandise at a price fixed with the concurrence of the Carthaginian officials and guaranteed by the Carthaginian community. The privilege of free trading seems to have been granted to the Carthaginians at least in Rome, perhaps in all Latium; only they bound themselves neither to do violence to the subject Latin communities,(9) nor, if they should set foot as enemies on Latin soil, to take up their quarters for a night on shore—in other words, not to extend their piratical inroads into the interior—nor to construct any fortresses in the Latin land.

We may probably assign to the same period the already mentioned(10) treaty between Rome and Tarentum, respecting the date of which we are only told that it was concluded a considerable time before 472. By it the Romans bound themselves—for what concessions on the part of Tarentum is not stated—not to navigate the waters to the east of the Lacinian promontory; a stipulation by which they were thus wholly excluded from the eastern basin of the Mediterranean.

Roman Fortification of the Coast

These were disasters no less than the defeat on the Allia, and the Roman senate seems to have felt them as such and to have made use of the favourable turn, which the Italian relations assumed soon after the conclusion of the humiliating treaties with Carthage and Tarentum, with all energy to improve its depressed maritime position. The most important of the coast towns were furnished with Roman colonies: Pyrgi the seaport of Caere, the colonization of which probably falls within this period; along the west coast, Antium in 415,(11) Tarracina in 425,(12) the island of Pontia in 441,(13) so that, as Ardea and Circeii had previously received colonists, all the Latin seaports of consequence in the territory of the Rutuli and Volsci had now become Latin or burgess colonies; further, in the territory of the Aurunci, Minturnae and Sinuessa in 459;(14) in that of the Lucanians, Paestum and Cosa in 481;(15) and, on the coast of the Adriatic, Sena Gallica and Castrum Novum about 471,(16) and Ariminum in 486;(17) to which falls to

Page 375

be added the occupation of Brundisium, which took place immediately after the close of the Pyrrhic war. In the greater part of these places—the burgess or maritime colonies(18)—the young men were exempted from serving in the legions and destined solely for the watching of the coasts. The well judged preference given at the same time to the Greeks of Lower Italy over their Sabellian neighbours, particularly to the considerable communities of Neapolis, Rhegium, Locri, Thurii, and Heraclea, and their similar exemption under the like conditions from furnishing contingents to the land army, completed the network drawn by Rome around the coasts of Italy.

But with a statesmanlike sagacity, from which the succeeding generations might have drawn a lesson, the leading men of the Roman commonwealth perceived that all these coast fortifications and coast garrisons could not but prove inadequate, unless the war marine of the state were again placed on a footing that should command respect. Some sort of nucleus for this purpose was already furnished on the subjugation of Antium (416) by the serviceable war-galleys which were carried off to the Roman docks; but the enactment at the same time, that the Antiates should abstain from all maritime traffic,(19) is a very clear and distinct indication how weak the Romans then felt themselves at sea, and how completely their maritime policy was still summed up in the occupation of places on the coast. Thereafter, when the Greek cities of southern Italy, Neapolis leading the way in 428, were admitted to the clientship of Rome, the war-vessels, which each of these cities bound itself to furnish as a war contribution under the alliance to the Romans, formed at least a renewed nucleus for a Roman fleet. In 443, moreover, two fleet-masters (-duoviri navales-) were nominated in consequence of a resolution of the burgesses specially passed to that effect, and this Roman naval force co-operated in the Samnite war at the siege of Nuceria.(20) Perhaps even the remarkable mission of a Roman fleet of twenty-five sail to found a colony in Corsica, which Theophrastus mentions in his "History of Plants" written about 446, belongs to this period. But how little was immediately accomplished with all this preparation, is shown by the renewed treaty with Carthage in 448. While the stipulations of the treaty of 406 relating to Italy and Sicily(21) remained unchanged, the Romans were now prohibited not only from the navigation of the eastern waters, but also from that of the Atlantic Ocean which was previously permitted, as well as debarred from holding commercial intercourse with the subjects of Carthage in Sardinia and Africa, and also, in all probability, from effecting a settlement in Corsica;(22) so that only Carthaginian Sicily and Carthage itself remained open to their traffic. We recognize here the jealousy of the dominant maritime power, gradually increasing with the extension of the Roman dominion along the coasts. Carthage compelled

Page 376

the Romans to acquiesce in her prohibitive system, to submit to be excluded from the seats of production in the west and east (connected with which exclusion is the story of a public reward bestowed on the Phoenician mariner who at the sacrifice of his own ship decoyed a Roman vessel, steering after him into the Atlantic Ocean, to perish on a sand-bank), and to restrict their navigation under the treaty to the narrow space of the western Mediterranean—and all this for the mere purpose of averting pillage from their coasts and of securing their ancient and important trading connection with Sicily. The Romans were obliged to yield to these terms; but they did not desist from their efforts to rescue their marine from its condition of impotence.

Quaestors of the Fleet— Variance between Rome and Carthage

A comprehensive measure with that view was the institution of four quaestors of the fleet (-quaestores classici-) in 487: of whom the first was stationed at Ostia the port of Rome; the second, stationed at Cales then the capital of Roman Campania, had to superintend the ports of Campania and Magna Graecia; the third, stationed at Ariminum, superintended the ports on the other side of the Apennines; the district assigned to the fourth is not known. These new standing officials were intended to exercise not the sole, but a conjoint, guardianship of the coasts, and to form a war marine for their protection. The objects of the Roman senate—to recover their independence by sea, to cut off the maritime communications of Tarentum, to close the Adriatic against fleets coming from Epirus, and to emancipate themselves from Carthaginian supremacy—were very obvious. Their already explained relations with Carthage during the last Italian war discover traces of such views. King Pyrrhus indeed compelled the two great cities once more—it was for the last time—to conclude an offensive alliance; but the lukewarmness and faithlessness of that alliance, the attempts of the Carthaginians to establish themselves in Rhegium and Tarentum, and the immediate occupation of Brundisium by the Romans after the termination of the war, show clearly how much their respective interests already came into collision.

Rome and the Greek Naval Powers

Rome very naturally sought to find support against Carthage from the Hellenic maritime states. Her old and close relations of amity with Massilia continued uninterrupted. The votive offering sent by Rome to Delphi, after the conquest of Veii, was preserved there in the treasury of the Massiliots. After the capture of Rome by the Celts there was a collection in Massilia for the sufferers by the fire, in which the city chest took the lead; in return the Roman senate granted commercial advantages to the Massiliot merchants, and, at the celebration of the games in the Forum assigned a position of honour (-Graecostasis-) to the Massiliots by the side of the platform for the senators. To the same category belong the treaties of commerce and amity concluded by the Romans

about 448 with Rhodes and not long after with Apollonia, a considerable mercantile town on the Epirot coast, and especially the closer relation, so fraught with danger for Carthage, which immediately after the end of the Pyrrhic war sprang up between Rome and Syracuse.(23)

Page 377

While the Roman power by sea was thus very far from keeping pace with the immense development of their power by land, and the war marine belonging to the Romans in particular was by no means such as from the geographical and commercial position of the city it ought to have been, yet it began gradually to emerge out of the complete nullity to which it had been reduced about the year 400; and, considering the great resources of Italy, the Phoenicians might well follow its efforts with anxious eyes.

The crisis in reference to the supremacy of the Italian waters was approaching; by land the contest was decided. For the first time Italy was united into one state under the sovereignty of the Roman community. What political prerogatives the Roman community on this occasion withdrew from all the other Italian communities and took into its own sole keeping, or in other words, what conception in state-law is to be associated with this sovereignty of Rome, we are nowhere expressly informed, and—a significant circumstance, indicating prudent calculation—there does not even exist any generally current expression for that conception.(24) The only privileges that demonstrably belonged to it were the rights of making war, of concluding treaties, and of coining money. No Italian community could declare war against any foreign state, or even negotiate with it, or coin money for circulation. On the other hand every declaration of war made by the Roman people and every state-treaty resolved upon by it were binding in law on all the other Italian communities, and the silver money of Rome was legally current throughout all Italy. It is probable that the formulated prerogatives of the leading community extended no further. But to these there were necessarily attached rights of sovereignty that practically went far beyond them.

The Full Roman Franchise

The relations, which the Italians sustained to the leading community, exhibited in detail great inequalities. In this point of view, in addition to the full burgesses of Rome, there were three different classes of subjects to be distinguished. The full franchise itself, in the first place, was extended as far as was possible, without wholly abandoning the idea of an urban commonwealth as applied to the Roman commune. The old burgess-domain had hitherto been enlarged chiefly by individual assignation in such a way that southern Etruria as far as towards Caere and Falerii,(25) the districts taken from the Hernici on the Sacco and on the Anio(26) the largest part of the Sabine country(27) and large tracts of the territory formerly Volscian, especially the Pomptine plain(28) were converted into land for Roman farmers, and new burgess-districts were instituted mostly for their inhabitants. The same course had even already been taken with the Falernian district on the Volturnus ceded by Capua.(29) All these burgesses domiciled outside of Rome were without a commonwealth and an

Page 378

administration of their own; on the assigned territory there arose at the most market-villages (-fora et conciliabula-). In a position not greatly different were placed the burgesses sent out to the so-called maritime colonies mentioned above, who were likewise left in possession of the full burgess-rights of Rome, and whose self-administration was of little moment. Towards the close of this period the Roman community appears to have begun to grant full burgess-rights to the adjoining communities of passive burgesses who were of like or closely kindred nationality; this was probably done first for Tusculum,(30) and so, presumably, also for the other communities of passive burgesses in Latium proper, then at the end of this period (486) was extended to the Sabine towns, which doubtless were even then essentially Latinized and had given sufficient proof of their fidelity in the last severe war. These towns retained the restricted self-administration, which under their earlier legal position belonged to them, even after their admission into the Roman burgess-union; it was they more than the maritime colonies that furnished the model for the special commonwealths subsisting within the body of Roman full burgesses and so, in the course of time, for the Roman municipal organization. Accordingly the range of the full Roman burgesses must at the end of this epoch have extended northward as far as the vicinity of Caere, eastward as far as the Apennines, and southward as far as Tarracina; although in this case indeed we cannot speak of boundary in a strict sense, partly because a number of federal towns with Latin rights, such as Tibur, Praeneste, Signia, Norba, Circeii, were found within these bounds, partly because beyond them the inhabitants of Minturnae, Sinuessa, of the Falernian territory, of the town Sena Gallica and some other townships, likewise possessed the full franchise, and families of Roman farmers were presumably to be even now found scattered throughout Italy, either isolated or united in villages.

Subject Communities

Among the subject communities the passive burgesses (-cives sine suffragio-) apart from the privilege of electing and being elected, stood on an equality of rights and duties with the full burgesses. Their legal position was regulated by the decrees of the Roman comitia and the rules issued for them by the Roman praetor, which, however, were doubtless based essentially on the previous arrangements. Justice was administered for them by the Roman praetor or his deputies (-praefecti-) annually sent to the individual communities. Those of them in a better position, such as the city of Capua, (31) retained self-administration and along with it the continued use of the native language, and had officials of their own who took charge of the levy and the census. The communities of inferior rights such as Caere(32) were deprived even of self-administration, and this was doubtless the most oppressive among the different forms of subjection. However, as was above remarked, there is already apparent at the close of this period an effort to incorporate these communities, at least so far as they were -de facto- Latinized, among the full burgesses.

Page 379

Latins

Among the subject communities the most privileged and most important class was that of the Latin towns, which obtained accessions equally numerous and important in the autonomous communities founded by Rome within and even beyond Italy—the Latin colonies, as they were called—and was always increasing in consequence of new settlements of the same nature. These new urban communities of Roman origin, but with Latin rights, became more and more the real buttresses of the Roman rule over Italy. These Latins, however, were by no means those with whom the battles of the lake Regillus and Trifanum had been fought. They were not those old members of the Alban league, who reckoned themselves originally equal to, if not better than, the community of Rome, and who felt the dominion of Rome to be an oppressive yoke, as the fearfully rigorous measures of security taken against Praeneste at the beginning of the war with Pyrrhus, and the collisions that evidently long continued to occur with the Praenestines in particular, show. This old Latium had essentially either perished or become merged in Rome, and it now numbered but few communities politically self-subsisting, and these, with the exception of Tibur and Praeneste, throughout insignificant. The Latium of the later times of the republic, on the contrary, consisted almost exclusively of communities, which from the beginning had honoured Rome as their capital and parent city; which, settled amidst regions of alien language and of alien habits, were attached to Rome by community of language, of law, and of manners; which, as the petty tyrants of the surrounding districts, were obliged doubtless to lean on Rome for their very existence, like advanced posts leaning upon the main army; and which, in fine, in consequence of the increasing material advantages of Roman citizenship, were ever deriving very considerable benefit from their equality of rights with the Romans, limited though it was. A portion of the Roman domain, for instance, was usually assigned to them for their separate use, and participation in the state leases and contracts was open to them as to the Roman burgess. Certainly in their case also the consequences of the self-subsistence granted to them did not wholly fail to appear. Venusian inscriptions of the time of the Roman republic, and Beneventane inscriptions recently brought to light,(33) show that Venusia as well as Rome had its plebs and its tribunes of the people, and that the chief magistrates of Beneventum bore the title of consul at least about the time of the Hannibalic war. Both communities are among the most recent of the Latin colonies with older rights: we perceive what pretensions were stirring in them about the middle of the fifth century. These so-called Latins, issuing from the Roman burgess-body and feeling themselves in every respect on a level with it, already began to view with displeasure their subordinate federal rights and to strive after full

Page 380

equalization. Accordingly the senate had exerted itself to curtail these Latin communities—however important they were for Rome—as far as possible, in their rights and privileges, and to convert their position from that of allies to that of subjects, so far as this could be done without removing the wall of partition between them and the non-Latin communities of Italy. We have already described the abolition of the league of the Latin communities itself as well as of their former complete equality of rights, and the loss of the most important political privileges belonging to them. On the complete subjugation of Italy a further step was taken, and a beginning was made towards the restriction of the personal rights—that had not hitherto been touched—of the individual Latin, especially the important right of freedom of settlement. In the case of Ariminum founded in 486 and of all the autonomous communities constituted afterwards, the advantage enjoyed by them, as compared with other subjects, was restricted to their equalization with burgesses of the Roman community so far as regarded private rights—those of traffic and barter as well as those of inheritance.⁽³⁴⁾ Presumably about the same time the full right of free migration allowed to the Latin communities hitherto established—the title of every one of their burgesses to gain by transmigration to Rome full burgess-rights there—was, for the Latin colonies of later erection, restricted to those persons who had attained to the highest office of the community in their native home; these alone were allowed to exchange their colonial burgess-rights for the Roman. This clearly shows the complete revolution in the position of Rome. So long as Rome was still but one among the many urban communities of Italy, although that one might be the first, admission even to the unrestricted Roman franchise was universally regarded as a gain for the admitting community, and the acquisition of that franchise by non-burgesses was facilitated in every way, and was in fact often imposed on them as a punishment. But after the Roman community became sole sovereign and all the others were its servants, the state of matters changed. The Roman community began jealously to guard its franchise, and accordingly put an end in the first instance to the old full liberty of migration; although the statesmen of that period were wise enough still to keep admission to the Roman franchise legally open at least to the men of eminence and of capacity in the highest class of subject communities. The Latins were thus made to feel that Rome, after having subjugated Italy mainly by their aid, had now no longer need of them as before.

Non-Latin Allied Communities

Lastly, the relations of the non-Latin allied communities were subject, as a matter of course, to very various rules, just as each particular treaty of alliance had defined them. Several of these perpetual alliances, such as that with the Hernican communities,⁽³⁵⁾ passed over to a footing of complete equalization with the Latin. Others, in which this was not the case, such as those with Neapolis⁽³⁶⁾, Nola⁽³⁷⁾, and Heraclea⁽³⁸⁾, granted rights comparatively comprehensive; while others, such as the Tarentine and Samnite treaties, may have approximated to despotism.

Page 381

Dissolution of National Leagues— Furnishing of Contingents

As a general rule, it may be taken for granted that not only the Latin and Hernican national confederations—as to which the fact is expressly stated—but all such confederations subsisting in Italy, and the Samnite and Lucanian leagues in particular, were legally dissolved or at any rate reduced to insignificance, and that in general no Italian community was allowed the right of acquiring property or of intermarriage, or even the right of joint consultation and resolution, with any other. Further, provision must have been made, under different forms, for placing the military and financial resources of all the Italian communities at the disposal of the leading community. Although the burgess militia on the one hand, and the contingents of the “Latin name” on the other, were still regarded as the main and integral constituents of the Roman army, and in that way its national character was on the whole preserved, the Roman *-cives sine suffragio*—were called forth to join its ranks, and not only so, but beyond doubt the non-Latin federate communities also were either bound to furnish ships of war, as was the case with the Greek cities, or were placed on the roll of contingent-furnishing Italians (*-formula togatorum-*), as must have been ordained at once or gradually in the case of the Apulians, Sabellians, and Etruscans. In general this contingent, like that of the Latin communities, appears to have had its numbers definitely fixed, although, in case of necessity, the leading community was not precluded from making a larger requisition. This at the same time involved an indirect taxation, as every community was bound itself to equip and to pay its own contingent. Accordingly it was not without design that the supply of the most costly requisites for war devolved chiefly on the Latin, or non-Latin federate communities; that the war marine was for the most part kept up by the Greek cities; and that in the cavalry service the allies, at least subsequently, were called upon to furnish a proportion thrice as numerous as the Roman burgesses, while in the infantry the old principle, that the contingent of the allies should not be more numerous than the burgess army, still remained in force for a long time at least as the rule.

System of Government— Division and Classification of the Subjects

The system, on which this fabric was constructed and kept together, can no longer be ascertained in detail from the few notices that have reached us. Even the numerical proportions of the three classes of subjects relatively to each other and to the full burgesses, can no longer be determined even approximately;⁽³⁹⁾ and in like manner the geographical distribution of the several categories over Italy is but imperfectly known. The leading ideas on which the structure was based, on the other hand, are so obvious that it is scarcely necessary specially to set them forth.

Page 382

First of all, as we have already said, the immediate circle of the ruling community was extended—partly by the settlement of full burgesses, partly by the conferring of passive burgess-rights—as far as was possible without completely decentralizing the Roman community, which was an urban one and was intended to remain so. When the system of incorporation was extended up to and perhaps even beyond its natural limits, the communities that were subsequently added had to submit to a position of subjection; for a pure hegemony as a permanent relation was intrinsically impossible. Thus not through any arbitrary monopolizing of sovereignty, but through the inevitable force of circumstances, by the side of the class of ruling burgesses a second class of subjects took its place. It was one of the primary expedients of Roman rule to subdivide the governed by breaking up the Italian confederacies and instituting as large a number as possible of comparatively small communities, and to graduate the pressure of that rule according to the different categories of subjects. As Cato in the government of his household took care that the slaves should not be on too good terms with one another, and designedly fomented variances and factions among them, so the Roman community acted on a great scale. The expedient was not generous, but it was effectual.

Aristocratic Remodelling of the Constitutions of the Italian Communities

It was but a wider application of the same expedient, when in each dependent community the constitution was remodelled after the Roman pattern and a government of the wealthy and respectable families was installed, which was naturally more or less keenly opposed to the multitude and was induced by its material interests and by its wish for local power to lean on Roman support. The most remarkable instance of this sort is furnished by the treatment of Capua, which appears to have been from the first treated with suspicious precaution as the only Italian city that could come into possible rivalry with Rome. The Campanian nobility received a privileged jurisdiction, separate places of assembly, and in every respect a distinctive position; indeed they even obtained not inconsiderable pensions—sixteen hundred of them at 450 -stateres- (about 30 pounds) annually—charged on the Campanian exchequer. It was these Campanian equites, whose refusal to take part in the great Latino-Campanian insurrection of 414 mainly contributed to its failure, and whose brave swords decided the day in favour of the Romans at Sentinum in 459;(40) whereas the Campanian infantry at Rhegium was the first body of troops that in the war with Pyrrhus revolted from Rome.(41) Another remarkable instance of the Roman practice of turning to account for their own interest the variances between the orders in the dependent communities by favouring the aristocracy, is furnished by the treatment which Volsinii met with in 489. There, just as in Rome, the old and

Page 383

new burgesses must have stood opposed to one another, and the latter must have attained by legal means equality of political rights. In consequence of this the old burgesses of Volsinii resorted to the Roman senate with a request for the restoration of their old constitution—a step which the ruling party in the city naturally viewed as high treason, and inflicted legal punishment accordingly on the petitioners. The Roman senate, however, took part with the old burgesses, and, when the city showed no disposition to submit, not only destroyed by military violence the communal constitution of Volsinii which was in recognized operation, but also, by razing the old capital of Etruria, exhibited to the Italians a fearfully palpable proof of the mastery of Rome.

Moderation of the Government

But the Roman senate had the wisdom not to overlook the fact, that the only means of giving permanence to despotism is moderation on the part of the despots. On that account there was left with, or conferred on, the dependent communities an autonomy, which included a shadow of independence, a special share in the military and political successes of Rome, and above all a free communal constitution—so far as the Italian confederacy extended, there existed no community of Helots. On that account also Rome from the very first, with a clear-sightedness and magnanimity perhaps unparalleled in history, waived the most dangerous of all the rights of government, the right of taxing her subjects. At the most tribute was perhaps imposed on the dependent Celtic cantons: so far as the Italian confederacy extended, there was no tributary community. On that account, lastly, while the duty of bearing arms was partially devolved on the subjects, the ruling burgesses were by no means exempt from it; it is probable that the latter were proportionally far more numerous than the body of the allies; and in that body, again, probably the Latins as a whole were liable to far greater demands upon them than the non-Latin allied communities. There was thus a certain reasonableness in the appropriation by which Rome ranked first, and the Latins next to her, in the distribution of the spoil acquired in war.

Intermediate Functionaries— Valuation of the Empire

The central administration at Rome solved the difficult problem of preserving its supervision and control over the mass of the Italian communities liable to furnish contingents, partly by means of the four Italian quaestorships, partly by the extension of the Roman censorship over the whole of the dependent communities. The quaestors of the fleet,(42) along with their more immediate duty, had to raise the revenues from the newly acquired domains and to control the contingents of the new allies; they were the first Roman functionaries to whom a residence and district out of Rome were assigned by law, and they formed the necessary intermediate authority between the Roman senate and the Italian

Page 384

communities. Moreover, as is shown by the later municipal constitution, the chief functionaries in every Italian community,(43) whatever might be their title, had to undertake a valuation every fourth or fifth year—an institution, the suggestion of which must necessarily have emanated from Rome, and which can only have been intended to furnish the senate with a view of the resources in men and money of the whole of Italy, corresponding to the census in Rome.

Italy and the Italians

Lastly, with this military administrative union of the whole peoples dwelling to the south of the Apennines, as far as the lapygian promontory and the straits of Rhegium, was connected the rise of a new name common to them all—that of “the men of the toga” (-togati-), which was their oldest designation in Roman state law, or that of the “Italians,” which was the appellation originally in use among the Greeks and thence became universally current. The various nations inhabiting those lands were probably first led to feel and own their unity, partly through their common contrast to the Greeks, partly and mainly through their common resistance to the Celts; for, although an Italian community may now and then have made common cause with the Celts against Rome and employed the opportunity to recover independence, yet in the long run sound national feeling necessarily prevailed. As the “Gallic field” down to a late period stood contrasted in law with the Italian, so the “men of the toga” were thus named in contrast to the Celtic “men of the hose” (-braccati-); and it is probable that the repelling of the Celtic invasions played an important diplomatic part as a reason or pretext for centralizing the military resources of Italy in the hands of the Romans. Inasmuch as the Romans on the one hand took the lead in the great national struggle and on the other hand compelled the Etruscans, Latins, Sabellians, Apulians, and Hellenes (within the bounds to be immediately described) alike to fight under their standards, that unity, which hitherto had been undefined and latent rather than expressed, obtained firm consolidation and recognition in state law; and the name -Italia-, which originally and even in the Greek authors of the fifth century—in Aristotle for instance—pertained only to the modern Calabria, was transferred to the whole land of these wearers of the toga.

Earliest Boundaries of the Italian Confederacy

The earliest boundaries of this great armed confederacy led by Rome, or of the new Italy, reached on the western coast as far as the district of Leghorn south of the Arnus, (44) on the east as far as the Aesis north of Ancona. The townships colonized by Italians, lying beyond these limits, such as Sena Gallica and Ariminum beyond the Apennines, and Messina in Sicily, were reckoned geographically as situated out of Italy—even when, like Ariminum, they were members of the confederacy or even, like Sena, were Roman burgess communities. Still less could the Celtic cantons beyond the

Apennines be reckoned among the -togati-, although perhaps some of them were already among the clients of Rome.

Page 385

First Steps towards the Latinizing of Italy— New Position of Rome as a Great Power

The new Italy had thus become a political unity; it was also in the course of becoming a national unity. Already the ruling Latin nationality had assimilated to itself the Sabines and Volscians and had scattered isolated Latin communities over all Italy; these germs were merely developed, when subsequently the Latin language became the mother-tongue of every one entitled to wear the Latin toga. That the Romans already clearly recognized this as their aim, is shown by the familiar extension of the Latin name to the whole body of contingent-furnishing Italian allies.⁽⁴⁵⁾ Whatever can still be recognized of this grand political structure testifies to the great political sagacity of its nameless architects; and the singular cohesion, which that confederation composed of so many and so diversified ingredients subsequently exhibited under the severest shocks, stamped their great work with the seal of success. From the time when the threads of this net drawn as skilfully as firmly around Italy were concentrated in the hands of the Roman community, it was a great power, and took its place in the system of the Mediterranean states in the room of Tarentum, Lucania, and other intermediate and minor states erased by the last wars from the list of political powers. Rome received, as it were, an official recognition of its new position by means of the two solemn embassies, which in 481 were sent from Alexandria to Rome and from Rome to Alexandria, and which, though primarily they regulated only commercial relations, beyond doubt prepared the way for a political alliance. As Carthage was contending with the Egyptian government regarding Cyrene and was soon to contend with that of Rome regarding Sicily, so Macedonia was contending with the former for the predominant influence in Greece, with the latter proximately for the dominion of the Adriatic coasts. The new struggles, which were preparing on all sides, could not but influence each other, and Rome, as mistress of Italy, could not fail to be drawn into the wide arena which the victories and projects of Alexander the Great had marked out as the field of conflict for his successors.

Notes for Book II Chapter VII

1. The story that the Romans also sent envoys to Alexander at Babylon on the testimony of Clitarchus (Plin. Hist. Nat. iii. 5, 57), from whom the other authorities who mention this fact (Aristus and Asclepiades, ap. Arrian, vii. 15, 5; Memnon, c. 25) doubtless derived it. Clitarchus certainly was contemporary with these events; nevertheless, his Life of Alexander was decidedly a historical romance rather than a history; and, looking to the silence of the trustworthy biographers (Arrian, l. c.; Liv. ix. 18) and the utterly romantic details of the account—which represents the Romans, for instance, as delivering to Alexander a chaplet of gold, and the latter as prophesying the future greatness of Rome—we cannot but set down this story as one of the many embellishments which Clitarchus introduced into the history.

Page 386

2. II. *Vi.* Last Struggles of Samnium

3. Near the modern Anglona; not to be confounded with the better known town of the same name in the district of Cosenza.

4. These numbers appear credible. The Roman account assigns, probably in dead and wounded, 15,000 to each side; a later one even specifies 5000 as dead on the Roman, and 20,000 on the Greek side. These accounts may be mentioned here for the purpose of exhibiting, in one of the few instances where it is possible to check the statement, the untrustworthiness—almost without exception—of the reports of numbers, which are swelled by the unscrupulous invention of the annalists with avalanche-like rapidity.

5. The later Romans, and the moderns following them, give a version of the league, as if the Romans had designedly avoided accepting the Carthaginian help in Italy. This would have been irrational, and the facts pronounce against it. The circumstance that Mago did not land at Ostia is to be explained not by any such foresight, but simply by the fact that Latium was not at all threatened by Pyrrhus and so did not need Carthaginian aid; and the Carthaginians certainly fought for Rome in front of Rhegium.

18. These were Pyrgi, Ostia, Antium, Tarracina, Minturnae, Sinuessa Sena Gallica, and Castrum Novum.

19. This statement is quite as distinct (Liv. viii. 14; -interdictum mari Antiati populo est-) as it is intrinsically credible; for Antium was inhabited not merely by colonists, but also by its former citizens who had been nursed in enmity to Rome (*ii.* V. Colonizations in The Land Of The Volsci). This view is, no doubt, inconsistent with the Greek accounts, which assert that Alexander the Great (431) and Demetrius Poliorcetes (471) lodged complaints at Rome regarding Antiatic pirates. The former statement is of the same stamp, and perhaps from the same source, with that regarding the Roman embassy to Babylon (*ii.* VII. Relations Between The East and West). It seems more likely that Demetrius Poliorcetes may have tried by edict to put down piracy in the Tyrrhene sea which he had never set eyes upon, and it is not at all inconceivable that the Antiates may have even as Roman citizens, in defiance of the prohibition, continued for a time their old trade in an underhand fashion: much dependence must not however, be placed even on the second story.

22. According to Servius (in Aen. iv. 628) it was stipulated in the Romano-Carthaginian treaties, that no Roman should set foot on (or rather occupy) Carthaginian, and no Carthaginian on Roman, soil, but Corsica was to remain in a neutral position between them (-ut neque Romani ad litora Carthaginiensium accederent neque Carthaginienses ad litora Romanorum.....Corsica esset media inter Romanos et Carthaginienses-). This appears to refer to our present period, and the colonization of Corsica seems to have been prevented by this very treaty.

23. II. VII. Submission of Lower Italy

24. The clause, by which a dependent people binds itself "to uphold in a friendly manner the sovereignty of that of Rome" (-maiestatem populi Romani comiter conservare-), is certainly the technical appellation of that mildest form of subjection, but it probably did not come into use till a considerably later period (Cic. pro Balbo, 16, 35). The appellation of clientship derived from private law, aptly as in its very indefiniteness it denotes the relation (Dig. xlix. 15, 7, i), was scarcely applied to it officially in earlier times.

30. That Tusculum as it was the first to obtain passive burgess-rights (*ii.* V. Crises within the Romano-Latin League) was also the first to exchange these for the rights of full burgesses, is probable in itself and presumably it is in the latter and not in the former respect that the town is named by Cicero (pro Mur. 8, 19) -municipium antiquissimum-.

31. II. V. Complete Submission of the Volscian and Campanian Provinces

32. II. IV. South Etruria Roman

33. -V. Cervio A. f. cosol dedicavit- and -Iunonei Quiritri sacra. C. Falcilius L. f. consol dedicavit-.

34. According to the testimony of Cicero (pro Caec. 35) Sulla gave to the Volaterrans the former -ius- of Ariminum, that is—adds the orator—the -ius- of the “twelve colonies” which had not the Roman -civitas- but had full -commercium- with the Romans. Few things have been so much discussed as the question to what places this -ius- of the twelve towns refers; and yet the answer is not far to seek. There were in Italy and Cisalpine Gaul—laying aside some places that soon disappeared again—thirty-four Latin colonies established in all. The twelve most recent of these—Ariminum, Beneventum, Firmum, Aesernia, Brundisium, Spoletium, Cremona, Placentia, Copia, Valentia, Bononia, and Aquileia—are those here referred

Page 388

to; and because Ariminum was the oldest of these and the town for which this new organization was primarily established, partly perhaps also because it was the first Roman colony founded beyond Italy, the -ius- of these colonies rightly took its name from Ariminum. This at the same time demonstrates the truth of the view—which already had on other grounds very high probability—that all the colonies established in Italy (in the wider sense of the term) after the founding of Aquileia belonged to the class of burgess-colonies.

We cannot fully determine the extent to which the curtailment of the rights of the more recent Latin towns was carried, as compared with the earlier. If intermarriage, as is not improbable but is in fact anything but definitely established (i. 132; Diodor. p. 590, 62, fr. Vat. p. 130, Dind.), formed a constituent element of the original federal equality of rights, it was, at any rate, no longer conceded to the Latin colonies of more recent origin.

38. II. VII. The War in Italy Flags

39. It is to be regretted that we are unable to give satisfactory information as to the proportional numbers. We may estimate the number of Roman burgesses capable of bearing arms in the later regal period as about 20,000. (I. Vi. Time and Occasion of the Reform) Now from the fall of Alba to the conquest of Veii the immediate territory of Rome received no material extension; in perfect accordance with which we find that from the first institution of the twenty-one tribes about 259, (ii. II. Coriolanus) which involved no, or at any rate no considerable, extension of the Roman bounds, no new tribes were instituted till 367. However abundant allowance we make for increase by the excess of births over deaths, by immigration, and by manumissions, it is absolutely impossible to reconcile with the narrow limits of a territory of hardly 650 square miles the traditional numbers of the census, according to which the number of Roman burgesses capable of bearing arms in the second half of the third century varied between 104,000 and 150,000, and in 362, regarding which a special statement is extant, amounted to 152,573. These numbers must rather stand on a parallel with the 84,700 burgesses of the Servian census; and in general the whole earlier census-lists, carried back to the four lustres of Servius Tullius and furnished with copious numbers, must belong to the class of those apparently documentary traditions which delight in, and betray themselves by the very fact of, such numerical details.

Page 389

It was only with the second half of the fourth century that the large extensions of territory, which must have suddenly and considerably augmented the burgess roll, began. It is reported on trustworthy authority and is intrinsically credible, that about 416 the Roman burgesses numbered 165,000; which very well agrees with the statement that ten years previously, when the whole militia was called out against Latium and the Gauls, the first levy amounted to ten legions, that is, to 50,000 men. Subsequently to the great extensions of territory in Etruria, Latium, and Campania, in the fifth century the effective burgesses numbered, on an average, 250,000; immediately before the first Punic war, 280,000 to 290,000. These numbers are certain enough, but they are not quite available historically for another reason, namely, that in them probably the Roman full burgesses and the "burgesses without vote" not serving, like the Campanians, in legions of their own, —such, e. g., as the Caerites, —are included together in the reckoning, while the latter must at any rate -de facto- be counted among the subjects (Rom. Forsch. ii. 396).

40. II. Vi. Battle of Sentinum

41. II. VII. Commencement of the Conflict in Lower Italy

42. II. VII. Quaestors of the Fleet

43. Not merely in every Latin one; for the censorship or so-called -quinquennialitas- occurs, as is well known, also among communities whose constitution was not formed according to the Latin scheme.

44. This earliest boundary is probably indicated by the two small townships -Ad fines-, of which one lay north of Arezzo on the road to Florence, the second on the coast not far from Leghorn. Somewhat further to the south of the latter, the brook and valley of Vada are still called -Fiume della fine-, -Valle della fine- (Targioni Tozzetti, Viaggi, iv. 430).

45. In strict official language, indeed, this was not the case. The fullest designation of the Italians occurs in the agrarian law of 643, line 21; -[ceivis] Romanus sociumve nominisve Latini, quibus ex formula togatorum [milites in terra Italia imperare solent]-; in like manner at the 29th line of the same -peregrinus- is distinguished from the -Latinus-, and in the decree of the senate as to the Bacchanalia in 568 the expression is used: -ne quis ceivis Romanus neve nominis Latini neve socium quisquam-. But in common use very frequently the second or third of these three subdivisions is omitted, and along with the Romans sometimes only those Latini nominis are mentioned, sometimes only the -socii- (Weissenborn on Liv. xxii. 50, 6), while there is no difference in the meaning. The designation -homines nominis Latini ac socii Italici- (Sallust. Jug. 40), correct as it is in itself, is foreign to the official -usus loquendi, which knows -Italia-, but not -Italici-.

CHAPTER VIII

Law, Religion, Military System, Economic Condition, Nationality

Page 390

Development of Law

In the development which law underwent during this period within the Roman community, probably the most important material innovation was that peculiar control which the community itself, and in a subordinate degree its office-bearers, began to exercise over the manners and habits of the individual burgesses. The germ of it is to be sought in the right of the magistrate to inflict property-fines (-multae-) for offences against order.(1) In the case of all fines of more than two sheep and thirty oxen or, after the cattle-fines had been by the decree of the people in 324 commuted into money, of more than 3020 libral -asses- (30 pounds), the decision soon after the expulsion of the kings passed by way of appeal into the hands of the community;(2) and thus procedure by fine acquired an importance which it was far from originally possessing. Under the vague category of offences against order men might include any accusations they pleased, and by the higher grades in the scale of fines they might accomplish whatever they desired. The dangerous character of such arbitrary procedure was brought to light rather than obviated by the mitigating proviso, that these property-fines, where they were not fixed by law at a definite sum, should not amount to half the estate belonging to the person fined. To this class belonged the police-laws, which from the earliest times were especially abundant in the Roman community. Such were those enactments of the Twelve Tables, which prohibited the anointing of a dead body by persons hired for the purpose, the dressing it out with more than one cushion or more than three purple-edged coverings, the decorating it with gold or gaudy chaplets, the use of dressed wood for the funeral pile, and the perfuming or sprinkling of the pyre with frankincense or myrrh-wine; which limited the number of flute-players in the funeral procession to ten at most; and which forbade wailing women and funeral banquets—in a certain measure the earliest Roman legislation against luxury. Such also were the laws—originating in the conflicts of the orders—directed against usury as well as against an undue use of the common pasture and a disproportionate appropriation of the occupiable domain-land. But far more fraught with danger than these and similar fining-laws, which at any rate formulated once for all the trespass and often also the measure of punishment, was the general prerogative of every magistrate who exercised jurisdiction to inflict a fine for an offence against order, and, if the fine reached the amount necessary to found an appeal and the person fined did not submit to the penalty, to bring the case before the community. Already in the course of the fifth century quasi-criminal proceedings had been in this way instituted against immorality of life both in men and women, against the forestalling of grain, witchcraft, and similar matters.

Page 391

Closely akin to this was the quasi-jurisdiction of the censors, which likewise sprang up at this period. They were invested with authority to adjust the Roman budget and the burgess-roll, and they availed themselves of it, partly to impose of their own accord taxes on luxury which differed only in form from penalties on it, partly to abridge or withdraw the political privileges of the burgess who was reported to have been guilty of any infamous action.(3) The extent to which this surveillance was already carried is shown by the fact that penalties of this nature were inflicted for the negligent cultivation of a man's own land, and that such a man as Publius Cornelius Rufinus (consul in 464, 477) was struck off the list of senators by the censors of 479, because he possessed silver plate to the value of 3360 sesterces (34 pounds). No doubt, according to the rule generally applicable to the edicts of magistrates,(4) the sentences of the censors had legal force only during their censorship, that is on an average for the next five years, and might be renewed or not by the next censors at pleasure. Nevertheless this censorial prerogative was of so immense importance, that in virtue of it the censorship, originally a subordinate magistracy, became in rank and consideration the first of all.(5) The government of the senate rested essentially on this twofold police control supreme and subordinate, vested in the community and its officials, and furnished with powers as extensive as they were arbitrary. Like every such arbitrary government, it was productive of much good and much evil, and we do not mean to combat the view of those who hold that the evil preponderated. But we must not forget that—amidst the morality external certainly but stern and energetic, and the powerful enkindling of public spirit, that were the genuine characteristics of this period—these institutions remained exempt as yet from any really base misuse; and if they were the chief instruments in repressing individual freedom, they were also the means by which the public spirit and the good old manners and order of the Roman community were with might and main upheld.

Modifications in the Laws

Along with these changes a humanizing and modernizing tendency showed itself slowly, but yet clearly enough, in the development of Roman law. Most of the enactments of the Twelve Tables, which coincide with the laws of Solon and therefore may with reason be considered as in substance innovations, bear this character; such as the securing the right of free association and the autonomy of the societies that originated under it; the enactment that forbade the ploughing up of boundary-balks; and the mitigation of the punishment of theft, so that a thief not caught in the act might henceforth release himself from the plaintiff's suit by payment of double compensation. The law of debt was modified in a similar sense, but not till upwards of a century afterwards, by the

Page 392

Poetelian law.(6) The right freely to dispose of property, which according to the earliest Roman law was accorded to the owner in his lifetime but in the case of death had hitherto been conditional on the consent of the community, was liberated from this restriction, inasmuch as the law of the Twelve Tables or its interpretation assigned to the private testament the same force as pertained to that confirmed in the curies. This was an important step towards the breaking up of the clanships, and towards the full carrying out of individual liberty in the disposal of property. The fearfully absolute paternal power was restricted by the enactment, that a son thrice sold by his father should not relapse into his power, but should thenceforth be free; to which—by a legal inference that, strictly viewed, was no doubt absurd—was soon attached the possibility that a father might voluntarily divest himself of dominion over his son by emancipation. In the law of marriage civil marriage was permitted;(7) and although the full marital power was associated as necessarily with a true civil as with a true religious marriage, yet the permission of a connection instead of marriage,(8) formed without that power, constituted a first step towards relaxation of the full power of the husband. The first step towards a legal enforcement of married life was the tax on old bachelors (-aes uxorium-) with the introduction of which Camillus began his public career as censor in 351.

Administration of Justice—
Code of Common Law—
New Judicial Functionaries

Changes more comprehensive than those effected in the law itself were introduced into—what was more important in a political point of view, and more easily admitted of alteration—the system of judicial administration. First of all came the important limitation of the supreme judicial power by the embodiment of the common law in a written code, and the obligation of the magistrate thenceforth to decide no longer according to varying usage, but according to the written letter, in civil as well as in criminal procedure (303, 304). The appointment of a supreme magistrate in Rome exclusively for the administration of justice in 387,(9) and the establishment of separate police functionaries which took place contemporaneously in Rome, and was imitated under Roman influence in all the Latin communities,(10) secured greater speed and precision of justice. These police-magistrates or aediles had, of course, a certain jurisdiction at the same time assigned to them. On the one hand, they were the ordinary civil judges for sales concluded in open market, for the cattle and slave markets in particular; and on the other hand, they ordinarily acted in processes of fines and amercements as judges of first instance or—which was in Roman law the same thing—as public prosecutors. In consequence of this the administration of the laws imposing fines, and the equally indefinite and politically important right of fining in general, were

Page 393

vested mainly in them. Similar but subordinate functions, having especial reference to the poorer classes, pertained to the three night—or blood-masters (-tres viri nocturni- or -capitales-), first nominated in 465; they were entrusted with the duties of nocturnal police as regards fire and the public safety and with the superintendence of executions, with which a certain summary jurisdiction was very soon, perhaps even from the outset, associated.(11) Lastly from the increasing extent of the Roman community it became necessary, out of regard to the convenience of litigants, to station in the more remote townships special judges competent to deal at least with minor civil causes. This arrangement was the rule for the communities of burgesses -sine suffragio-, (12) and was perhaps even extended to the more remote communities of full burgesses, (13)—the first germs of a Romano-municipal jurisdiction developing itself by the side of that which was strictly Roman.

Changes in Procedure

In civil procedure (which, however, according to the ideas of that period included most of the crimes committed against fellow-citizens) the division of a process into the settlement of the question of law before the magistrate (-ius-), and the decision of the question of fact by a private person nominated by the magistrate (-iudicium-) —a division doubtless customary even in earlier times—was on the abolition of the monarchy prescribed by law; (14) and to that separation the private law of Rome was mainly indebted for its logical clearness and practical precision. (15) In actions regarding property, the decision as to what constituted possession, which hitherto had been left to the arbitrary caprice of the magistrate, was subjected gradually to legal rules; and, alongside of the law of property, a law of possession was developed—another step, by which the magisterial authority lost an important part of its powers. In criminal processes, the tribunal of the people, which hitherto had exercised the prerogative of mercy, became a court of legally secured appeal. If the accused after hearing (-quaestio-) was condemned by the magistrate and appealed to the burgesses, the magistrate proceeded in presence of these to the further hearing (-anquisitio-) and, when he after three times discussing the matter before the community had repeated his decision, in the fourth diet the sentence was confirmed or rejected by the burgesses. Modification was not allowed. A similar republican spirit breathed in the principles, that the house protected the burgess, and that an arrest could only take place out of doors; that imprisonment during investigation was to be avoided; and that it was allowable for every accused and not yet condemned burgess by renouncing his citizenship to withdraw from the consequences of condemnation, so far as they affected not his property but his person-principles, which certainly were not embodied in formal laws and accordingly did not legally bind the prosecuting magistrate,

Page 394

but yet were by their moral weight of the greatest influence, particularly in limiting capital punishment. But, if the Roman criminal law furnishes a remarkable testimony to the strong public spirit and to the increasing humanity of this epoch, it on the other hand suffered in its practical working from the struggles between the orders, which in this respect were specially baneful. The co-ordinate primary jurisdiction of all the public magistrates in criminal cases, that arose out of these conflicts,(16) led to the result, that there was no longer any fixed authority for giving instructions, or any serious preliminary investigation, in Roman criminal procedure. And, as the ultimate criminal jurisdiction was exercised in the forms and by the organs of legislation, and never disowned its origin from the prerogative of mercy; as, moreover, the treatment of police fines had an injurious reaction on the criminal procedure which was externally very similar; the decision in criminal causes was pronounced—and that not so much by way of abuse, as in some degree by virtue of the constitution—not according to fixed law, but according to the arbitrary pleasure of the judges. In this way the Roman criminal procedure was completely void of principle, and was degraded into the sport and instrument of political parties; which can the less be excused, seeing that this procedure, while especially applied to political crimes proper, was applicable also to others, such as murder and arson. The evil was aggravated by the clumsiness of that procedure, which, in concert with the haughty republican contempt for non-burgesses, gave rise to a growing custom of tolerating, side by side with the more formal process, a summary criminal, or rather police, procedure against slaves and common people. Here too the passionate strife regarding political processes overstepped natural limits, and introduced institutions which materially contributed to estrange the Romans step by step from the idea of a fixed moral order in the administration of justice.

Religion— New Gods

We are less able to trace the progress of the religious conceptions of the Romans during this epoch. In general they adhered with simplicity to the simple piety of their ancestors, and kept equally aloof from superstition and from unbelief. How vividly the idea of spiritualizing all earthly objects, on which the Roman religion was based, still prevailed at the close of this epoch, is shown by the new “God of silver” (-Argentinus-), who presumably came into existence only in consequence of the introduction of the silver currency in 485, and who naturally was the son of the older “God of copper” (-Aesculanus-).

Page 395

The relations to foreign lands were the same as heretofore; but here, and here especially, Hellenic influences were on the increase. It was only now that temples began to rise in Rome itself in honour of the Hellenic gods. The oldest was the temple of Castor and Pollux, which had been vowed in the battle at lake Regillus(17) and was consecrated on 15th July 269. The legend associated with it, that two youths of superhuman size and beauty had been seen fighting on the battle-field in the ranks of the Romans and immediately after the battle watering their foaming steeds in the Roman Forum at the fountain of Iuturna, and announcing the great victory, bears a stamp thoroughly un-Roman, and was beyond doubt at a very early period modelled on the appearance of the Dioscuri—similar down to its very details—in the famous battle fought about a century before between the Crotoniates and Locrians at the river Sagras. The Delphic Apollo too was not only consulted—as was usual with all peoples that felt the influence of Grecian culture—and presented moreover after special successes, such as the capture of Veii, with a tenth of the spoil (360), but also had a temple built for him in the city (323, renewed 401). The same honour was towards the close of this period accorded to Aphrodite (459), who was in some enigmatical way identified with the old Roman garden goddess, Venus;(18) and to Asklapios or Aesculapius, who was obtained by special request from Epidaurus in the Peloponnesus and solemnly conducted to Rome (463). Isolated complaints were heard in serious emergencies as to the intrusion of foreign superstition, presumably the art of the Etruscan -haruspices- (as in 326); but in such cases the police did not fail to take proper cognisance of the matter.

In Etruria on the other hand, while the nation stagnated and decayed in political nullity and indolent opulence, the theological monopoly of the nobility, stupid fatalism, wild and meaningless mysticism, the system of soothsaying and of mendicant prophecy gradually developed themselves, till they reached the height at which we afterwards find them.

Sacerdotal System

In the sacerdotal system no comprehensive changes, so far as we know, took place. The more stringent enactments, that were made about 465 regarding the collection of the process-fines destined to defray the cost of public worship, point to an increase in the ritual budget of the state—a necessary result of the increase in the number of its gods and its temples. It has already been mentioned as one of the evil effects of the dissensions between the orders that an illegitimate influence began to be conceded to the colleges of men of lore, and that they were employed for the annulling of political acts(19)—a course by which on the one hand the faith of the people was shaken, and on the other hand the priests were permitted to exercise a very injurious influence on public affairs.

Military System—
Manipular Legion—

Entrenchment of Camp—
Cavalry—
Officers—
Military Discipline—
Training and Classes of Soldiers—
Military Value of the Manipular Legion

Page 396

A complete revolution occurred during this epoch in the military system. The primitive Graeco-Italian military organization, which was probably based, like the Homeric, on the selection of the most distinguished and effective warriors—who ordinarily fought on horseback—to form a special vanguard, had in the later regal period been superseded by the -legio—the old Dorian phalanx of hoplites, probably eight file deep.(20) This phalanx thenceforth undertook the chief burden of the battle, while the cavalry were stationed on the flanks, and, mounted or dismounted according to circumstances, were chiefly employed as a reserve. From this arrangement there were developed nearly at the same time the phalanx of -sarrissae-in Macedonia and the manipular arrangement in Italy, the former formed by closing and deepening, the latter by breaking up and multiplying, the ranks, in the first instance by the division of the old -legio- of 8400 into two -legiones- of 4200 men each. The old Doric phalanx had been wholly adapted to close combat with the sword and especially with the spear, and only an accessory and subordinate position in the order of battle was assigned to missile weapons. In the manipular legion the thrusting-lance was confined to the third division, and instead of it the first two were furnished with a new and peculiar Italian missile weapon, the -pilum- a square or round piece of wood, four and a half feet long, with a triangular or quadrangular iron point—which had been originally perhaps invented for the defence of the ramparts of the camp, but was soon transferred from the rear to the front ranks, and was hurled by the advancing line into the ranks of the enemy at a distance of from ten to twenty paces. At the same time the sword acquired far greater importance than the short knife of the phalangite could ever have had; for the volley of javelins was intended in the first instance merely to prepare the way for an attack sword in hand. While, moreover, the phalanx had, as if it were a single mighty lance, to be hurled at once upon the enemy, in the new Italian legion the smaller units, which existed also in the phalanx system but were in the order of battle firmly and indissolubly united, were tactically separated from each other. Not merely was the close square divided, as we have said, into two equally strong halves, but each of these was separated in the direction of its depth into the three divisions of the -hastati-, — principes-, and -triarii-, each of a moderate depth probably amounting in ordinary cases to only four files; and was broken up along the front into ten bands (-manipuli-), in such a way that between every two divisions and every two maniples there was left a perceptible interval. It was a mere continuation of the same process of individualizing, by which the collective mode of fighting was discouraged even in the diminished tactical unit and the single combat became prominent, as is evident from the (already mentioned) decisive part played

Page 397

by hand-to-hand encounters and combats with the sword. The system of entrenching the camp underwent also a peculiar development. The place where the army encamped, even were it only for a single night, was invariably provided with a regular circumvallation and as it were converted into a fortress. Little change took place on the other hand in the cavalry, which in the manipular legion retained the secondary part which it had occupied by the side of the phalanx. The system of officering the army also continued in the main unchanged; only now over each of the two legions of the regular army there were set just as many war-tribunes as had hitherto commanded the whole army, and the number of staff-officers was thus doubled. It was at this period probably that the clear line of demarcation became established between the subaltern officers, who as common soldiers had to gain their place at the head of the maniples by the sword and passed by regular promotion from the lower to the higher maniples, and the military tribunes placed at the head of whole legions—six to each—in whose case there was no regular promotion, and for whom men of the better class were usually taken. In this respect it must have become a matter of importance that, while previously the subaltern as well as the staff-officers had been uniformly nominated by the general, after 392 some of the latter posts were filled up through election by the burgesses.(21) Lastly, the old, fearfully strict, military discipline remained unaltered. Still, as formerly, the general was at liberty to behead any man serving in his camp, and to scourge with rods the staff-officer as well as the common soldier; nor were such punishments inflicted merely on account of common crimes, but also when an officer had allowed himself to deviate from the orders which he had received, or when a division had allowed itself to be surprised or had fled from the field of battle. On the other hand, the new military organization necessitated a far more serious and prolonged military training than the previous phalanx system, in which the solidity of the mass kept even the inexperienced in their ranks. If nevertheless no special soldier-class sprang up, but on the contrary the army still remained, as before, a burgess army, this object was chiefly attained by abandoning the former mode of ranking the soldiers according to property(22) and arranging them according to length of service. The Roman recruit now entered among the light-armed “skirmishers” (-rorarii-), who fought outside of the line and especially with stone slings, and he advanced from this step by step to the first and then to the second division, till at length the soldiers of long service and experience were associated together in the corps of the -trarii-, which was numerically the weakest but imparted its tone and spirit to the whole army.

Page 398

The excellence of this military organization, which became the primary cause of the superior political position of the Roman community, chiefly depended on the three great military principles of maintaining a reserve, of combining the close and distant modes of fighting, and of combining the offensive and the defensive. The system of a reserve was already foreshadowed in the earlier employment of the cavalry, but it was now completely developed by the partition of the army into three divisions and the reservation of the flower of the veterans for the last and decisive shock. While the Hellenic phalanx had developed the close, and the Oriental squadrons of horse armed with bows and light missile spears the distant, modes of fighting respectively, the Roman combination of the heavy javelin with the sword produced results similar, as has justly been remarked, to those attained in modern warfare by the introduction of bayonet-muskets; the volley of javelins prepared the way for the sword encounter, exactly in the same way as a volley of musketry now precedes a charge with the bayonet. Lastly, the elaborate system of encampment allowed the Romans to combine the advantages of defensive and offensive war and to decline or give battle according to circumstances, and in the latter case to fight under the ramparts of their camp just as under the walls of a fortress—the Roman, says a Roman proverb, conquers by sitting still.

Origin of the Manipular Legion

That this new military organization was in the main a Roman, or at any rate Italian, remodelling and improvement of the old Hellenic tactics of the phalanx, is plain. If some germs of the system of reserve and of the individualizing of the smaller subdivisions of the army are found to occur among the later Greek strategists, especially Xenophon, this only shows that they felt the defectiveness of the old system, but were not well able to obviate it. The manipular legion appears fully developed in the war with Pyrrhus; when and under what circumstances it arose, whether at once or gradually, can no longer be ascertained. The first tactical system which the Romans encountered, fundamentally different from the earlier Italo-Hellenic system, was the Celtic sword-phalanx. It is not impossible that the subdivision of the army and the intervals between the maniples in front were arranged with a view to resist, as they did resist, its first and only dangerous charge; and it accords with this hypothesis that Marcus Furius Camillus, the most celebrated Roman general of the Gallic epoch, is presented in various detached notices as the reformer of the Roman military system. The further traditions associated with the Samnite and Pyrrhic wars are neither sufficiently accredited, nor can they with certainty be duly arranged;(23) although it is in itself probable that the prolonged Samnite mountain warfare exercised a lasting influence on the individual development of the Roman soldier, and that the struggle with one of the first masters of the art of war, belonging to the school of the great Alexander, effected an improvement in the technical features of the Roman military system.

Page 399

National Economy—
The Farmers—
Farming of Estates

In the national economy agriculture was, and continued to be, the social and political basis both of the Roman community and of the new Italian state. The common assembly and the army consisted of Roman farmers; what as soldiers they had acquired by the sword, they secured as colonists by the plough. The insolvency of the middle class of landholders gave rise to the formidable internal crises of the third and fourth centuries, amidst which it seemed as if the young republic could not but be destroyed. The revival of the Latin farmer-class, which was produced during the fifth century partly by the large assignments of land and incorporations, partly by the fall in the rate of interest and the increase of the Roman population, was at once the effect and the cause of the mighty development of Roman power. The acute soldier's eye of Pyrrhus justly discerned the cause of the political and military ascendancy of the Romans in the flourishing condition of the Roman farms. But the rise also of husbandry on a large scale among the Romans appears to fall within this period. In earlier times indeed there existed landed estates of—at least comparatively—large size; but their management was not farming on a large scale, it was simply a husbandry of numerous small parcels.⁽²⁴⁾ On the other hand the enactment in the law of 387, not incompatible indeed with the earlier mode of management but yet far more appropriate to the later, *viz.* that the landholder should be bound to employ along with his slaves a proportional number of free persons,⁽²⁵⁾ may well be regarded as the oldest trace of the later centralized farming of estates;⁽²⁶⁾ and it deserves notice that even here at its first emergence it essentially rests on slave-holding. How it arose, must remain an undecided point; possibly the Carthaginian plantations in Sicily served as models to the oldest Roman landholders, and perhaps even the appearance of wheat in husbandry by the side of spelt,⁽²⁷⁾ which Varro places about the period of the decemvirs, was connected with that altered style of management. Still less can we ascertain how far this method of husbandry had already during this period spread; but the history of the wars with Hannibal leaves no doubt that it cannot yet have become the rule, nor can it have yet absorbed the Italian farmer class. Where it did come into vogue, however, it annihilated the older clientship based on the *-precarium-*; just as the modern system of large farms has been formed in great part by the suppression of petty holdings and the conversion of hides into farm-fields. It admits of no doubt that the restriction of this agricultural clientship very materially contributed towards the distress of the class of small cultivators.

Inland Intercourse in Italy

Page 400

Respecting the internal intercourse of the Italians with each other our written authorities are silent; coins alone furnish some information. We have already mentioned(28) that in Italy, with the exception of the Greek cities and of the Etruscan Populonia, there was no coinage during the first three centuries of Rome, and that cattle in the first instance, and subsequently copper by weight, served as the medium of exchange. Within the present epoch occurred the transition on the part of the Italians from the system of barter to that of money; and in their money they were naturally led at first to Greek models. The circumstances of central Italy led however to the adoption of copper instead of silver as the metal for their coinage, and the unit of coinage was primarily based on the previous unit of value, the copper pound; hence they cast their coins instead of stamping them, for no die would have sufficed for pieces so large and heavy. Yet there seems from the first to have been a fixed ratio for the relative value of copper and silver (250:1), and with reference to that ratio the copper coinage seems to have been issued; so that, for example, in Rome the large copper piece, the -as-, was equal in value to a scruple (1/288 of a pound) of silver. It is a circumstance historically more remarkable, that coining in Italy most probably originated in Rome, and in fact with the decemvirs, who found in the Solonian legislation a pattern for the regulation of their coinage; and that from Rome it spread over a number of Latin, Etruscan, Umbrian, and east-Italian communities, —a clear proof of the superior position which Rome from the beginning of the fourth century held in Italy. As all these communities subsisted side by side in formal independence, legally the monetary standard was entirely local, and the territory of every city had its own monetary system. Nevertheless the standards of copper coinage in central and northern Italy may be comprehended in three groups, within which the coins in common intercourse seem to have been treated as homogeneous. These groups are, first, the coins of the cities of Etruria lying north of the Ciminian Forest and those of Umbria; secondly, the coins of Rome and Latium; and lastly, those of the eastern seaboard. We have already observed that the Roman coins held a certain ratio to silver by weight; on the other hand we find those of the east coast of Italy placed in a definite proportional relation to the silver coins which were current from an early period in southern Italy, and the standard of which was adopted by the Italian immigrants, such as the Bruttians, Lucanians, and Nolans, by the Latin colonies in that quarter, such as Cales and Suessa, and even by the Romans themselves for their possessions in Lower Italy. Accordingly the inland traffic of Italy must have been divided into corresponding provinces, which dealt with one another like foreign nations.

Page 401

In transmarine commerce the relations we have previously described(29) between Sicily and Latium, Etruria and Attica, the Adriatic and Tarentum, continued to subsist during the epoch before us or rather, strictly speaking, belonged to it; for although facts of this class, which as a rule are mentioned without a date, have been placed together for the purpose of presenting a general view under the first period, the statements made apply equally to the present. The clearest evidence in this respect is, of course, that of the coins. As the striking of Etruscan silver money after an Attic standard(30) and the penetrating of Italian and especially of Latin copper into Sicily(31) testify to the two former routes of traffic, so the equivalence, which we have just mentioned, between the silver money of Magna Graecia and the copper coinage of Picenum and Apulia, forms, with numerous other indications, an evidence of the active traffic which the Greeks of Lower Italy, the Tarentines in particular, held with the east Italian seaboard. The commerce again, which was at an earlier period perhaps still more active, between the Latins and the Campanian Greeks seems to have been disturbed by the Sabellian immigration, and to have been of no great moment during the first hundred and fifty years of the republic. The refusal of the Samnites in Capua and Cumae to supply the Romans with grain in the famine of 343 may be regarded as an indication of the altered relations which subsisted between Latium and Campania, till at the commencement of the fifth century the Roman arms restored and gave increased impetus to the old intercourse.

Touching on details, we may be allowed to mention, as one of the few dated facts in the history of Roman commerce, the notice drawn from the annals of Ardea, that in 454 the first barber came from Sicily to Ardea; and to dwell for a moment on the painted pottery which was sent chiefly from Attica, but also from Corcyra and Sicily, to Lucania, Campania, and Etruria, to serve there for the decoration of tombs—a traffic, as to the circumstances of which we are accidentally better informed than as to any other article of transmarine commerce. The commencement of this import trade probably falls about the period of the expulsion of the Tarquins; for the vases of the oldest style, which are of very rare occurrence in Italy, were probably painted in the second half of the third century of the city, while those of the chaste style, occurring in greater numbers, belong to the first half, those of the most finished beauty to the second half, of the fourth century; and the immense quantities of the other vases, often marked by showiness and size but seldom by excellence in workmanship, must be assigned as a whole to the following century. It was from the Hellenes undoubtedly that the Italians derived this custom of embellishing tombs; but while the moderate means and fine discernment of the Greeks confined the practice in their case within narrow limits, it

Page 402

was stretched in Italy by barbaric opulence and barbaric extravagance far beyond its original and proper bounds. It is a significant circumstance, however, that in Italy this extravagance meets us only in the lands that had a Hellenic semi-culture. Any one who can read such records will perceive in the cemeteries of Etruria and Campania—the mines whence our museums have been replenished—a significant commentary on the accounts of the ancients as to the Etruscan and Campanian semi-culture choked amidst wealth and arrogance.(32) The homely Samnite character on the other hand remained at all times a stranger to this foolish luxury; the absence of Greek pottery from the tombs exhibits, quite as palpably as the absence of a Samnite coinage, the slight development of commercial intercourse and of urban life in this region. It is still more worthy of remark that Latium also, although not less near to the Greeks than Etruria and Campania, and in closest intercourse with them, almost wholly refrained from such sepulchral decorations. It is more than probable—especially on account of the altogether different character of the tombs in the unique Praeneste—that in this result we have to recognize the influence of the stern Roman morality or—if the expression be preferred—of the rigid Roman police. Closely connected with this subject are the already-mentioned interdicts, which the law of the Twelve Tables fulminated against purple bier-cloths and gold ornaments placed beside the dead; and the banishment of all silver plate, excepting the salt-cellar and sacrificial ladle, from the Roman household, so far at least as sumptuary laws and the terror of censorial censure could banish it: even in architecture we shall again encounter the same spirit of hostility to luxury whether noble or ignoble. Although, however, in consequence of these influences Rome probably preserved a certain outward simplicity longer than Capua and Volsinii, her commerce and trade—on which, in fact, along with agriculture her prosperity from the beginning rested—must not be regarded as having been inconsiderable, or as having less sensibly experienced the influence of her new commanding position.

Capital in Rome

No urban middle class in the proper sense of that term, no body of independent tradesmen and merchants, was ever developed in Rome. The cause of this was—in addition to the disproportionate centralization of capital which occurred at an early period—mainly the employment of slave labour. It was usual in antiquity, and was in fact a necessary consequence of slavery, that the minor trades in towns were very frequently carried on by slaves, whom their master established as artisans or merchants; or by freedmen, in whose case the master not only frequently furnished the capital, but also regularly stipulated for a share, often the half, of the profits. Retail trading and dealing in Rome were undoubtedly constantly on the increase; and there are proofs that

Page 403

the trades which minister to the luxury of great cities began to be concentrated in Rome—the Ficoroni casket for instance was designed in the fifth century of the city by a Praenestine artist and was sold to Praeneste, but was nevertheless manufactured in Rome.(33) But as the net proceeds even of retail business flowed for the most part into the coffers of the great houses, no industrial and commercial middle-class arose to an extent corresponding to that increase. As little were the great merchants and great manufacturers marked off as a distinct class from the great landlords. On the one hand, the latter were from ancient times(34) simultaneously traders and capitalists, and combined in their hands lending on security, trafficking on a great scale, the undertaking of contracts, and the executing of works for the state. On the other hand, from the emphatic moral importance which in the Roman commonwealth attached to the possession of land, and from its constituting the sole basis of political privileges—a basis which was infringed for the first time only towards the close of this epoch (35)—it was undoubtedly at this period already usual for the fortunate speculator to invest part of his capital in land. It is clear enough also from the political privileges given to freedmen possessing freeholds,(36) that the Roman statesmen sought in this way to diminish the dangerous class of the rich who had no land.

Development of Rome as A Great City

But while neither an opulent urban middle class nor a strictly close body of capitalists grew up in Rome, it was constantly acquiring more and more the character of a great city. This is plainly indicated by the increasing number of slaves crowded together in the capital (as attested by the very serious slave conspiracy of 335), and still more by the increasing multitude of freedmen, which was gradually becoming inconvenient and dangerous, as we may safely infer from the considerable tax imposed on manumissions in 397(37) and from the limitation of the political rights of freedmen in 450.(38) For not only was it implied in the circumstances that the great majority of the persons manumitted had to devote themselves to trade or commerce, but manumission itself among the Romans was, as we have already said, less an act of liberality than an industrial speculation, the master often finding it more for his interest to share the profits of the trade or commerce of the freedman than to assert his title to the whole proceeds of the labour of his slave. The increase of manumissions must therefore have necessarily kept pace with the increase of the commercial and industrial activity of the Romans.

Urban Police

Page 404

A similar indication of the rising importance of urban life in Rome is presented by the great development of the urban police. To this period probably belong in great measure the enactments under which the four aediles divided the city into four police districts, and made provision for the discharge of their equally important and difficult functions—for the efficient repair of the network of drains small and large by which Rome was pervaded, as well as of the public buildings and places; for the proper cleansing and paving of the streets; for obviating the nuisances of ruinous buildings, dangerous animals, or foul smells; for the removing of waggons from the highway except during the hours of evening and night, and generally for the keeping open of the communication; for the uninterrupted supply of the market of the capital with good and cheap grain; for the destruction of unwholesome articles, and the suppression of false weights and measures; and for the special oversight of baths, taverns, and houses of bad fame.

Building—
Impulse Given to It

In respect to buildings the regal period, particularly the epoch of the great conquests, probably accomplished more than the first two centuries of the republic. Structures like the temples on the Capitol and on the Aventine and the great Circus were probably as obnoxious to the frugal fathers of the city as to the burgesses who gave their task-work; and it is remarkable that perhaps the most considerable building of the republican period before the Samnite wars, the temple of Ceres in the Circus, was a work of Spurius Cassius (261) who in more than one respect, sought to lead the commonwealth back to the traditions of the kings. The governing aristocracy moreover repressed private luxury with a rigour such as the rule of the kings, if prolonged, would certainly not have displayed. But at length even the senate was no longer able to resist the superior force of circumstances. It was Appius Claudius who in his epoch-making censorship (442) threw aside the antiquated rustic system of parsimonious hoarding, and taught his fellow-citizens to make a worthy use of the public resources. He began that noble system of public works of general utility, which justifies, if anything can justify, the military successes of Rome even from the point of view of the welfare of the nations, and which even now in its ruins furnishes some idea of the greatness of Rome to thousands on thousands who have never read a page of her history. To him the Roman state was indebted for its great military road, and the city of Rome for its first aqueduct. Following in the steps of Claudius, the Roman senate wove around Italy that network of roads and fortresses, the formation of which has already been described,(39) and without which, as the history of all military states from the Achaemenidae down to the creator of the road over the Simplon shows, no military hegemony can subsist. Following in the steps of Claudius,

Page 405

Manius Curius built from the proceeds of the Pyrrhic spoil a second aqueduct for the capital (482); and some years previously (464) with the gains of the Sabine war he opened up for the Velino, at the point above Terni where it falls into the Nera, that broader channel in which the stream still flows, with a view to drain the beautiful valley of Rieti and thereby to gain space for a large burgess settlement along with a modest farm for himself. Such works, in the eyes of persons of intelligence, threw into the shade the aimless magnificence of the Hellenic temples.

Embellishment of the City

The style of living also among the citizens now was altered. About the time of Pyrrhus silver plate began to make its appearance on Roman tables, and the chroniclers date the disappearance of shingle roofs in Rome from 470.(40) The new capital of Italy gradually laid aside its village-like aspect, and now began to embellish itself. It was not yet indeed customary to strip the temples in conquered towns of their ornaments for the decoration of Rome; but the beaks of the galleys of Antium were displayed at the orator's platform in the Forum(41) and on public festival days the gold-mounted shields brought home from the battle-fields of Samnium were exhibited along the stalls of the market.(42) The proceeds of fines were specially applied to the paving of the highways in and near the city, or to the erection and embellishment of public buildings. The wooden booths of the butchers, which stretched along the Forum on both sides, gave way, first on the Palatine side, then on that also which faced the Carinae, to the stone stalls of the money-changers; so that this place became the Exchange of Rome. Statues of the famous men of the past, of the kings, priests, and heroes of the legendary period, and of the Grecian -hospes- who was said to have interpreted to the decemvirs the laws of Solon; honorary columns and monuments dedicated to the great burgomasters who had conquered the Veientes, the Latins, the Samnites, to state envoys who had perished while executing their instructions, to rich women who had bequeathed their property to public objects, nay even to celebrated Greek philosophers and heroes such as Pythagoras and Alcibiades, were erected on the Capitol or in the Forum. Thus, now that the Roman community had become a great power, Rome itself became a great city.

Silver Standard of Value

Lastly Rome, as head of the Romano-Italian confederacy, not only entered into the Hellenistic state-system, but also conformed to the Hellenic system of moneys and coins. Up to this time the different communities of northern and central Italy, with few exceptions, had struck only a copper currency; the south Italian towns again universally had a currency of silver; and there were as many legal standards and systems of coinage as there were sovereign communities in Italy. In 485 all these local mints were restricted

Page 406

to the issuing of small coin; a general standard of currency applicable to all Italy was introduced, and the coining of the currency was centralized in Rome; Capua alone continued to retain its own silver coinage struck in the name of Rome, but after a different standard. The new monetary system was based on the legal ratio subsisting between the two metals, as it had long been fixed.⁽⁴³⁾ The common monetary unit was the piece of ten -asses- (which were no longer of a pound, but reduced to the third of a pound), the -denarius-, which weighed in copper $3 \frac{1}{3}$ and in silver $\frac{1}{72}$, of a Roman pound, a trifle more than the Attic —drachma—. At first copper money still predominated in the coinage; and it is probable that the earliest silver -denarius- was coined chiefly for Lower Italy and for intercourse with other lands. As the victory of the Romans over Pyrrhus and Tarentum and the Roman embassy to Alexandria could not but engage the thoughts of the contemporary Greek statesman, so the sagacious Greek merchant might well ponder as he looked on these new Roman drachmae. Their flat, unartistic, and monotonous stamping appeared poor and insignificant by the side of the marvellously beautiful contemporary coins of Pyrrhus and the Siceliots; nevertheless they were by no means, like the barbarian coins of antiquity, slavishly imitated and unequal in weight and alloy, but, on the contrary, worthy from the first by their independent and conscientious execution to be placed on a level with any Greek coin.

Extension of the Latin Nationality

Thus, when the eye turns from the development of constitutions and from the national struggles for dominion and for freedom which agitated Italy, and Rome in particular, from the banishment of the Tarquinian house to the subjugation of the Samnites and the Italian Greeks, and rests on those calmer spheres of human existence which history nevertheless rules and pervades, it everywhere encounters the reflex influence of the great events, by which the Roman burgesses burst the bonds of patrician sway, and the rich variety of the national cultures of Italy gradually perished to enrich a single people. While the historian may not attempt to follow out the great course of events into the infinite multiplicity of individual detail, he does not overstep his province when, laying hold of detached fragments of scattered tradition, he indicates the most important changes which during this epoch took place in the national life of Italy. That in such an inquiry the life of Rome becomes still more prominent than in the earlier epoch, is not merely the result of the accidental blanks of our tradition; it was an essential consequence of the change in the political position of Rome, that the Latin nationality should more and more cast the other nationalities of Italy into the shade. We have already pointed to the fact, that at this epoch the neighbouring lands—southern Etruria, Sabina, the land of the Volscians, —began

Page 407

to become Romanized, as is attested by the almost total absence of monuments of the old native dialects, and by the occurrence of very ancient Roman inscriptions in those regions; the admission of the Sabines to full burgess-rights at the end of this period⁽⁴⁴⁾ betokens that the Latinizing of Central Italy was already at that time the conscious aim of Roman policy. The numerous individual assignations and colonial establishments scattered throughout Italy were, not only in a military but also in a linguistic and national point of view, the advanced posts of the Latin stock. The Latinizing of the Italians was scarcely at this time generally aimed at; on the contrary, the Roman senate seems to have intentionally upheld the distinction between the Latin and the other nationalities, and they did not yet, for example, allow the introduction of Latin into official use among the half-burgess communities of Campania. The force of circumstances, however, is stronger than even the strongest government: the language and customs of the Latin people immediately shared its predominance in Italy, and already began to undermine the other Italian nationalities.

Progress of Hellenism in Italy— Adoption of Greek Habits at the Table

These nationalities were at the same time assailed from another quarter and by an ascendancy resting on another basis—by Hellenism. This was the period when Hellenism began to become conscious of its intellectual superiority to the other nations, and to diffuse itself on every side. Italy did not remain unaffected by it. The most remarkable phenomenon of this sort is presented by Apulia, which after the fifth century of Rome gradually laid aside its barbarian dialect and silently became Hellenized. This change was brought about, as in Macedonia and Epirus, not by colonization, but by civilization, which seems to have gone hand in hand with the land commerce of Tarentum; at least that hypothesis is favoured by the facts, that the districts of the Poediculi and Daunii who were on friendly terms with the Tarentines carried out their Hellenization more completely than the Sallentines who lived nearer to Tarentum but were constantly at feud with it, and that the towns that were soonest Graecized, such as Arpi, were not situated on the coast. The stronger influence exerted by Hellenism over Apulia than over any other Italian region is explained partly by its position, partly by the slight development of any national culture of its own, and partly also perhaps by its nationality presenting a character less alien to the Greek stock than that of the rest of Italy.⁽⁴⁵⁾ We have already called attention⁽⁴⁶⁾ to the fact that the southern Sabellian stocks, although at the outset in concert with the tyrants of Syracuse they crushed and destroyed the Hellenism of Magna Graecia, were at the same time affected by contact and mingling with the Greeks, so that some of them, such as the Bruttians and Nolans, adopted the Greek language by the side of their native

Page 408

tongue, and others, such as the Lucanians and a part of the Campanians, adopted at least Greek writing and Greek manners. Etruria likewise showed tendencies towards a kindred development in the remarkable vases which have been discovered(47) belonging to this period, rivalling those of Campania and Lucania; and though Latium and Samnium remained more strangers to Hellenism, there were not wanting there also traces of an incipient and ever-growing influence of Greek culture. In all branches of the development of Rome during this epoch, in legislation and coinage, in religion, in the formation of national legend, we encounter traces of the Greeks; and from the commencement of the fifth century in particular, in other words, after the conquest of Campania, the Greek influence on Roman life appears rapidly and constantly on the increase. In the fourth century occurred the erection of the “-Graecostasis”—remarkable in the very form of the word—a platform in the Roman Forum for eminent Greek strangers and primarily for the Massiliots.(48) In the following century the annals began to exhibit Romans of quality with Greek surnames, such as Philipus or in Roman form Pilipus, Philo, Sophus, Hypsaeus. Greek customs gained ground: such as the non-Italian practice of placing inscriptions in honour of the dead on the tomb—of which the epitaph of Lucius Scipio (consul in 456) is the oldest example known to us; the fashion, also foreign to the Italians, of erecting without any decree of the state honorary monuments to ancestors in public places—a system begun by the great innovator Appius Claudius, when he caused bronze shields with images and eulogies of his ancestors to be suspended in the new temple of Bellona (442); the distribution of branches of palms to the competitors, introduced at the Roman national festival in 461; above all, the Greek manners and habits at table. The custom not of sitting as formerly on benches, but of reclining on sofas, at table; the postponement of the chief meal from noon to between two and three o’clock in the afternoon according to our mode of reckoning; the institution of masters of the revels at banquets, who were appointed from among the guests present, generally by throwing the dice, and who then prescribed to the company what, how, and when they should drink; the table-chants sung in succession by the guests, which, however, in Rome were not -scolia-, but lays in praise of ancestors—all these were not primitive customs in Rome, but were borrowed from the Greeks at a very early period, for in Cato’s time these usages were already common and had in fact partly fallen into disuse again. We must therefore place their introduction in this period at the latest. A characteristic feature also was the erection of statues to “the wisest and the bravest Greek” in the Roman Forum, which took place by command of the Pythian Apollo during the Samnite wars. The selection fell—evidently under Sicilian or Campanian influence—on

Page 409

Pythagoras and Alcibiades, the saviour and the Hannibal of the western Hellenes. The extent to which an acquaintance with Greek was already diffused in the fifth century among Romans of quality is shown by the embassies of the Romans to Tarentum—when their mouthpiece spoke, if not in the purest Greek, at any rate without an interpreter—and of Cineas to Rome. It scarcely admits of a doubt that from the fifth century the young Romans who devoted themselves to state affairs universally acquired a knowledge of what was then the general language of the world and of diplomacy.

Thus in the intellectual sphere Hellenism made advances quite as incessant as the efforts of the Romans to subject the earth to their sway; and the secondary nationalities, such as the Samnite, Celt, and Etruscan, hard pressed on both sides, were ever losing their inward vigour as well as narrowing their outward bounds.

Rome and the Romans of This Epoch

When the two great nations, both arrived at the height of their development, began to mingle in hostile or in friendly contact, their antagonism of character was at the same time prominently and fully brought out—the total want of individuality in the Italian and especially in the Roman character, as contrasted with the boundless variety, lineal, local, and personal, of Hellenism. There was no epoch of mightier vigour in the history of Rome than the epoch from the institution of the republic to the subjugation of Italy. That epoch laid the foundations of the commonwealth both within and without; it created a united Italy; it gave birth to the traditional groundwork of the national law and of the national history; it originated the -pilum- and the manipule, the construction of roads and of aqueducts, the farming of estates and the monetary system; it moulded the she-wolf of the Capitol and designed the Ficoroni casket. But the individuals, who contributed the several stones to this gigantic structure and cemented them together, have disappeared without leaving a trace, and the nations of Italy did not merge into that of Rome more completely than the single Roman burgess merged in the Roman community. As the grave closes alike over all whether important or insignificant, so in the roll of the Roman burgomasters the empty scion of nobility stands undistinguishable by the side of the great statesman. Of the few records that have reached us from this period none is more venerable, and none at the same time more characteristic, than the epitaph of Lucius Cornelius Scipio, who was consul in 456, and three years afterwards took part in the decisive battle of Sentinum.(49) On the beautiful sarcophagus, in noble Doric style, which eighty years ago still enclosed the dust of the conqueror of the Samnites, the following sentence is inscribed:—

-Cornelius Lucius—Scipio Barbatus,
Gnaivod patre prognatus, —fortis vir sapiensque,
Quoius forma virtu—tei parisuma fuit,
Consol censor aidilis—quei fuit apud vos,

Taurasia Cisauna—Samnio cepit,
Subigit omne Loucanum—opsidesque abdoucit.-

Page 410

—'—'—'—||—'—'—'—

Innumerable others who had been at the head of the Roman commonwealth, as well as this Roman statesman and warrior, might be commemorated as having been of noble birth and of manly beauty, valiant and wise; but there was no more to record regarding them. It is doubtless not the mere fault of tradition that no one of these Cornelii, Fabii, Papirii, or whatever they were called, confronts us in a distinct individual figure. The senator was supposed to be no worse and no better than other senators, nor at all to differ from them. It was not necessary and not desirable that any burgess should surpass the rest, whether by showy silver plate and Hellenic culture, or by uncommon wisdom and excellence. Excesses of the former kind were punished by the censor, and for the latter the constitution gave no scope. The Rome of this period belonged to no individual; it was necessary for all the burgesses to be alike, that each of them might be like a king.

Appius Claudius

No doubt, even now Hellenic individual development asserted its claims by the side of that levelling system; and the genius and force which it exhibited bear, no less than the tendency to which it opposed itself, the full stamp of that great age. We can name but a single man in connection with it; but he was, as it were, the incarnation of the idea of progress. Appius Claudius (censor 442; consul 447, 458), the great-great-grandson of the decemvir, was a man of the old nobility and proud of the long line of his ancestors; but yet it was he who set aside the restriction which confined the full franchise of the state to the freeholders,(50) and who broke up the old system of finance.(51) From Appius Claudius date not only the Roman aqueducts and highways, but also Roman jurisprudence, eloquence, poetry, and grammar. The publication of a table of the -legis actiones-, speeches committed to writing and Pythagorean sentences, and even innovations in orthography, are attributed to him. We may not on this account call him absolutely a democrat or include him in that opposition party which found its champion in Manius Curius;(52) in him on the contrary the spirit of the ancient and modern patrician kings predominated —the spirit of the Tarquins and the Caesars, between whom he forms a connecting link in that five hundred years' interregnum of extraordinary deeds and ordinary men. So long as Appius Claudius took an active part in public life, in his official conduct as well as his general carriage he disregarded laws and customs on all hands with the hardihood and sauciness of an Athenian; till, after having long retired from the political stage, the blind old man, returning as it were from the tomb at the decisive Moment, overcame king Pyrrhus in the senate, and first formally and solemnly proclaimed the complete sovereignty of Rome over Italy.(53) But the gifted man came too early or too late; the gods made him blind on account of his untimely wisdom.

Page 411

It was not individual genius that ruled in Rome and through Rome in Italy; it was the one immoveable idea of a policy—propagated from generation to generation in the senate—with the leading maxims of which the sons of the senators became already imbued, when in the company of their fathers they went to the council and there at the door of the hall listened to the wisdom of the men whose seats they were destined at some future time to fill. Immense successes were thus obtained at an immense price; for Nike too is followed by her Nemesis. In the Roman commonwealth there was no special dependence on any one man, either on soldier or on general, and under the rigid discipline of its moral police all the idiosyncrasies of human character were extinguished. Rome reached a greatness such as no other state of antiquity attained; but she dearly purchased her greatness at the sacrifice of the graceful variety, of the easy abandon and of the inward freedom of Hellenic life.

9. II. III. Praetorship
10. II. III. Praetorship, *ii*. V. Revision of the Municipal Constitutions, Police Judges
11. The view formerly adopted, that these -tres viri- belonged to the earliest period, is erroneous, for colleges of magistrates with odd numbers are foreign to the oldest state-arrangements (Chronol. p. 15, note 12). Probably the well-accredited account, that they were first nominated in 465 (Liv. Ep. 11), should simply be retained, and the otherwise suspicious inference of the falsifier Licinius Macer (in Liv. vii. 46), which makes mention of them before 450, should be simply rejected. At first undoubtedly the -tres viri- were

nominated by the superior magistrates, as was the case with most of the later -magistratus minores-; the Papirian -plebiscitum-, which transferred the nomination of them to the community (Festus, -v. sacramentum-, p. 344, Niall.), was at any rate not issued till after the institution of the office of -praetor peregrinus-, or at the earliest towards the middle of the sixth century, for it names the praetor -qui inter jus cives ius dicit-.

12. II. VII. Subject Communities

13. This inference is suggested by what Livy says (ix. 20) as to the reorganization of the colony of Antium twenty years after it was founded; and it is self-evident that, while the Romans might very well impose on the inhabitant of Ostia the duty of settling all his lawsuits in Rome, the same course could not be followed with townships like Antium and Sena.

Page 412

14. II. I. Restrictions on the Delegation of Powers

15. People are in the habit of praising the Romans as a nation specially privileged in respect to jurisprudence, and of gazing with wonder on their admirable law as a mystical gift of heaven; presumably by way of specially excusing themselves for the worthlessness of their own legal system. A glance at the singularly fluctuating and undeveloped criminal law of the Romans might show the untenableness of ideas so confused even to those who may think the proposition too simple, that a sound people has a sound law, and a morbid people an unsound. Apart from the more general political conditions on which jurisprudence also, and indeed jurisprudence especially, depends, the causes of the excellence of the Roman civil law lie mainly in two features: first, that the plaintiff and defendant were specially obliged to explain and embody in due and binding form the grounds of the demand and of the objection to comply with it; and secondly, that the Romans appointed a permanent machinery for the edictal development of their law, and associated it immediately with practice. By the former the Romans precluded the pettifogging practices of advocates, by the latter they obviated incapable law-making, so far as such things can be prevented at all; and by means of both in conjunction they satisfied, as far as is possible, the two conflicting requirements, that law shall constantly be fixed, and that it shall constantly be in accordance with the spirit of the age.

16. II. II. Relation of the Tribune to the Consul

17. V. V. The Hegemony of Rome over Latium Shaken and Re-established

18. Venus probably first appears in the later sense as Aphrodite on occasion of the dedication of the temple consecrated in this year (Liv. x. 31; Becker, *Topographie*, p. 472).

19. II. III. Intrigues of the Nobility

20. I. Vi. Organization of the Army

21. II. III. Increasing Powers of the Burgesses

22. I. Vi. the Five Classes

23. According to Roman tradition the Romans originally carried quadrangular shields, after which they borrowed from the Etruscans the round hoplite shield (-clupeus-, —aspis—), and from the Samnites the later square shield (-scutum-, —thureos—), and the javelin (-veru-) (Diodor. Vat. Fr. p. 54; Sallust, Cat. 51, 38; Virgil, Aen. vii. 665; Festus, Ep. v. Samnites, p. 327, Mull.; and the authorities cited in Marquardt, *Handb.* iii. 2, 241). But it may be regarded as certain that the hoplite shield or, in other words, the tactics of the Doric phalanx were imitated not from the Etruscans, but directly from the

Hellenes, As to the -scutum-, that large, cylindrical, convex leather shield must certainly have taken the place of the flat copper -clupeus-, when the phalanx was broken up into maniples; but the undoubted derivation of the word from the Greek casts suspicion on the derivation of the thing itself from the Samnites. From the Greeks the Romans derived also the sling (-funda- from —sphendone—). (like -fides- from —sphion—), (I. XV. Earliest Hellenic Influences). The pilum was considered by the ancients as quite a Roman invention.

CHAPTER IX

Art and Science

The Roman National Festival— The Roman Stage

Page 414

The growth of art, and of poetic art especially, in antiquity was intimately associated with the development of national festivals. The thanksgiving-festival of the Roman community, which had been already organized in the previous period essentially under Greek influence and in the first instance as an extraordinary festival, —the -ludi maximi- or -Romani-,⁽¹⁾ —acquired during the present epoch a longer duration and greater variety in the amusements. Originally limited to one day, the festival was prolonged by an additional day after the happy termination of each of the three great revolutions of 245, 260, and 387, and thus at the close of this period it had already a duration of four days.⁽²⁾

A still more important circumstance was, that, probably on the institution of the curule aedileship (387) which was from the first entrusted with the preparation and oversight of the festival,⁽³⁾ it lost its extraordinary character and its reference to a special vow made by the general, and took its place in the series of the ordinary annually recurring festivals as the first of all. Nevertheless the government adhered to the practice of allowing the spectacle proper —namely the chariot-race, which was the principal performance—to take place not more than once at the close of the festival. On the other days the multitude were probably left mainly to furnish amusement for themselves, although musicians, dancers, rope-walkers, jugglers, jesters and such like would not fail to make their appearance on the occasion, whether hired or not. But about the year 390 an important change occurred, which must have stood in connection with the fixing and prolongation of the festival, that took place perhaps about the same time. A scaffolding of boards was erected at the expense of the state in the Circus for the first three days, and suitable representations were provided on it for the entertainment of the multitude. That matters might not be carried too far however in this way, a fixed sum of 200,000 -asses- (2055 pounds) once for all appropriated from the exchequer for the expenses of the festival; and the sum was not increased up to the period of the Punic wars. The aediles, who had to expend this sum, were obliged to defray any additional amount out of their own pockets; and it is not probable that they at this time contributed often or considerably from their own resources. That the new stage was generally under Greek influence, is proved by its very name (-scaena-, —skene—). It was no doubt at first designed merely for musicians and buffoons of all sorts, amongst whom the dancers to the flute, particularly those then so celebrated from Etruria, were probably the most distinguished; but a public stage had at any rate now arisen in Rome and it soon became open also to the Roman poets.

Ballad Singers, -Satura- —
Censure of Art

Page 415

There was no want of such poets in Latium. Latin “strolling minstrels” or “ballad-singers” (-grassatores-, -spatiatores-) went from town to town and from house to house, and recited their chants (-saturae-(4)), gesticulating and dancing to the accompaniment of the flute. The measure was of course the only one that then existed, the so-called Saturnian.(5) No distinct plot lay at the basis of the chants, and as little do they appear to have been in the form of dialogue. We must conceive of them as resembling those monotonous —sometimes improvised, sometimes recited—ballads and -tarantelle-, such as one may still hear in the Roman hostelryes. Songs of this sort accordingly early came upon the public stage, and certainly formed the first nucleus of the Roman theatre. But not only were these beginnings of the drama in Rome, as everywhere, modest and humble; they were, in a remarkable manner, accounted from the very outset disreputable. The Twelve Tables denounced evil and worthless song-singing, imposing severe penalties not only upon incantations but even on lampoons composed against a fellow-citizen or recited before his door, and forbidding the employment of wailing-women at funerals. But far more severely, than by such legal restrictions, the incipient exercise of art was affected by the moral anathema, which was denounced against these frivolous and paid trades by the narrowminded earnestness of the Roman character. “The trade of a poet,” says Cato, “in former times was not respected; if any one occupied himself with it or was a hanger-on at banquets, he was called an idler.” But now any one who practised dancing, music, or ballad-singing for money was visited with a double stigma, in consequence of the more and more confirmed disapproval of gaining a livelihood by services rendered for remuneration. While accordingly the taking part in the masked farces with stereotyped characters, that formed the usual native amusement,(6) was looked upon as an innocent youthful frolic, the appearing on a public stage for money and without a mask was considered as directly infamous, and the singer and poet were in this respect placed quite on a level with the rope-dancer and the harlequin. Persons of this stamp were regularly pronounced by the censors(7) incapable of serving in the burgess-army and of voting in the burgess-assembly. Moreover, not only was the direction of the stage regarded as pertaining to the province of the city police—a fact significant enough even in itself—but the police was probably, even at this period, invested with arbitrary powers of an extraordinary character against professional stage-artists. Not only did the police magistrates sit in judgment on the performance after its conclusion—on which occasion wine flowed as copiously for those who had acquitted themselves well, as stripes fell to the lot of the bungler—but all the urban magistrates were legally entitled to inflict bodily chastisement and imprisonment on any actor at any

Page 416

time and at any place. The necessary effect of this was that dancing, music, and poetry, at least so far as they appeared on the public stage, fell into the hands of the lowest classes of the Roman burgesses, and especially into those of foreigners; and while at this period poetry still played altogether too insignificant a part to engage the attention of foreign artists, the statement on the other hand, that in Rome all the music, sacred and profane, was essentially Etruscan, and consequently the ancient Latin art of the flute, which was evidently at one time held in high esteem,(8) had been supplanted by foreign music, may be regarded as already applicable to this period.

There is no mention of any poetical literature. Neither the masked plays nor the recitations of the stage can have had in the proper sense fixed texts; on the contrary, they were ordinarily improvised by the performers themselves as circumstances required. Of works composed at this period posterity could point to nothing but a sort of Roman "Works and Days"—counsels of a farmer to his son,(9) and the already-mentioned Pythagorean poems of Appius Claudius(10) the first commencement of Roman poetry after the Hellenic type. Nothing of the poems of this epoch has survived but one or two epitaphs in Saturnian measure.(11)

Roman Historical Composition

Along with the rudiments of the Roman drama, the rudiments of Roman historical composition belong to this period; both as regards the contemporary recording of remarkable events, and as regards the conventional settlement of the early history of the Roman community.

Registers of Magistrates

The writing of contemporary history was associated with the register of the magistrates. The register reaching farthest back, which was accessible to the later Roman inquirers and is still indirectly accessible to us, seems to have been derived from the archives of the temple of the Capitoline Jupiter; for it records the names of the annual presidents of the community onward from the consul Marcus Horatius, who consecrated that temple on the 13th Sept. in his year of office, and it also notices the vow which was made on occasion of a severe pestilence under the consuls Publius Servilius and Lucius Aebutius (according to the reckoning now current, 291), that thenceforward a nail should be driven every hundredth year into the wall of the Capitoline temple. Subsequently it was the state officials who were learned in measuring and in writing, or in other words, the pontifices, that kept an official record of the names of the annual chief magistrates, and thus combined an annual, with the earlier monthly, calendar. Both these calendars were afterwards comprehended under the name of Fasti—which strictly belonged only to the list of court-days. This arrangement was probably adopted not long after the abolition of

the monarchy; for in fact an official record of the annual magistrates was of urgent practical

Page 417

necessity for the purpose of authenticating the order of succession of official documents. But, if there was an official register of the consuls so old, it probably perished in the Gallic conflagration (364); and the list of the pontifical college was subsequently completed from the Capitoline register which was not affected by that catastrophe, so far as this latter reached back. That the list of presidents which we now have —although in collateral matters, and especially in genealogical statements, it has been supplemented at pleasure from the family pedigrees of the nobility—is in substance based from the beginning on contemporary and credible records, admits of no doubt. But it reproduces the calendar years only imperfectly and approximately: for the consuls did not enter on office with the new year, or even on a definite day fixed once for all; on the contrary from various causes the day of entering on office was fluctuating, and the -interregna-that frequently occurred between two consulates were entirely omitted in the reckoning by official years. Accordingly, if the calendar years were to be reckoned by this list of consuls, it was necessary to note the days of entering on and of demitting office in the case of each pair, along with such -interregna- as occurred; and this too may have been early done. But besides this, the list of the annual magistrates was adjusted to the list of calendar years in such a way that a pair of magistrates were by accommodation assigned to each calendar year, and, where the list did not suffice, intercalary years were inserted, which are denoted in the later (Varronian) table by the figures 379, 383, 421, 430, 445, 453. From 291 u. c. (463 B. C.) the Roman list demonstrably coincides, not indeed in detail but yet on the whole, with the Roman calendar, and is thus chronologically certain, so far as the defectiveness of the calendar itself allows. The 47 years preceding that date cannot be checked, but must likewise be at least in the main correct.(12) Whatever lies beyond 245 remains, chronologically, in oblivion.

Capitoline Era

No era was formed for ordinary use; but in ritual matters they reckoned from the year of the consecration of the temple of the Capitoline Jupiter, from which the list of magistrates also started.

Annals

The idea naturally suggested itself that, along with the names of the magistrates, the most important events occurring under their magistracy might be noted; and from such notices appended to the catalogue of magistrates the Roman annals arose, just as the chronicles of the middle ages arose out of the memoranda marginally appended to the table of Easter. But it was not until a late period that the pontifices formed the scheme of a formal chronicle (-liber annalis-), which should steadily year by year record the names of all the magistrates and the remarkable events. Before the eclipse of the sun noticed under the 5th of June

Page 418

351, by which is probably meant that of the 20th June 354, no solar eclipse was found recorded from observation in the later chronicle of the city: its statements as to the numbers of the census only begin to sound credible after the beginning of the fifth century,(13) the cases of fines brought before the people, and the prodigies expiated on behalf of the community, appear to have been regularly introduced into the annals only after the second half of the fifth century began. To all appearance the institution of an organized book of annals, and—what was certainly associated with it—the revision (which we have just explained) of the earlier list of magistrates so as to make it a year-calendar by the insertion, where chronologically necessary, of intercalary years, took place in the first half of the fifth century. But even after it became a practically recognized duty of the -pontifex maximus- to record year after year campaigns and colonizations, pestilences and famines, eclipses and portents, the deaths of priests and other men of note, the new decrees of the people, and the results of the census, and to deposit these records in his official residence for permanent preservation and for any one's inspection, these records were still far removed from the character of real historical writings. How scanty the contemporary record still was at the close of this period and how ample room is left for the caprice of subsequent annalists, is shown with incisive clearness by a comparison of the accounts as to the campaign of 456 in the annals and in the epitaph of the consul Scipio.(14) The later historians were evidently unable to construct a readable and in some measure connected narrative out of these notices from the book of annals; and we should have difficulty, even if the book of annals still lay before us with its original contents, in writing from it in duly connected sequence the history of the times. Such chronicles, however, did not exist merely in Rome; every Latin city possessed its annals as well as its pontifices, as is clear from isolated notices relative to Ardea for instance, Ameria, and Interamna on the Nar; and from the collective mass of these city-chronicles some result might perhaps have been attained similar to what has been accomplished for the earlier middle ages by the comparison of different monastic chronicles. Unfortunately the Romans in later times preferred to supply the defect by Hellenic or Hellenizing falsehoods.

Family Pedigrees

Besides these official arrangements, meagrely planned and uncertainly handled, for commemorating past times and past events, there can scarcely have existed at this epoch any other records immediately serviceable for Roman history. Of private chronicles we find no trace. The leading houses, however, were careful to draw up genealogical tables, so important in a legal point of view, and to have the family pedigree painted for a perpetual memorial on the walls of the

Page 419

entrance-hall. These lists, which at least named the magistracies held by the family, not only furnished a basis for family tradition, but doubtless at an early period had biographical notices attached to them. The memorial orations, which in Rome could not be omitted at the funeral of any person of quality, and were ordinarily pronounced by the nearest relative of the deceased, consisted essentially not merely in an enumeration of the virtues and excellencies of the dead, but also in a recital of the deeds and virtues of his ancestors; and so they were doubtless, even in the earliest times, transmitted traditionally from one generation to another. Many a valuable notice may by this means have been preserved; but many a daring perversion and falsification also may have been in this way introduced into tradition.

Roman Early History of Rome

But as the first steps towards writing real history belonged to this period, to it belonged also the first attempts to record, and conventionally distort, the primitive history of Rome. The sources whence it was formed were of course the same as they are everywhere. Isolated names like those of the kings Numa, Ancus, Tullus, to whom the clan-names were probably only assigned subsequently, and isolated facts, such as the conquest of the Latins by king Tarquinius and the expulsion of the Tarquinian royal house, may have continued to live in true general tradition orally transmitted. Further materials were furnished by the traditions of the patrician clans, such as the various tales that relate to the Fabii. Other tales gave a symbolic and historic shape to primitive national institutions, especially setting forth with great vividness the origin of rules of law. The sacredness of the walls was thus illustrated in the tale of the death of Remus, the abolition of blood-revenge in the tale of the end of king Tatius⁽¹⁵⁾, the necessity of the arrangement as to the -pons sublicius- in the legend of Horatius Cocles,⁽¹⁵⁾ the origin of the -provocatio- in the beautiful tale of the Horatii and Curiatii, the origin of manumission and of the burgess-rights of freedmen in the tale of the Tarquinian conspiracy and the slave Vindicius. To the same class belongs the history of the foundation of the city itself, which was designed to connect the origin of Rome with Latium and with Alba, the general metropolis of the Latins. Historical glosses were annexed to the surnames of distinguished Romans; that of Publius Valerius the "servant of the people" (-Poplicola-), for instance, gathered around it a whole group of such anecdotes. Above all, the sacred fig-tree and other spots and notable objects in the city were associated with a great multitude of sextons' tales of the same nature as those out of which, upwards of a thousand years afterwards, there grew up on the same ground the *Mirabilia Urbis*. Some attempts to link together these different tales—the adjustment of the series of the seven kings, the setting

Page 420

down of the duration of the monarchy at 240 years in all, which was undoubtedly based on a calculation of the length of generations,(16) and even the commencement of an official record of these assumed facts—probably took place already in this epoch. The outlines of the narrative, and in particular its quasi-chronology, make their appearance in the later tradition so unalterably fixed, that for that very reason the fixing of them must be placed not in, but previous to, the literary epoch of Rome. If a bronze casting of the twins Romulus and Remus sucking the teats of the she-wolf was already placed beside the sacred fig-tree in 458, the Romans who subdued Latium and Samnium must have heard the history of the origin of their ancestral city in a form not greatly differing from what we read in Livy. Even the Aborigines—i. e. “those from the very beginning”—that simple rudimental form of historical speculation as to the Latin race—are met with about 465 in the Sicilian author Callias. It is of the very nature of a chronicle that it should attach prehistoric speculation to history and endeavour to go back, if not to the origin of heaven and earth, at least to the origin of the community; and there is express testimony that the table of the pontifices specified the year of the foundation of Rome. Accordingly it may be assumed that, when the pontifical college in the first half of the fifth century proceeded to substitute for the former scanty records—ordinarily, doubtless, confined to the names of the magistrates—the scheme of a formal yearly chronicle, it also added what was wanting at the beginning, the history of the kings of Rome and of their fall, and, by placing the institution of the republic on the day of the consecration of the Capitoline temple, the 13th of Sept. 245, furnished a semblance of connection between the dateless and the annalistic narrative. That in this earliest record of the origin of Rome the hand of Hellenism was at work, can scarcely be doubted. The speculations as to the primitive and subsequent population, as to the priority of pastoral life over agriculture, and the transformation of the man Romulus into the god Quirinus,(17) have quite a Greek aspect, and even the obscuring of the genuinely national forms of the pious Numa and the wise Egeria by the admixture of alien elements of Pythagorean primitive wisdom appears by no means to be one of the most recent ingredients in the Roman prehistoric annals.

The pedigrees of the noble clans were completed in a manner analogous to these -origines- of the community, and were, in the favourite style of heraldry, universally traced back to illustrious ancestors. The Aemilii, for instance, Calpurnii, Pinarii, and Pomponii professed to be descended from the four sons of Numa, Mamercus, Calpus, Pinus, and Pompo; and the Aemilii, yet further, from Mamercus, the son of Pythagoras, who was named the “winning speaker” (—aimulos—)

But, notwithstanding the Hellenic reminiscences that are everywhere apparent, these prehistoric annals of the community and of the leading houses may be designated at least relatively as national, partly because they originated in Rome, partly because they tended primarily to form links of connection not between Rome and Greece, but between Rome and Latium.

Page 421

Hellenic Early History of Rome

It was Hellenic story and fiction that undertook the task of connecting Rome and Greece. Hellenic legend exhibits throughout an endeavour to keep pace with the gradual extension of geographical knowledge, and to form a dramatized geography by the aid of its numerous stories of voyagers and emigrants. In this, however, it seldom follows a simple course. An account like that of the earliest Greek historical work which mentions Rome, the “Sicilian History” of Antiochus of Syracuse (which ended in 330)—that a man named Sikelos had migrated from Rome to Italia, that is, to the Bruttian peninsula—such an account, simply giving a historical form to the family affinity between the Romans, Siculi, and Bruttians, and free from all Hellenizing colouring, is a rare phenomenon. Greek legend as a whole is pervaded—and the more so, the later its rise—by a tendency to represent the whole barbarian world as having either issued from the Greeks or having been subdued by them; and it early in this sense spun its threads also around the west. For Italy the legends of Herakles and of the Argonauts were of less importance—although Hecataeus (after 257) is already acquainted with the Pillars of Herakles, and carries the Argo from the Black Sea into the Atlantic Ocean, from the latter into the Nile, and thus back to the Mediterranean—than were the homeward voyages connected with the fall of Ilion. With the first dawn of information as to Italy Diomedes begins to wander in the Adriatic, and Odysseus in the Tyrrhene Sea;(18) as indeed the latter localization at least was naturally suggested by the Homeric conception of the legend. Down to the times of Alexander the countries on the Tyrrhene Sea belonged in Hellenic fable to the domain of the legend of Odysseus; Ephorus, who ended his history with the year 414, and the so-called Scylax (about 418) still substantially follow it. Of Trojan voyages the whole earlier poetry has no knowledge; in Homer Aeneas after the fall of Ilion rules over the Trojans that remained at home.

Stesichorus

It was the great remodeller of myths, Stesichorus (122-201) who first in his “Destruction of Ilion” brought Aeneas to the land of the west, that he might poetically enrich the world of fable in the country of his birth and of his adoption, Sicily and Lower Italy, by the contrast of the Trojan heroes with the Hellenic. With him originated the poetical outlines of this fable as thenceforward fixed, especially the group of the hero and his wife, his little son and his aged father bearing the household gods, departing from burning Troy, and the important identification of the Trojans with the Sicilian and Italian autochthones, which is especially apparent in the case of the Trojan trumpeter Misenus who gave his name to the promontory of Misenum.(19) The old poet was guided in this view by the feeling that the barbarians of Italy were less widely removed from the Hellenes than other barbarians

Page 422

were, and that the relation between the Hellenes and Italians might, when measured poetically, be conceived as similar to that between the Homeric Achaeans and the Trojans. This new Trojan fable soon came to be mixed up with the earlier legend of Odysseus, while it spread at the same time more widely over Italy. According to Hellanicus (who wrote about 350) Odysseus and Aeneas came through the country of the Thracians and Molottians (Epirus) to Italy, where the Trojan women whom they had brought with them burnt the ships, and Aeneas founded the city of Rome and named it after one of these Trojan women. To a similar effect, only with less absurdity, Aristotle (370-432) related that an Achaean squadron cast upon the Latin coast had been set on fire by Trojan female slaves, and that the Latins had originated from the descendants of the Achaeans who were thus compelled to remain there and of their Trojan wives. With these tales were next mingled elements from the indigenous legend, the knowledge of which had been diffused as far as Sicily by the active intercourse between Sicily and Italy, at least towards the end of this epoch. In the version of the origin of Rome, which the Sicilian Callias put on record about 465, the fables of Odysseus, Aeneas, and Romulus were intermingled.(20)

Timaeus

But the person who really completed the conception subsequently current of this Trojan migration was Timaeus of Tauromenium in Sicily, who concluded his historical work with 492. It is he who represents Aeneas as first founding Lavinium with its shrine of the Trojan Penates, and as thereafter founding Rome; he must also have interwoven the Tyrian princess Elisa or Dido with the legend of Aeneas, for with him Dido is the foundress of Carthage, and Rome and Carthage are said by him to have been built in the same year. These alterations were manifestly suggested by certain accounts that had reached Sicily respecting Latin manners and customs, in conjunction with the critical struggle which at the very time and place where Timaeus wrote was preparing between the Romans and the Carthaginians. In the main, however, the story cannot have been derived from Latium, but can only have been the good-for-nothing invention of the old "gossip-monger" himself. Timaeus had heard of the primitive temple of the household gods in Lavinium; but the statement, that these were regarded by the Lavinates as the Penates brought by the followers of Aeneas from Ilion, is as certainly an addition of his own, as the ingenious parallel between the Roman October horse and the Trojan horse, and the exact inventory taken of the sacred objects of Lavinium—there were, our worthy author affirms, heralds' staves of iron and copper, and an earthen vase of Trojan manufacture! It is true that these same Penates might not at all be seen by any one for centuries afterwards; but Timaeus was one of the historians who upon no matter are so fully informed as upon things unknowable. It

Page 423

is not without reason that Polybius, who knew the man, advises that he should in no case be trusted, and least of all where, as in this instance, he appeals to documentary proofs. In fact the Sicilian rhetorician, who professed to point out the grave of Thucydides in Italy, and who found no higher praise for Alexander than that he had finished the conquest of Asia sooner than Isocrates finished his "Panegyric," was exactly the man to knead the naive fictions of the earlier time into that confused medley on which the play of accident has conferred so singular a celebrity.

How far the Hellenic play of fable regarding Italian matters, as it in the first instance arose in Sicily, gained admission during this period even in Italy itself, cannot be ascertained with precision. Those links of connection with the Odyssean cycle, which we subsequently meet with in the legends of the foundation of Tusculum, Praeneste, Antium, Ardea, and Cortona, must probably have been already concocted at this period; and even the belief in the descent of the Romans from Trojan men or Trojan women must have been established at the close of this epoch in Rome, for the first demonstrable contact between Rome and the Greek east is the intercession of the senate on behalf of the "kindre" Ilians in 472. That the fable of Aeneas was nevertheless of comparatively recent origin in Italy, is shown by the extremely scanty measure of its localization as compared with the legend of Odysseus; and at any rate the final redaction of these tales, as well as their reconciliation with the legend of the origin of Rome, belongs only to the following age.

While in this way historical composition, or what was so called among the Hellenes, busied itself in its own fashion with the prehistoric times of Italy, it left the contemporary history of Italy almost untouched—a circumstance as significant of the sunken condition of Hellenic history, as it is to be for our sakes regretted. Theopompus of Chios (who ended his work with 418) barely noticed in passing the capture of Rome by the Celts; and Aristotle,(21) Clitarchus,(22) Theophrastus,(23) Heraclides of Pontus (about 450), incidentally mention particular events relating to Rome. It is only with Hieronymus of Cardia, who as the historian of Pyrrhus narrated also his Italian wars, that Greek historiography becomes at the same time an authority for the history of Rome.

Jurisprudence

Among the sciences, that of jurisprudence acquired an invaluable basis through the committing to writing of the laws of the city in the years 303, 304. This code, known under the name of the Twelve Tables, is perhaps the oldest Roman document that deserves the name of a book. The nucleus of the so-called *-leges regiae-* was probably not much more recent. These were certain precepts chiefly of a ritual nature, which rested upon traditional usage, and were probably promulgated to the general public under the form of royal enactments by the college of pontifices, which was entitled not to legislate but to point out the law. Moreover it may be presumed that from the

commencement of this period the more important decrees of the senate at any rate—if not those of the people—were regularly recorded in writing; for already in the earliest conflicts between the orders disputes took place as to their preservation.(24)

Page 424

Opinions—
Table of Formulae for Actions

While the mass of written legal documents thus increased, the foundations of jurisprudence in the proper sense were also firmly laid. It was necessary that both the magistrates who were annually changed and the jurymen taken from the people should be enabled to resort to men of skill, who were acquainted with the course of law and knew how to suggest a decision accordant with precedents or, in the absence of these, resting on reasonable grounds. The pontifices who were wont to be consulted by the people regarding court-days and on all questions of difficulty and of legal observance relating to the worship of the gods, delivered also, when asked, counsels and opinions on other points of law, and thus developed in the bosom of their college that tradition which formed the basis of Roman private law, more especially the formulae of action proper for each particular case. A table of formulae which embraced all these actions, along with a calendar which specified the court-days, was published to the people about 450 by Appius Claudius or by his clerk, Gnaeus Flavius. This attempt, however, to give formal shape to a science, that as yet hardly recognized itself, stood for a long time completely isolated.

That the knowledge of law and the setting it forth were even now a means of recommendation to the people and of attaining offices of state, may be readily conceived, although the story, that the first plebeian pontifex Publius Sempronius Sophus (consul 450), and the first plebeian pontifex maximus Tiberius Coruncanius (consul 474), were indebted for these priestly honours to their knowledge of law, is probably rather a conjecture of posterity than a statement of tradition.

Language

That the real genesis of the Latin and doubtless also of the other Italian languages was anterior to this period, and that even at its commencement the Latin language was substantially an accomplished fact, is evident from the fragments of the Twelve Tables, which, however, have been largely modernized by their semi-oral tradition. They contain doubtless a number of antiquated words and harsh combinations, particularly in consequence of omitting the indefinite subject; but their meaning by no means presents, like that of the Arval chant, any real difficulty, and they exhibit far more agreement with the language of Cato than with that of the ancient litanies. If the Romans at the beginning of the seventh century had difficulty in understanding documents of the fifth, the difficulty doubtless proceeded merely from the fact that there existed at that time in Rome no real, least of all any documentary, research.

Technical Style

On the other hand it must have been at this period, when the indication and redaction of law began, that the Roman technical style first established itself—a style which at least

in its developed shape is nowise inferior to the modern legal phraseology of England in stereotyped formulae and turns of expression, endless enumeration of particulars, and long-winded periods; and which commends itself to the initiated by its clearness and precision, while the layman who does not understand it listens, according to his character and humour, with reverence, impatience, or chagrin.

Page 425

Philology

Moreover at this epoch began the treatment of the native languages after a rational method. About its commencement the Sabellian as well as the Latin idiom threatened, as we saw,(25) to become barbarous, and the abrasion of endings and the corruption of the vowels and more delicate consonants spread on all hands, just as was the case with the Romanic languages in the fifth and sixth centuries of the Christian era. But a reaction set in: the sounds which had coalesced in Oscan, -d and -r, and the sounds which had coalesced in Latin, -g and -k, were again separated, and each was provided with its proper sign; -o and -u, for which from the first the Oscan alphabet had lacked separate signs, and which had been in Latin originally separate but threatened to coalesce, again became distinct, and in Oscan even the -i was resolved into two signs different in sound and in writing; lastly, the writing again came to follow more closely the pronunciation—the -s for instance among the Romans being in many cases replaced by -r. Chronological indications point to the fifth century as the period of this reaction; the Latin -g for instance was not yet in existence about 300 but was so probably about 500; the first of the Papirian clan, who called himself Papirius instead of Papisius, was the consul of 418; the introduction of that -r instead of -s is attributed to Appius Claudius, censor in 442. Beyond doubt the re-introduction of a more delicate and precise pronunciation was connected with the increasing influence of Greek civilization, which is observable at this very period in all departments of Italian life; and, as the silver coins of Capua and Nola are far more perfect than the contemporary asses of Ardea and Rome, writing and language appear also to have been more speedily and fully reduced to rule in the Campanian land than in Latium. How little, notwithstanding the labour bestowed on it, the Roman language and mode of writing had become settled at the close of this epoch, is shown by the inscriptions preserved from the end of the fifth century, in which the greatest arbitrariness prevails, particularly as to the insertion or omission of -m, -d and -s in final sounds and of -n in the body of a word, and as to the distinguishing of the vowels -o -u and -e -i.(26) It is probable that the contemporary Sabellians were in these points further advanced, while the Umbrians were but slightly affected by the regenerating influence of the Hellenes.

Instruction

In consequence of this progress of jurisprudence and grammar, elementary school-instruction also, which in itself had doubtless already emerged earlier, must have undergone a certain improvement. As Homer was the oldest Greek, and the Twelve Tables was the oldest Roman, book, each became in its own land the essential basis of instruction; and the learning by heart the juristico-political catechism was a chief part of Roman juvenile training. Alongside of

Page 426

the Latin “writing-masters” (-litteratores-) there were of course, from the time when an acquaintance with Greek was indispensable for every statesman and merchant, also Greek “language-masters” (-grammatici-)(27)—partly tutor-slaves, partly private teachers, who at their own dwelling or that of their pupil gave instructions in the reading and speaking of Greek. As a matter of course, the rod played its part in instruction as well as in military discipline and in police.(28) The instruction of this epoch cannot however have passed beyond the elementary stage: there was no material shade of difference, in a social respect, between the educated and the non-educated Roman.

Exact Sciences— Regulation of the Calendar

That the Romans at no time distinguished themselves in the mathematical and mechanical sciences is well known, and is attested, in reference to the present epoch, by almost the only fact which can be adduced under this head with certainty—the regulation of the calendar attempted by the decemvirs. They wished to substitute for the previous calendar based on the old and very imperfect -trieteris-(29) the contemporary Attic calendar of the -octaeteris-, which retained the lunar month of $29 \frac{1}{2}$ days but assumed the solar year at $365 \frac{1}{4}$ days instead of $368 \frac{3}{4}$, and therefore, without making any alteration in the length of the common year of 354 days, intercalated, not as formerly 59 days every 4 years, but 90 days every 8 years. With the same view the improvers of the Roman calendar intended—while otherwise retaining the current calendar—in the two inter-calary years of the four years’ cycle to shorten not the intercalary months, but the two Februaries by 7 days each, and consequently to fix that month in the intercalary years at 22 and 21 days respectively instead of 29 and 28. But want of mathematical precision and theological scruples, especially in reference to the annual festival of Terminus which fell within those very days in February, disarranged the intended reform, so that the Februaries of the intercalary years came to be of 24 and 23 days, and thus the new Roman solar year in reality ran to $366 \frac{1}{4}$ days. Some remedy for the practical evils resulting from this was found in the practice by which, setting aside the reckoning by the months or ten months of the calendar (30) as now no longer applicable from the inequality in the length of the months, wherever more accurate specifications were required, they accustomed themselves to reckon by terms of ten months of a solar year of 365 days or by the so-called ten-month year of 304 days. Over and above this, there came early into use in Italy, especially for agricultural purposes, the farmers’ calendar based on the Egyptian solar year of $365 \frac{1}{4}$ days by Eudoxus (who flourished 386).

Structural and Plastic Art

Page 427

A higher idea of what the Italians were able to do in these departments is furnished by their works of structural and plastic art, which are closely associated with the mechanical sciences. Here too we do not find phenomena of real originality; but if the impress of borrowing, which the plastic art of Italy bears throughout, diminishes its artistic interest, there gathers around it a historical interest all the more lively, because on the one hand it preserves the most remarkable evidences of an international intercourse of which other traces have disappeared, and on the other hand, amidst the well-nigh total loss of the history of the non-Roman Italians, art is almost the sole surviving index of the living activity which the different peoples of the peninsula displayed. No novelty is to be reported in this period; but what we have already shown⁽³¹⁾ may be illustrated in this period with greater precision and on a broader basis, namely, that the stimulus derived from Greece powerfully affected the Etruscans and Italians on different sides, and called forth among the former a richer and more luxurious, among the latter—where it had any influence at all—a more intelligent and more genuine, art.

Architecture— Etruscan

We have already shown how wholly the architecture of all the Italian lands was, even in its earliest period, pervaded by Hellenic elements. Its city walls, its aqueducts, its tombs with pyramidal roofs, and its Tuscanic temple, are not at all, or not materially, different from the oldest Hellenic structures. No trace has been preserved of any advance in architecture among the Etruscans during this period; we find among them neither any really new reception, nor any original creation, unless we ought to reckon as such the magnificent tombs, e. g. the so-called tomb of Porsena at Chiusi described by Varro, which vividly recalls the strange and meaningless grandeur of the Egyptian pyramids.

Latin— The Arch

In Latium too, during the first century and a half of the republic, it is probable that they moved solely in the previous track, and it has already been stated that the exercise of art rather sank than rose with the introduction of the republic.⁽³²⁾ There can scarcely be named any Latin building of architectural importance belonging to this period, except the temple of Ceres built in the Circus at Rome in 261, which was regarded in the period of the empire as a model of the Tuscanic style. But towards the close of this epoch a new spirit appeared in Italian and particularly in Roman architecture;⁽³³⁾ the building of the magnificent arches began. It is true that we are not entitled to pronounce the arch and the vault Italian inventions. It is well ascertained that at the epoch of the genesis of Hellenic architecture the Hellenes were not yet acquainted with the arch, and therefore had to content themselves with a flat ceiling and a sloping roof for their temples; but the arch may very well have

Page 428

been a later invention of the Hellenes originating in more scientific mechanics; as indeed the Greek tradition refers it to the natural philosopher Democritus (294-397). With this priority of Hellenic over Roman arch-building the hypothesis, which has been often and perhaps justly propounded, is quite compatible, that the vaulted roof of the Roman great -cloaca-, and that which was afterwards thrown over the old Capitoline well-house which originally had a pyramidal roof,(34) are the oldest extant structures in which the principle of the arch is applied; for it is more than probable that these arched buildings belong not to the regal but to the republican period,(35) and that in the regal period the Italians were acquainted only with flat or overlapped roofs.(34) But whatever may be thought as to the invention of the arch itself, the application of a principle on a great scale is everywhere, and particularly in architecture, at least as important as its first exposition; and this application belongs indisputably to the Romans. With the fifth century began the building of gates, bridges, and aqueducts based mainly on the arch, which is thenceforth inseparably associated with the Roman name. Akin to this was the development of the form of the round temple with the dome-shaped roof, which was foreign to the Greeks, but was held in much favour with the Romans and was especially applied by them in the case of the cults peculiar to them, particularly the non-Greek worship of Vesta.(37)

Something the same may be affirmed as true of various subordinate, but not on that account unimportant, achievements in this field. They do not lay claim to originality or artistic accomplishment; but the firmly-jointed stone slabs of the Roman streets, their indestructible highways, the broad hard ringing tiles, the everlasting mortar of their buildings, proclaim the indestructible solidity and the energetic vigour of the Roman character.

Plastic and Delineative Art

Like architectural art, and, if possible, still more completely, the plastic and delineative arts were not so much matured by Grecian stimulus as developed from Greek seeds on Italian soil. We have already observed(38) that these, although only younger sisters of architecture, began to develop themselves at least in Etruria, even during the Roman regal period; but their principal development in Etruria, and still more in Latium, belongs to the present epoch, as is very evident from the fact that in those districts which the Celts and Samnites wrested from the Etruscans in the course of the fourth century there is scarcely a trace of the practice of Etruscan art. The plastic art of the Tuscans applied itself first and chiefly to works in terra-cotta, in copper, and in gold-materials which were furnished to the artists by the rich strata of clay, the copper mines, and the commercial intercourse of Etruria. The vigour with which moulding in clay was prosecuted is attested

Page 429

by the immense number of bas-reliefs and statuary works in terra-cotta, with which the walls, gables, and roofs of the Etruscan temples were once decorated, as their still extant ruins show, and by the trade which can be shown to have existed in such articles from Etruria to Latium. Casting in copper occupied no inferior place. Etruscan artists ventured to make colossal statues of bronze fifty feet in height, and Volsinii, the Etruscan Delphi, was said to have possessed about the year 489 two thousand bronze statues. Sculpture in stone, again, began in Etruria, as probably everywhere, at a far later date, and was prevented from development not only by internal causes, but also by the want of suitable material; the marble quarries of Luna (Carrara) were not yet opened. Any one who has seen the rich and elegant gold decorations of the south-Etruscan tombs, will have no difficulty in believing the statement that Tyrrhene gold cups were valued even in Attica. Gem-engraving also, although more recent, was in various forms practised in Etruria. Equally dependent on the Greeks, but otherwise quite on a level with the workers in the plastic arts, were the Etruscan designers and painters, who manifested extraordinary activity both in outline-drawing on metal and in monochromatic fresco-painting.

Campanian and Sabellian

On comparing with this the domain of the Italians proper, it appears at first, contrasted with the Etruscan riches, almost poor in art. But on a closer view we cannot fail to perceive that both the Sabellian and the Latin nations must have had far more capacity and aptitude for art than the Etruscans. It is true that in the proper Sabellian territory, in Sabina, in the Abruzzi, in Samnium, there are hardly found any works of art at all, and even coins are wanting. But those Sabellian stocks, which reached the coasts of the Tyrrhene or Ionic seas, not only appropriated Hellenic art externally, like the Etruscans, but more or less completely acclimatized it. Even in Velitrae, where probably alone in the former land of the Volsci their language and peculiar character were afterwards maintained, painted terra-cottas have been found, displaying vigorous and characteristic treatment. In Lower Italy Lucania was to a less degree influenced by Hellenic art; but in Campania and in the land of the Bruttii, Sabellians and Hellenes became completely intermingled not only in language and nationality, but also and especially in art, and the Campanian and Bruttian coins in particular stand so entirely in point of artistic treatment on a level with the contemporary coins of Greece, that the inscription alone serves to distinguish the one from the other.

Latin

Page 430

It is a fact less known, but not less certain, that Latium also, while inferior to Etruria in the copiousness and massiveness of its art, was not inferior in artistic taste and practical skill. Evidently the establishment of the Romans in Campania which took place about the beginning of the fifth century, the conversion of the town of Cales into a Latin community, and that of the Falernian territory near Capua into a Roman tribe,(39) opened up in the first instance Campanian art to the Romans. It is true that among these the art of gem-engraving so diligently prosecuted in luxurious Etruria is entirely wanting, and we find no indication that the Latin workshops were, like those of the Etruscan goldsmiths and clay-workers, occupied in supplying a foreign demand. It is true that the Latin temples were not like the Etruscan overloaded with bronze and clay decorations, that the Latin tombs were not like the Etruscan filled with gold ornaments, and their walls shone not, like those of the Tuscan tombs, with paintings of various colours. Nevertheless, on the whole the balance does not incline in favour of the Etruscan nation. The device of the effigy of Janus, which, like the deity itself, may be attributed to the Latins,(40) is not unskilful, and is of a more original character than that of any Etruscan work of art. The beautiful group of the she-wolf with the twins attaches itself doubtless to similar Greek designs, but was—as thus worked out—certainly produced, if not in Rome, at any rate by Romans; and it deserves to be noted that it first appears on the silver moneys coined by the Romans in and for Campania. In the above-mentioned Cales there appears to have been devised soon after its foundation a peculiar kind of figured earthenware, which was marked with the name of the masters and the place of manufacture, and was sold over a wide district as far even as Etruria. The little altars of terra-cotta with figures that have recently been brought to light on the Esquiline correspond in style of representation as in that of ornament exactly to the similar votive gifts of the Campanian temples. This however does not exclude Greek masters from having also worked for Rome. The sculptor Damophilus, who with Gorgasus prepared the painted terra-cotta figures for the very ancient temple of Ceres, appears to have been no other than Demophilus of Himera, the teacher of Zeuxis (about 300). The most instructive illustrations are furnished by those branches of art in which we are able to form a comparative judgment, partly from ancient testimonies, partly from our own observation. Of Latin works in stone scarcely anything else survives than the stone sarcophagus of the Roman consul Lucius Scipio, wrought at the close of this period in the Doric style; but its noble simplicity puts to shame all similar Etruscan works. Many beautiful bronzes of an antique chaste style of art, particularly helmets, candelabra, and the like articles, have been taken

Page 431

from Etruscan tombs; but which of these works is equal to the bronze she-wolf erected from the proceeds of fines in 458 at the Ruminal fig-tree in the Roman Forum, and still forming the finest ornament of the Capitol? And that the Latin metal-founders as little shrank from great enterprises as the Etruscans, is shown by the colossal bronze figure of Jupiter on the Capitol erected by Spurius Carvilius (consul in 461) from the melted equipments of the Samnites, the chisellings of which sufficed to cast the statue of the victor that stood at the feet of the Colossus; this statue of Jupiter was visible even from the Alban Mount. Amongst the cast copper coins by far the finest belong to southern Latium; the Roman and Umbrian are tolerable, the Etruscan almost destitute of any image and often really barbarous. The fresco-paintings, which Gaius Fabius executed in the temple of Health on the Capitol, dedicated in 452, obtained in design and colouring the praise even of connoisseurs trained in Greek art in the Augustan age; and the art-enthusiasts of the empire commended the frescoes of Caere, but with still greater emphasis those of Rome, Lanuvium, and Ardea, as masterpieces of painting. Engraving on metal, which in Latium decorated not the hand-mirror, as in Etruria, but the toilet-casket with its elegant outlines, was practised to a far less extent in Latium and almost exclusively in Praeneste. There are excellent works of art among the copper mirrors of Etruria as among the caskets of Praeneste; but it was a work of the latter kind, and in fact a work which most probably originated in the workshop of a Praenestine master at this epoch,(41) regarding which it could with truth be affirmed that scarcely another product of the graving of antiquity bears the stamp of an art so finished in its beauty and characteristic expression, and yet so perfectly pure and chaste, as the Ficoroni -cista-.

Character of Etruscan Art

The general character of Etruscan works of art is, on the one hand, a sort of barbaric extravagance in material as well as in style; on the other hand, an utter absence of original development. Where the Greek master lightly sketches, the Etruscan disciple lavishes a scholar's diligence; instead of the light material and moderate proportions of the Greek works, there appears in the Etruscan an ostentatious stress laid upon the size and costliness, or even the mere singularity, of the work. Etruscan art cannot imitate without exaggerating; the chaste in its hands becomes harsh, the graceful effeminate, the terrible hideous, and the voluptuous obscene; and these features become more prominent, the more the original stimulus falls into the background and Etruscan art finds itself left to its own resources. Still more surprising is the adherence to traditional forms and a traditional style. Whether it was that a more friendly contact with Etruria at the outset allowed the Hellenes to scatter there the seeds of

Page 432

art, and that a later epoch of hostility impeded the admission into Etruria of the more recent developments of Greek art, or whether, as is more probable, the intellectual torpor that rapidly came over the nation was the main cause of the phenomenon, art in Etruria remained substantially stationary at the primitive stage which it had occupied on its first entrance. This, as is well known, forms the reason why Etruscan art, the stunted daughter, was so long regarded as the mother, of Hellenic art. Still more even than the rigid adherence to the style traditionally transmitted in the older branches of art, the sadly inferior handling of those branches that came into vogue afterwards, particularly of sculpture in stone and of copper-casting as applied to coins, shows how quickly the spirit of Etruscan art evaporated. Equally instructive are the painted vases, which are found in so enormous numbers in the later Etruscan tombs. Had these come into current use among the Etruscans as early as the metal plates decorated with contouring or the painted terra-cottas, beyond doubt they would have learned to manufacture them at home in considerable quantity, and of a quality at least relatively good; but at the period at which this luxury arose, the power of independent reproduction wholly failed—as the isolated vases provided with Etruscan inscriptions show—and they contented themselves with buying instead of making them.

North Etruscan and South Etruscan Art

But even within Etruria there appears a further remarkable distinction in artistic development between the southern and northern districts. It is South Etruria, particularly in the districts of Caere, Tarquinii, and Volci, that has preserved the great treasures of art which the nation boasted, especially in frescoes, temple decorations, gold ornaments, and painted vases. Northern Etruria is far inferior; no painted tomb, for example, has been found to the north of Chiusi. The most southern Etruscan cities, Veii, Caere, and Tarquinii, were accounted in Roman tradition the primitive and chief seats of Etruscan art; the most northerly town, Volaterrae, with the largest territory of all the Etruscan communities, stood most of all aloof from art. While a Greek semi-culture prevailed in South Etruria, Northern Etruria was much more marked by an absence of all culture. The causes of this remarkable contrast may be sought partly in differences of nationality—South Etruria being largely peopled in all probability by non-Etruscan elements⁽⁴²⁾—partly in the varying intensity of Hellenic influence, which must have made itself very decidedly felt at Caere in particular. The fact itself admits of no doubt. The more injurious on that account must have been the early subjugation of the southern half of Etruria by the Romans, and the Romanizing—which there began very early—of Etruscan art. What Northern Etruria, confined to its own efforts, was able to produce in the way of art, is shown by the copper coins which essentially belong to it.

Page 433

Character of Latin Art

Let us now turn from Etruria to glance at Latium. The latter, it is true, created no new art; it was reserved for a far later epoch of culture to develop on the basis of the arch a new architecture different from the Hellenic, and then to unfold in harmony with that architecture a new style of sculpture and painting. Latin art is nowhere original and often insignificant; but the fresh sensibility and the discriminating tact, which appropriate what is good in others, constitute a high artistic merit. Latin art seldom became barbarous, and in its best products it comes quite up to the level of Greek technical execution. We do not mean to deny that the art of Latium, at least in its earlier stages, had a certain dependence on the undoubtedly earlier Etruscan;(43) Varro may be quite right in supposing that, previous to the execution by Greek artists of the clay figures in the temple of Ceres,(44) only "Tuscanic" figures adorned the Roman temples; but that, at all events, it was mainly the direct influence of the Greeks that led Latin art into its proper channel, is self-evident, and is very obviously shown by these very statues as well as by the Latin and Roman coins. Even the application of graving on metal in Etruria solely to the toilet mirror, and in Latium solely to the toilet casket, indicates the diversity of the art-impulses that affected the two lands. It does not appear, however, to have been exactly at Rome that Latin art put forth its freshest vigour; the Roman -asses- and Roman -denarii- are far surpassed in fineness and taste of workmanship by the Latin copper, and the rare Latin silver, coins, and the masterpieces of painting and design belong chiefly to Praeneste, Lanuvium, and Ardea. This accords completely with the realistic and sober spirit of the Roman republic which we have already described—a spirit which can hardly have asserted itself with equal intensity in other parts of Latium. But in the course of the fifth century, and especially in the second half of it, there was a mighty activity in Roman art. This was the epoch, in which the construction of the Roman arches and Roman roads began; in which works of art like the she-wolf of the Capitol originated; and in which a distinguished man of an old Roman patrician clan took up his pencil to embellish a newly constructed temple and thence received the honorary surname of the "Painter." This was not accident. Every great age lays grasp on all the powers of man; and, rigid as were Roman manners, strict as was Roman police, the impulse received by the Roman burgesses as masters of the peninsula or, to speak more correctly, by Italy united for the first time as one state, became as evident in the stimulus given to Latin and especially to Roman art, as the moral and political decay of the Etruscan nation was evident in the decline of art in Etruria. As the mighty national vigour of Latium subdued the weaker nations, it impressed its imperishable stamp also on bronze and on marble.

Page 434

Notes for Book II Chapter IX

1. I. XV. Earliest Hellenic Influences

2. The account given by Dionysius (vi. 95; comp. Niebuhr, ii. 40) and by Plutarch (Camill. 42), deriving his statement from another passage in Dionysius regarding the Latin festival, must be understood to apply rather to the Roman games, as, apart from other grounds, is strikingly evident from comparing the latter passage with Liv. vi. 42 (Ritschl, Parerg. i. p. 313). Dionysius has—and, according to his wont when in error, persistently—misunderstood the expression -ludi maximi-.

There was, moreover, a tradition which referred the origin of the national festival not, as in the common version, to the conquest of the Latins by the first Tarquinius, but to the victory over the Latins at the lake Regillus (Cicero, de Div. i. 26, 55; Dionys. vii. 71). That the important statements preserved in the latter passage from Fabius really relate to the ordinary thanksgiving-festival, and not to any special votive solemnity, is evident from the express allusion to the annual recurrence of the celebration, and from the exact agreement of the sum of the expenses with the statement in the Pseudo-Asconius (p. 142 Or.).

3. II. III. Curule Aedileship

4. I. II. Art

5. I. XV. Metre

6. I. XV. Masks

7. II. VIII. Police f.

8. I. XV. Melody

9. A fragment has been preserved:

-Hiberno pulvere, verno luto, grandia farra Camille metes-

We do not know by what right this was afterwards regarded as the oldest Roman poem (Macrob. Sat. v. 20; Festus, Ep. v. Flaminius, p. 93, M.; Serv. on Virg. Georg. i. 101; Plin. xvii. 2. 14).

10. II. VIII. Appius Claudius

11. II. VIII. Rome and the Romans of This Epoch

12. The first places in the list alone excite suspicion, and may have been subsequently added, with a view to round off the number of years between the flight of the king and the burning of the city to 120.

13. I. *Vi.* Time and the Occasion of the Reform, *ii.* VII. System of Government

14. II. VIII Rome and the Romans of This Epoch. According to the annals Scipio commands in Etruria and his colleague in Samnium, and Lucania is during this year in league with Rome; according to the epitaph Scipio conquers two towns in Samnium and all Lucania.

15. I. XI. Jurisdiction, second note.

16. They appear to have reckoned three generations to a hundred years and to have rounded off the figures $233 \frac{1}{3}$ to 240, just as the epoch between the king's flight and the burning of the city was rounded off to 120 years (*ii.* IX. Registers of Magistrates, note). The reason why these precise numbers suggested themselves, is apparent from the similar adjustment (above explained, I. XIV. The Duodecimal System) of the measures of surface.

Page 435

17. I. XII. Spirits

18. I. X. Relations of the Western Italians to the Greeks

19. The "Trojan colonies" in Sicily, mentioned by Thucydides, the pseudo-Scylax, and others, as well as the designation of Capua as a Trojan foundation in Hecataeus, must also be traced to Stesichorus and his identification of the natives of Italy and Sicily with the Trojans.

20. According to his account Rome, a woman who had fled from Ilion to Rome, or rather her daughter of the same name, married Latinos, king of the Aborigines, and bore to him three sons, Romos, Romylos, and Telegonos. The last, who undoubtedly emerges here as founder of Tusculum and Praeneste, belongs, as is well known, to the legend of Odysseus.

21. II. IV. Fruitlessness of the Celtic Victory

22. II. VII. Relations between the East and West

23. II. VII. The Roman Fleet

24. II. II. Political Value of the Tribunates, *ii.* II. The Valerio-Horatian Laws

25. I. XIV. Corruption of Language and Writing

26. In the two epitaphs, of Lucius Scipio consul in 456, and of the consul of the same name in 495, -m and -d are ordinarily wanting in the termination of cases, yet -Luciom- and -Gnaivod- respectively occur once; there occur alongside of one another in the nominative -Cornelio- and -filios-; -cosol-, -cesor-, alongside of -consol-, -censor-; -aidiles-, -dedet-, -ploirume- (= -plurimi-) -hec- (nom. sing.) alongside of -aidilis-, -cepit-, -quei-, -hic-. Rhotacism is already carried out completely; we find -duonoro- (= -bonorum-), -ploirume-, not as in the chant of the Salii -foedesum-, -plusima-. Our surviving inscriptions do not in general precede the age of rhotacism; of the older -s only isolated traces occur, such as afterwards -honos-, -labos- alongside of -honor-, -labor-; and the similar feminine -praenomina-, -Maio- (= -maios- -maior-) and -Mino- in recently found epitaphs at Praeneste.

27. -Litterator- and -grammaticus- are related nearly as elementary teacher and teacher of languages with us; the latter designation belonged by earlier usage only to the teacher of Greek, not to a teacher of the mother-tongue. -Litteratus- is more recent, and denotes not a schoolmaster but a man of culture.

28. It is at any rate a true Roman picture, which Plautus (Bacch. 431) produces as a specimen of the good old mode of training children:—

... -ubi revenisses domum, Cincticulo praecinctus in sella apud magistrum adsideres; Si, librum cum legeres, unam peccavisses syllabam, Fieret corium tam maculosum, quam est nutricis pallium-.

36. I. XV. Earliest Hellenic Influences

37. The round temple certainly was not, as has been supposed, an imitation of the oldest form of the house; on the contrary, house architecture uniformly starts from the square form. The later Roman theology associated this round form with the idea of the terrestrial sphere or of the universe surrounding like a sphere the central sun (Fest. v. -rutundam-, p. 282; Plutarch, Num. 11; Ovid, Fast. vi. 267, seq.). In reality it may be traceable simply to the fact, that the circular shape has constantly been recognized as the most convenient and the safest form of a space destined for enclosure and custody. That was the rationale of the round —thesauroi— of the Greeks as well as of the round structure of the Roman store-chamber or temple of the Penates. It was natural, also, that the fireplace—that is, the altar of Vesta—and the fire-chamber—that is, the temple of Vesta —should be constructed of a round form, just as was done with the cistern and the well-enclosure (-puteal-). The round style of building in itself was Graeco-Italian as was the square form, and the former was appropriated to the store-place, the latter to the dwelling-house; but the architectural and religious development of the simple -tholos-into the round temple with pillars and columns was Latin.

THE HISTORY OF ROME: BOOK III

From the Union of Italy to the Subjugation of Carthage and the Greek States

Preparer's Note

This work contains many literal citations of and references to foreign words, sounds, and alphabetic symbols drawn from many languages, including Gothic and Phoenician, but chiefly Latin and Greek. This English Gutenberg edition, constrained to the characters of 7-bit ASCII code, adopts the following orthographic conventions:

1) Except for Greek, all literally cited non-English words that do not refer to texts cited as academic references, words that in the source manuscript appear italicized, are rendered with a single preceding, and a single following dash; thus, -xxxx-.

Page 437

2) Greek words, first transliterated into Roman alphabetic equivalents, are rendered with a preceding and a following double-dash; thus, —xxxx—. Note that in some cases the root word itself is a compound form such as xxx-xxxx, and is rendered as —xxx-xxx—

3) Simple unideographic references to vocalic sounds, single letters, or alphabetic diphthongs; and prefixes, suffixes, and syllabic references are represented by a single preceding dash; thus, -x, or -xxx.

4) Ideographic references, referring to signs of representation rather than to content, are represented as -"id:xxxx"-. "id:" stands for "ideograph", and indicates that the reader should form a picture based on the following "xxxx"; which may be a single symbol, a word, or an attempt at a picture composed of ASCII characters. For example, —"id:Gamma gamma"— indicates an uppercase Greek gamma-form followed by the form in lowercase. Some such exotic parsing as this is necessary to explain alphabetic development because a single symbol may have been used for a number of sounds in a number of languages, or even for a number of sounds in the same language at different times. Thus, "-id:Gamma gamma" might very well refer to a Phoenician construct that in appearance resembles the form that eventually stabilized as an uppercase Greek "gamma" juxtaposed to one of lowercase. Also, a construct such as —"id:E" indicates a symbol that with ASCII resembles most closely a Roman uppercase "E", but, in fact, is actually drawn more crudely.

5) Dr. Mommsen has given his dates in terms of Roman usage, A.U.C.; that is, from the founding of Rome, conventionally taken to be 753 B. C. The preparer of this document, has appended to the end of each volume a table of conversion between the two systems.

CHAPTER I

Carthage

The Phoenicians

The Semitic stock occupied a place amidst, and yet aloof from, the nations of the ancient classical world. The true centre of the former lay in the east, that of the latter in the region of the Mediterranean; and, however wars and migrations may have altered the line of demarcation and thrown the races across each other, a deep sense of diversity has always severed, and still severs, the Indo-Germanic peoples from the Syrian, Israelite, and Arabic nations. This diversity was no less marked in the case of that Semitic people which spread more than any other in the direction of the west—the Phoenicians. Their native seat was the narrow border of coast bounded by Asia Minor, the highlands of Syria, and Egypt, and called Canaan, that is, the “plain.” This was the only name which the nation itself made use of; even in Christian times the African farmer called himself a Canaanite. But Canaan received from the Hellenes the name of Phoenike, the “land of purple,” or “land of the red men,” and the Italians also were accustomed to call the Canaanites Punians, as we are accustomed still to speak of them as the Phoenician or Punic race.

Their Commerce

The land was well adapted for agriculture; but its excellent harbours and the abundant supply of timber and of metals favoured above all things the growth of commerce; and it was there perhaps, where the opulent eastern continent abuts on the wide-spreading Mediterranean so rich in harbours and islands, that commerce first dawned in all its greatness upon man. The Phoenicians directed all the resources of courage, acuteness, and enthusiasm to the full development of commerce and its attendant arts of navigation, manufacturing, and colonization, and thus connected the east and the west. At an incredibly early period we find them in Cyprus and Egypt, in Greece and Sicily, in Africa and Spain, and even on the Atlantic Ocean and the North Sea. The field of their commerce reached from Sierra Leone and Cornwall in the west, eastward to the coast of Malabar. Through their hands passed the gold and pearls of the East, the purple of Tyre, slaves, ivory, lions’ and panthers’ skins from the interior of Africa, frankincense from Arabia, the linen of Egypt, the pottery and fine wines of Greece, the copper of Cyprus, the silver of Spain, tin from England, and iron from Elba. The Phoenician mariners brought to every nation whatever it could need or was likely to

purchase; and they roamed everywhere, yet always returned to the narrow home to which their affections clung.

Their Intellectual Endowments

Page 439

The Phoenicians are entitled to be commemorated in history by the side of the Hellenic and Latin nations; but their case affords a fresh proof, and perhaps the strongest proof of all, that the development of national energies in antiquity was of a one-sided character. Those noble and enduring creations in the field of intellect, which owe their origin to the Aramaean race, do not belong primarily to the Phoenicians. While faith and knowledge in a certain sense were the especial property of the Aramaean nations and first reached the Indo-Germans from the east, neither the Phoenician religion nor Phoenician science and art ever, so far as we can see, held an independent rank among those of the Aramaean family. The religious conceptions of the Phoenicians were rude and uncouth, and it seemed as if their worship was meant to foster rather than to restrain lust and cruelty. No trace is discernible, at least in times of clear historical light, of any special influence exercised by their religion over other nations. As little do we find any Phoenician architecture or plastic art at all comparable even to those of Italy, to say nothing of the lands where art was native. The most ancient seat of scientific observation and of its application to practical purposes was Babylon, or at any rate the region of the Euphrates. It was there probably that men first followed the course of the stars; it was there that they first distinguished and expressed in writing the sounds of language; it was there that they began to reflect on time and space and on the powers at work in nature: the earliest traces of astronomy and chronology, of the alphabet, and of weights and measures, point to that region. The Phoenicians doubtless availed themselves of the artistic and highly developed manufactures of Babylon for their industry, of the observation of the stars for their navigation, of the writing of sounds and the adjustment of measures for their commerce, and distributed many an important germ of civilization along with their wares; but it cannot be demonstrated that the alphabet or any other of those ingenious products of the human mind belonged peculiarly to them, and such religious and scientific ideas as they were the means of conveying to the Hellenes were scattered by them more after the fashion of a bird dropping grains than of the husbandman sowing his seed. The power which the Hellenes and even the Italians possessed, of civilizing and assimilating to themselves the nations susceptible of culture with whom they came into contact, was wholly wanting in the Phoenicians. In the field of Roman conquest the Iberian and the Celtic languages have disappeared before the Romanic tongue; the Berbers of Africa speak at the present day the same language as they spoke in the times of the Hannos and the Barcides.

Their Political Qualities

Page 440

Above all, the Phoenicians, like the rest of the Aramaean nations as compared with the Indo-Germans, lacked the instinct of political life —the noble idea of self-governing freedom. During the most flourishing times of Sidon and Tyre the land of the Phoenicians was a perpetual apple of contention between the powers that ruled on the Euphrates and on the Nile, and was subject sometimes to the Assyrians, sometimes to the Egyptians. With half its power Hellenic cities would have made themselves independent; but the prudent men of Sidon calculated that the closing of the caravan-routes to the east or of the ports of Egypt would cost them more than the heaviest tribute, and so they punctually paid their taxes, as it might happen, to Nineveh or to Memphis, and even, if they could not avoid it, helped with their ships to fight the battles of the kings. And, as at home the Phoenicians patiently bore the oppression of their masters, so also abroad they were by no means inclined to exchange the peaceful career of commerce for a policy of conquest. Their settlements were factories. It was of more moment in their view to deal in buying and selling with the natives than to acquire extensive territories in distant lands, and to carry out there the slow and difficult work of colonization. They avoided war even with their rivals; they allowed themselves to be supplanted in Egypt, Greece, Italy, and the east of Sicily almost without resistance; and in the great naval battles, which were fought in early times for the supremacy of the western Mediterranean, at Alalia (217) and at Cumae (280), it was the Etruscans, and not the Phoenicians, that bore the brunt of the struggle with the Greeks. If rivalry could not be avoided, they compromised the matter as best they could; no attempt was ever made by the Phoenicians to conquer Caere or Massilia. Still less, of course, were the Phoenicians disposed to enter on aggressive war. On the only occasion in earlier times when they took the field on the offensive—in the great Sicilian expedition of the African Phoenicians which ended in their defeat at Himera by Gelo of Syracuse (274)—it was simply as dutiful subjects of the great-king and in order to avoid taking part in the campaign against the Hellenes of the east, that they entered the lists against the Hellenes of the west; just as their Syrian kinsmen were in fact obliged in that same year to share the defeat of the Persians at Salamis(1).

This was not the result of cowardice; navigation in unknown waters and with armed vessels requires brave hearts, and that such were to be found among the Phoenicians, they often showed. Still less was it the result of any lack of tenacity and idiosyncrasy of national feeling; on the contrary the Aramaeans defended their nationality with the weapons of intellect as well as with their blood against all the allurements of Greek civilization and all the coercive measures of eastern and western despots, and that with an obstinacy

Page 441

which no Indo-Germanic people has ever equalled, and which to us who are Occidentals seems to be sometimes more, sometimes less, than human. It was the result of that want of political instinct, which amidst all their lively sense of the ties of race, and amidst all their faithful attachment to the city of their fathers, formed the most essential feature in the character of the Phoenicians. Liberty had no charms for them, and they lusted not after dominion; “quietly they lived,” says the Book of Judges, “after the manner of the Sidonians, careless and secure, and in possession of riches.”

Carthage

Of all the Phoenician settlements none attained a more rapid and secure prosperity than those which were established by the Tyrians and Sidonians on the south coast of Spain and the north coast of Africa—regions that lay beyond the reach of the arm of the great king and the dangerous rivalry of the mariners of Greece, and in which the natives held the same relation to the strangers as the Indians in America held to the Europeans. Among the numerous and flourishing Phoenician cities along these shores, the most prominent by far was the “new town,” Karthada or, as the Occidentals called it, Karchedon or Carthago. Although not the earliest settlement of the Phoenicians in this region, and originally perhaps a dependency of the adjoining Utica, the oldest of the Phoenician towns in Libya, it soon outstripped its neighbours and even the motherland through the incomparable advantages of its situation and the energetic activity of its inhabitants. It was situated not far from the (former) mouth of the Bagradas (Mejerda), which flows through the richest corn district of northern Africa, and was placed on a fertile rising ground, still occupied with country houses and covered with groves of olive and orange trees, falling off in a gentle slope towards the plain, and terminating towards the sea in a sea-girt promontory. Lying in the heart of the great North-African roadstead, the Gulf of Tunis, at the very spot where that beautiful basin affords the best anchorage for vessels of larger size, and where drinkable spring water is got close by the shore, the place proved singularly favourable for agriculture and commerce and for the exchange of their respective commodities—so favourable, that not only was the Tyrian settlement in that quarter the first of Phoenician mercantile cities, but even in the Roman period Carthage was no sooner restored than it became the third city in the empire, and even now, under circumstances far from favourable and on a site far less judiciously chosen, there exists and flourishes in that quarter a city of a hundred thousand inhabitants. The prosperity, agricultural, mercantile, and industrial, of a city so situated and so peopled, needs no explanation; but the question requires an answer—in what way did this settlement come to attain a development of political power, such as no other Phoenician city possessed?

Page 442

Carthage Heads the Western Phoenicians in Opposition to the Hellenes

That the Phoenician stock did not even in Carthage renounce its policy of passiveness, there is no lack of evidence to prove. Carthage paid, even down to the times of its prosperity, a ground-rent for the space occupied by the city to the native Berbers, the tribe of the Maxyes or Maxitani; and although the sea and the desert sufficiently protected the city from any assault of the eastern powers, Carthage appears to have recognized—although but nominally—the supremacy of the great-king, and to have paid tribute to him occasionally, in order to secure its commercial communications with Tyre and the East.

But with all their disposition to be submissive and cringing, circumstances occurred which compelled these Phoenicians to adopt a more energetic policy. The stream of Hellenic migration was pouring ceaselessly towards the west: it had already dislodged the Phoenicians from Greece proper and Italy, and it was preparing to supplant them also in Sicily, in Spain, and even in Libya itself. The Phoenicians had to make a stand somewhere, if they were not willing to be totally crushed. In this case, where they had to deal with Greek traders and not with the great-king, submission did not suffice to secure the continuance of their commerce and industry on its former footing, liable merely to tax and tribute. Massilia and Cyrene were already founded; the whole east of Sicily was already in the hands of the Greeks; it was full time for the Phoenicians to think of serious resistance. The Carthaginians undertook the task; after long and obstinate wars they set a limit to the advance of the Cyrenaeans, and Hellenism was unable to establish itself to the west of the desert of Tripolis. With Carthaginian aid, moreover, the Phoenician settlers on the western point of Sicily defended themselves against the Greeks, and readily and gladly submitted to the protection of the powerful cognate city.⁽²⁾ These important successes, which occurred in the second century of Rome, and which saved for the Phoenicians the south-western portion of the Mediterranean, served of themselves to give to the city which had achieved them the hegemony of the nation, and to alter at the same time its political position. Carthage was no longer a mere mercantile city: it aimed at the dominion of Libya and of a part of the Mediterranean, because it could not avoid doing so. It is probable that the custom of employing mercenaries contributed materially to these successes. That custom came into vogue in Greece somewhere about the middle of the fourth century of Rome, but among the Orientals and the Carians more especially it was far older, and it was perhaps the Phoenicians themselves that began it. By the system of foreign recruiting war was converted into a vast pecuniary speculation, which was quite in keeping with the character and habits of the Phoenicians.

The Carthaginian Dominion in Africa

Page 443

It was probably the reflex influence of these successes abroad, that first led the Carthaginians to change the character of their occupation in Africa from a tenure of hire and sufferance to one of proprietorship and conquest. It appears to have been only about the year 300 of Rome that the Carthaginian merchants got rid of the rent for the soil, which they had hitherto been obliged to pay to the natives. This change enabled them to prosecute a husbandry of their own on a great scale. From the outset the Phoenicians had been desirous to employ their capital as landlords as well as traders, and to practise agriculture on a large scale by means of slaves or hired labourers; a large portion of the Jews in this way served the merchant-princes of Tyre for daily wages. Now the Carthaginians could without restriction extract the produce of the rich Libyan soil by a system akin to that of the modern planters; slaves in chains cultivated the land—we find single citizens possessing as many as twenty thousand of them. Nor was this all. The agricultural villages of the surrounding region—agriculture appears to have been introduced among the Libyans at a very early period, probably anterior to the Phoenician settlement, and presumably from Egypt—were subdued by force of arms, and the free Libyan farmers were transformed into fellahs, who paid to their lords a fourth part of the produce of the soil as tribute, and were subjected to a regular system of recruiting for the formation of a home Carthaginian army. Hostilities were constantly occurring with the roving pastoral tribes (—nomades—) on the borders; but a chain of fortified posts secured the territory enclosed by them, and the Nomades were slowly driven back into the deserts and mountains, or were compelled to recognize Carthaginian supremacy, to pay tribute, and to furnish contingents. About the period of the first Punic war their great town Theveste (Tebessa, at the sources of the Mejerda) was conquered by the Carthaginians. These formed the “towns and tribes (—ethne—) of subjects,” which appear in the Carthaginian state-treaties; the former being the non-free Libyan villages, the latter the subject Nomades.

Libyphoenicians

To this fell to be added the sovereignty of Carthage over the other Phoenicians in Africa, or the so-called Liby-phoenicians. These included, on the one hand, the smaller settlements sent forth from Carthage along the whole northern and part of the north-western coast of Africa—which cannot have been unimportant, for on the Atlantic seaboard alone there were settled at one time 30,000 such colonists —and, on the other hand, the old Phoenician settlements especially numerous along the coast of the present province of Constantine and Beylik of Tunis, such as Hippo afterwards called Regius (Bona), Hadrumetum (Susa), Little Leptis (to the south of Susa)—the second city of the Phoenicians in Africa—Thapsus (in the same quarter), and Great Leptis (Lebda to the

Page 444

west of Tripoli). In what way all these cities came to be subject to Carthage—whether voluntarily, for their protection perhaps from the attacks of the Cyrenaeans and Numidians, or by constraint—can no longer be ascertained; but it is certain that they are designated as subjects of the Carthaginians even in official documents, that they had to pull down their walls, and that they had to pay tribute and furnish contingents to Carthage. They were not liable however either to recruiting or to the land-tax, but contributed a definite amount of men and money, Little Leptis for instance paying the enormous sum annually of 365 talents (90,000 pounds); moreover they lived on a footing of equality in law with the Carthaginians, and could marry with them on equal terms.(3) Utica alone escaped a similar fate and had its walls and independence preserved to it, less perhaps from its own power than from the pious feeling of the Carthaginians towards their ancient protectors; in fact, the Phoenicians cherished for such relations a remarkable feeling of reverence presenting a thorough contrast to the indifference of the Greeks. Even in intercourse with foreigners it is always “Carthage and Utica” that stipulate and promise in conjunction; which, of course, did not preclude the far more important “new town” from practically asserting its hegemony also over Utica. Thus the Tyrian factory was converted into the capital of a mighty North -African empire, which extended from the desert of Tripoli to the Atlantic Ocean, contenting itself in its western portion (Morocco and Algiers) with the occupation, and that to some extent superficial, of a belt along the coast, but in the richer eastern portion (the present districts of Constantine and Tunis) stretching its sway over the interior also and constantly pushing its frontier farther to the south. The Carthaginians were, as an ancient author significantly expresses it, converted from Tyrians into Libyans. Phoenician civilization prevailed in Libya just as Greek civilization prevailed in Asia Minor and Syria after the campaigns of Alexander, although not with the same intensity. Phoenician was spoken and written at the courts of the Nomad sheiks, and the more civilized native tribes adopted for their language the Phoenician alphabet;(4) to Phoenicise them completely suited neither the genius of the nation nor the policy of Carthage.

The epoch, at which this transformation of Carthage into the capital of Libya took place, admits the less of being determined, because the change doubtless took place gradually. The author just mentioned names Hanno as the reformer of the nation. If the Hanno is meant who lived at the time of the first war with Rome, he can only be regarded as having completed the new system, the carrying out of which presumably occupied the fourth and fifth centuries of Rome.

Page 445

The flourishing of Carthage was accompanied by a parallel decline in the great cities of the Phoenician mother-country, in Sidon and especially in Tyre, the prosperity of which was destroyed partly by internal commotions, partly by the pressure of external calamities, particularly of its sieges by Salmanassar in the first, Nebuchodrossor in the second, and Alexander in the fifth century of Rome. The noble families and the old firms of Tyre emigrated for the most part to the secure and flourishing daughter-city, and carried thither their intelligence, their capital, and their traditions. At the time when the Phoenicians came into contact with Rome, Carthage was as decidedly the first of Canaanite cities as Rome was the first of the Latin communities.

Naval Power of Carthage

But the empire of Libya was only half of the power of Carthage; its maritime and colonial dominion had acquired, during the same period, a not less powerful development.

Spain

In Spain the chief station of the Phoenicians was the primitive Tyrian settlement at Gades (Cadiz). Besides this they possessed to the west and east of it a chain of factories, and in the interior the region of the silver mines; so that they held nearly the modern Andalusia and Granada, or at least the coasts of these provinces. They made no effort to acquire the interior from the warlike native nations; they were content with the possession of the mines and of the stations for traffic and for shell and other fisheries; and they had difficulty in maintaining their ground even in these against the adjoining tribes. It is probable that these possessions were not properly Carthaginian but Tyrian, and Gades was not reckoned among the cities tributary to Carthage; but practically, like all the western Phoenicians, it was under Carthaginian hegemony, as is shown by the aid sent by Carthage to the Gaditani against the natives, and by the institution of Carthaginian trading settlements to the westward of Gades. Ebusus and the Baleares, again, were occupied by the Carthaginians themselves at an early period, partly for the fisheries, partly as advanced posts against the Massiliots, with whom furious conflicts were waged from these stations.

Sardinia

In like manner the Carthaginians already at the end of the second century of Rome established themselves in Sardinia, which was utilized by them precisely in the same way as Libya. While the natives withdrew into the mountainous interior of the island to escape from bondage as agricultural serfs, just as the Numidians in Africa withdrew to the borders of the desert, Phoenician colonies were conducted to Caralis (Cagliari) and other important points, and the fertile districts along the coast were turned to account by the introduction of Libyan cultivators.

Sicily

Page 446

Lastly in Sicily the straits of Messana and the larger eastern half of the island had fallen at an early period into the hands of the Greeks; but the Phoenicians, with the help of the Carthaginians, retained the smaller adjacent islands, the Aegates, Melita, Gaulos, Cossyra—the settlement in Malta especially was rich and flourishing—and they kept the west and north-west coast of Sicily, whence they maintained communication with Africa by means of Motya and afterwards of Lilybaeum and with Sardinia by means of Panormus and Soluntum. The interior of the island remained in the possession of the natives, the Elymi, Sicani, and Siceli. After the further advance of the Greeks was checked, a state of comparative peace had prevailed in the island, which even the campaign undertaken by the Carthaginians at the instigation of the Persians against their Greek neighbours on the island (274) did not permanently interrupt, and which continued on the whole to subsist till the Attic expedition to Sicily (339-341). The two competing nations made up their minds to tolerate each other, and confined themselves in the main each to its own field.

Maritime Supremacy Rivalry with Syracuse

All these settlements and possessions were important enough in themselves; but they were of still greater moment, inasmuch as they became the pillars of the Carthaginian maritime supremacy. By their possession of the south of Spain, of the Baleares, of Sardinia, of western Sicily and Melita, and by their prevention of Hellenic colonies on the east coast of Spain, in Corsica, and in the region of the Syrtes, the masters of the north coast of Africa rendered their sea a closed one, and monopolized the western straits. In the Tyrrhene and Gallic seas alone the Phoenicians were obliged to admit the rivalry of other nations. This state of things might perhaps be endured, so long as the Etruscans and the Greeks served to counterbalance each other in these waters; with the former, as the less dangerous rivals, Carthage even entered into an alliance against the Greeks. But when, on the fall of the Etruscan power—a fall which, as is usually the case in such forced alliances, Carthage had hardly exerted all her power to avert—and after the miscarriage of the great projects of Alcibiades, Syracuse stood forth as indisputably the first Greek naval power, not only did the rulers of Syracuse naturally begin to aspire to dominion over Sicily and lower Italy and at the same time over the Tyrrhene and Adriatic seas, but the Carthaginians also were compelled to adopt a more energetic policy. The immediate result of the long and obstinate conflicts between them and their equally powerful and infamous antagonist, Dionysius of Syracuse (348-389), was the annihilation or weakening of the intervening Sicilian states—a result which both parties had an interest in accomplishing—and the division of the island between the Syracusans and Carthaginians. The most flourishing cities

Page 447

in the island—Selinus, Himera, Agrigentum, Gela, and Messana—were utterly destroyed by the Carthaginians in the course of these unhappy conflicts: and Dionysius was not displeased to see Hellenism destroyed or suppressed there, so that, leaning for support on foreign mercenaries enlisted from Italy, Gaul and Spain, he might rule in greater security over provinces which lay desolate or which were occupied by military colonies. The peace, which was concluded after the victory of the Carthaginian general Mago at Kronion (371), and which subjected to the Carthaginians the Greek cities of Thermae (the ancient Himera), Segesta, Heraclea Minoa, Selinus, and a part of the territory of Agrigentum as far as the Halycus, was regarded by the two powers contending for the possession of the island as only a temporary accommodation; on both sides the rivals were ever renewing their attempts to dispossess each other. Four several times—in 360 in the time of Dionysius the elder; in 410 in that of Timoleon; in 445 in that of Agathocles; in 476 in that of Pyrrhus—the Carthaginians were masters of all Sicily excepting Syracuse, and were baffled by its solid walls; almost as often the Syracusans, under able leaders, such as were the elder Dionysius, Agathocles, and Pyrrhus, seemed equally on the eve of dislodging the Africans from the island. But more and more the balance inclined to the side of the Carthaginians, who were, as a rule, the aggressors, and who, although they did not follow out their object with Roman steadfastness, yet conducted their attack with far greater method and energy than the Greek city, rent and worn out by factions, conducted its defence. The Phoenicians might with reason expect that a pestilence or a foreign -condottiere- would not always snatch the prey from their hands; and for the time being, at least at sea, the struggle was already decided:(5) the attempt of Pyrrhus to re-establish the Syracusan fleet was the last. After the failure of that attempt, the Carthaginian fleet commanded without a rival the whole western Mediterranean; and their endeavours to occupy Syracuse, Rhegium, and Tarentum, showed the extent of their power and the objects at which they aimed. Hand in hand with these attempts went the endeavour to monopolize more and more the maritime commerce of this region, at the expense alike of foreigners and of their own subjects; and it was not the wont of the Carthaginians to recoil from any violence that might help forward their purpose. A contemporary of the Punic wars, Eratosthenes, the father of geography (479-560), affirms that every foreign mariner sailing towards Sardinia or towards the Straits of Gades, who fell into the hands of the Carthaginians, was thrown by them into the sea; and with this statement the fact completely accords, that Carthage by the treaty of 406 (6) declared the Spanish, Sardinian, and Libyan ports open to Roman trading vessels, whereas by that of 448,(7) it totally closed them, with the exception of the port of Carthage itself, against the same.

Page 448

Constitution of Carthage
Council
Magistrates

Aristotle, who died about fifty years before the commencement of the first Punic war, describes the constitution of Carthage as having changed from a monarchy to an aristocracy, or to a democracy inclining towards oligarchy, for he designates it by both names. The conduct of affairs was immediately vested in the hands of the Council of Ancients, which, like the Spartan gerusia, consisted of the two kings nominated annually by the citizens, and of twenty-eight gerusiasts, who were also, as it appears, chosen annually by the citizens. It was this council which mainly transacted the business of the state-making, for instance, the preliminary arrangements for war, appointing levies and enlistments, nominating the general, and associating with him a number of gerusiasts from whom the sub-commanders were regularly taken; and to it despatches were addressed. It is doubtful whether by the side of this small council there existed a larger one; at any rate it was not of much importance. As little does any special influence seem to have belonged to the kings; they acted chiefly as supreme judges, and they were frequently so named (shofetes, -praetores-). The power of the general was greater. Isocrates, the senior contemporary of Aristotle, says that the Carthaginians had an oligarchical government at home, but a monarchical government in the field; and thus the office of the Carthaginian general may be correctly described by Roman writers as a dictatorship, although the gerusiasts attached to him must have practically at least restricted his power and, after he had laid down his office, a regular official reckoning—unknown among the Romans—awaited him. There existed no fixed term of office for the general, and for this very reason he was doubtless different from the annual king, from whom Aristotle also expressly distinguishes him. The combination however of several offices in one person was not unusual among the Carthaginians, and it is not therefore surprising that often the same person appears as at once general and shofete.

Judges

But the gerusia and the magistrates were subordinate to the corporation of the Hundred and Four (in round numbers the Hundred), or the Judges, the main bulwark of the Carthaginian oligarchy. It had no place in the original constitution of Carthage, but, like the Spartan ephorate, it originated in an aristocratic opposition to the monarchical elements of that constitution. As public offices were purchasable and the number of members forming the supreme board was small, a single Carthaginian family, eminent above all others in wealth and military renown, the clan of Mago,⁽⁸⁾ threatened to unite in its own hands the management of the state in peace and war and the administration of justice. This led, nearly about the time of the decemvirs, to an alteration of the constitution and to the appointment of this new board. We

Page 449

know that the holding of the quaestorship gave a title to admission into the body of judges, but that the candidate had nevertheless to be elected by certain self-electing Boards of Five (Pentarchies); and that the judges, although presumably by law chosen from year to year, practically remained in office for a longer period or indeed for life, for which reason they are usually called “senators” by the Greeks and Romans. Obscure as are the details, we recognize clearly the nature of the body as an oligarchical board constituted by aristocratic cooptation; an isolated but characteristic indication of which is found in the fact that there were in Carthage special baths for the judges over and above the common baths for the citizens. They were primarily intended to act as political jurymen, who summoned the generals in particular, but beyond doubt the shofetes and gerusiasts also when circumstances required, to a reckoning on resigning office, and inflicted even capital punishment at pleasure, often with the most reckless cruelty. Of course in this as in every instance, where administrative functionaries are subjected to the control of another body, the real centre of power passed over from the controlled to the controlling authority; and it is easy to understand on the one hand how the latter came to interfere in all matters of administration—the gerusia for instance submitted important despatches first to the judges, and then to the people—and on the other hand how fear of the control at home, which regularly meted out its award according to success, hampered the Carthaginian statesman and general in council and action.

Citizens

The body of citizens in Carthage, though not expressly restricted, as in Sparta, to the attitude of passive bystanders in the business of the state, appears to have had but a very slight amount of practical influence on it. In the elections to the gerusia a system of open corruption was the rule; in the nomination of a general the people were consulted, but only after the nomination had really been made by proposal on the part of the gerusia; and other questions only went to the people when the gerusia thought fit or could not otherwise agree. Assemblies of the people with judicial functions were unknown in Carthage. The powerlessness of the citizens probably in the main resulted from their political organization; the Carthaginian mess-associations, which are mentioned in this connection and compared with the Spartan Pheiditia, were probably guilds under oligarchical management. Mention is made even of a distinction between “burgesses of the city” and “manual labourers,” which leads us to infer that the latter held a very inferior position, perhaps beyond the pale of law.

Character of the Government

Page 450

On a comprehensive view of its several elements, the Carthaginian constitution appears to have been a government of capitalists, such as might naturally arise in a burges-community which had no middle class of moderate means but consisted on the one hand of an urban rabble without property and living from hand to mouth, and on the other hand of great merchants, planters, and genteel overseers. The system of repairing the fortunes of decayed grandees at the expense of the subjects, by despatching them as tax-assessors and taskwork-overseers to the dependent communities—that infallible token of a rotten urban oligarchy—was not wanting in Carthage; Aristotle describes it as the main cause of the tried durability of the Carthaginian constitution. Up to his time no revolution worth mentioning had taken place in Carthage either from above or from below. The multitude remained without leaders in consequence of the material advantages which the governing oligarchy was able to offer to all ambitious or necessitous men of rank, and was satisfied with the crumbs, which in the form of electoral corruption or otherwise fell to it from the table of the rich. A democratic opposition indeed could not fail with such a government to emerge; but at the time of the first Punic war it was still quite powerless. At a later period, partly under the influence of the defeats which were sustained, its political influence appears on the increase, and that far more rapidly than the influence of the similar party at the same period in Rome; the popular assemblies began to give the ultimate decision in political questions, and broke down the omnipotence of the Carthaginian oligarchy. After the termination of the Hannibalic war it was even enacted, on the proposal of Hannibal, that no member of the council of a Hundred could hold office for two consecutive years; and thereby a complete democracy was introduced, which certainly was under existing circumstances the only means of saving Carthage, if there was still time to do so. This opposition was swayed by a strong patriotic and reforming enthusiasm; but the fact cannot withal be overlooked, that it rested on a corrupt and rotten basis. The body of citizens in Carthage, which is compared by well-informed Greeks to the people of Alexandria, was so disorderly that to that extent it had well deserved to be powerless; and it might well be asked, what good could arise from revolutions, where, as in Carthage, the boys helped to make them.

Capital and Its Power in Carthage

From a financial point of view, Carthage held in every respect the first place among the states of antiquity. At the time of the Peloponnesian war this Phoenician city was, according to the testimony of the first of Greek historians, financially superior to all the Greek states, and its revenues were compared to those of the great-king; Polybius calls it the wealthiest city in the world. The intelligent character of the Carthaginian husbandry—which, as

Page 451

was the case subsequently in Rome, generals and statesmen did not disdain scientifically to practise and to teach—is attested by the agronomic treatise of the Carthaginian Mago, which was universally regarded by the later Greek and Roman farmers as the fundamental code of rational husbandry, and was not only translated into Greek, but was edited also in Latin by command of the Roman senate and officially recommended to the Italian landholders. A characteristic feature was the close connection between this Phoenician management of land and that of capital: it was quoted as a leading maxim of Phoenician husbandry that one should never acquire more land than he could thoroughly manage. The rich resources of the country in horses, oxen, sheep, and goats, in which Libya by reason of its Nomad economy perhaps excelled at that time, as Polybius testifies, all other lands of the earth, were of great advantage to the Carthaginians. As these were the instructors of the Romans in the art of profitably working the soil, they were so likewise in the art of turning to good account their subjects; by virtue of which Carthage reaped indirectly the rents of the “best part of Europe,” and of the rich—and in some portions, such as in Byzacitis and on the lesser Syrtis, surpassingly productive—region of northern Africa. Commerce, which was always regarded in Carthage as an honourable pursuit, and the shipping and manufactures which commerce rendered flourishing, brought even in the natural course of things golden harvests annually to the settlers there; and we have already indicated how skilfully, by an extensive and evergrowing system of monopoly, not only all the foreign but also all the inland commerce of the western Mediterranean, and the whole carrying trade between the west and east, were more and more concentrated in that single harbour.

Science and art in Carthage, as afterwards in Rome, seem to have been mainly dependent on Hellenic influences, but they do not appear to have been neglected. There was a respectable Phoenician literature; and on the conquest of the city there were found rich treasures of art—not created, it is true, in Carthage, but carried off from Sicilian temples—and considerable libraries. But even intellect there was in the service of capital; the prominent features of its literature were chiefly agronomic and geographical treatises, such as the work of Mago already mentioned and the account by the admiral Hanno of his voyage along the west coast of Africa, which was originally deposited publicly in one of the Carthaginian temples, and which is still extant in a translation. Even the general diffusion of certain attainments, and particularly of the knowledge of foreign languages,(9) as to which the Carthage of this epoch probably stood almost on a level with Rome under the empire, forms an evidence of the thoroughly practical turn given to Hellenic culture in Carthage. It is absolutely impossible to form a conception of the mass of capital

Page 452

accumulated in this London of antiquity, but some notion at least may be gained of the sources of public revenue from the fact, that, in spite of the costly system on which Carthage organized its wars and in spite of the careless and faithless administration of the state property, the contributions of its subjects and the customs-revenue completely covered the expenditure, so that no direct taxes were levied from the citizens; and further, that even after the second Punic war, when the power of the state was already broken, the current expenses and the payment to Rome of a yearly instalment of 48,000 pounds could be met, without levying any tax, merely by a somewhat stricter management of the finances, and fourteen years after the peace the state proffered immediate payment of the thirty-six remaining instalments. But it was not merely the sum total of its revenues that evinced the superiority of the financial administration at Carthage. The economical principles of a later and more advanced epoch are found by us in Carthage alone of all the more considerable states of antiquity. Mention is made of foreign state-loans, and in the monetary system we find along with gold and silver mention of a token-money having no intrinsic value—a species of currency not used elsewhere in antiquity. In fact, if government had resolved itself into mere mercantile speculation, never would any state have solved the problem more brilliantly than Carthage.

Comparison between Carthage and Rome In Their Economy

Let us now compare the respective resources of Carthage and Rome. Both were agricultural and mercantile cities, and nothing more; art and science had substantially the same altogether subordinate and altogether practical position in both, except that in this respect Carthage had made greater progress than Rome. But in Carthage the moneyed interest preponderated over the landed, in Rome at this time the landed still preponderated over the moneyed; and, while the agriculturists of Carthage were universally large landlords and slave-holders, in the Rome of this period the great mass of the burgesses still tilled their fields in person. The majority of the population in Rome held property, and was therefore conservative; the majority in Carthage held no property, and was therefore accessible to the gold of the rich as well as to the cry of the democrats for reform. In Carthage there already prevailed all that opulence which marks powerful commercial cities, while the manners and police of Rome still maintained at least externally the severity and frugality of the olden times. When the ambassadors of Carthage returned from Rome, they told their colleagues that the relations of intimacy among the Roman senators surpassed all conception; that a single set of silver plate sufficed for the whole senate, and had reappeared in every house to which the envoys had been invited. The sneer is a significant token of the difference in the economic conditions on either side.

Page 453

In Their Constitution

In both the constitution was aristocratic; the judges governed in Carthage, as did the senate in Rome, and both on the same system of police-control. The strict state of dependence in which the governing board at Carthage held the individual magistrate, and the injunction to the citizens absolutely to refrain from learning the Greek language and to converse with a Greek only through the medium of the public interpreter, originated in the same spirit as the system of government at Rome; but in comparison with the cruel harshness and the absolute precision, bordering on silliness, of this Carthaginian state-tutelage, the Roman system of fining and censure appears mild and reasonable. The Roman senate, which opened its doors to eminent capacity and in the best sense represented the nation, was able also to trust it, and had no need to fear the magistrates. The Carthaginian senate, on the other hand, was based on a jealous control of administration by the government, and represented exclusively the leading families; its essence was mistrust of all above and below it, and therefore it could neither be confident that the people would follow whither it led, nor free from the dread of usurpations on the part of the magistrates. Hence the steady course of Roman policy, which never receded a step in times of misfortune, and never threw away the favours of fortune by negligence or indifference; whereas the Carthaginians desisted from the struggle when a last effort might perhaps have saved all, and, weary or forgetful of their great national duties, allowed the half-completed building to fall to pieces, only to begin it in a few years anew. Hence the capable magistrate in Rome was ordinarily on a good understanding with his government; in Carthage he was frequently at decided feud with his masters at home, and was forced to resist them by unconstitutional means and to make common cause with the opposing party of reform.

In the Treatment of Their Subject

Both Carthage and Rome ruled over communities of lineage kindred with their own, and over numerous others of alien race. But Rome had received into her citizenship one district after another, and had rendered it even legally accessible to the Latin communities; Carthage from the first maintained her exclusiveness, and did not permit the dependent districts even to cherish a hope of being some day placed upon an equal footing. Rome granted to the communities of kindred lineage a share in the fruits of victory, especially in the acquired domains; and sought, by conferring material advantages on the rich and noble, to gain over at least a party to her own interest in the other subject states. Carthage not only retained for herself the produce of her victories, but even deprived the most privileged cities of their freedom of trade. Rome, as a rule, did not wholly take away independence even from the subject communities, and imposed a fixed

Page 454

tribute on none; Carthage despatched her overseers everywhere, and loaded even the old-Phoenician cities with a heavy tribute, while her subject tribes were practically treated as state-slaves. In this way there was not in the compass of the Carthagino-African state a single community, with the exception of Utica, that would not have been politically and materially benefited by the fall of Carthage; in the Romano-Italic there was not one that had not much more to lose than to gain in rebelling against a government, which was careful to avoid injuring material interests, and which never at least by extreme measures challenged political opposition to conflict. If Carthaginian statesmen believed that they had attached to the interests of Carthage her Phoenician subjects by their greater dread of a Libyan revolt and all the landholders by means of token-money, they transferred mercantile calculation to a sphere to which it did not apply. Experience proved that the Roman symmachy, notwithstanding its seemingly looser bond of connection, kept together against Pyrrhus like a wall of rock, whereas the Carthaginian fell to pieces like a gossamer web as soon as a hostile army set foot on African soil. It was so on the landing of Agathocles and of Regulus, and likewise in the mercenary war; the spirit that prevailed in Africa is illustrated by the fact, that the Libyan women voluntarily contributed their ornaments to the mercenaries for their war against Carthage. In Sicily alone the Carthaginians appear to have exercised a milder rule, and to have attained on that account better results. They granted to their subjects in that quarter comparative freedom in foreign trade, and allowed them to conduct their internal commerce, probably from the outset and exclusively, with a metallic currency; far greater freedom of movement generally was allowed to them than was permitted to the Sardinians and Libyans. Had Syracuse fallen into Carthaginian hands, their policy would doubtless soon have changed. But that result did not take place; and so, owing to the well-calculated mildness of the Carthaginian government and the unhappy distractions of the Sicilian Greeks, there actually existed in Sicily a party really friendly to the Phoenicians; for example, even after the island had passed to the Romans, Philinus of Agrigentum wrote the history of the great war in a thoroughly Phoenician spirit. Nevertheless on the whole the Sicilians must, both as subjects and as Hellenes, have been at least as averse to their Phoenician masters as the Samnites and Tarentines were to the Romans.

In Finance

In a financial point of view the state revenues of Carthage doubtless far surpassed those of Rome; but this advantage was partly neutralized by the facts, that the sources of the Carthaginian revenue—tribute and customs—dried up far sooner (and just when they were most needed) than those of Rome, and that the Carthaginian mode of conducting war was far more costly than the Roman.

Page 455

In Their Military System

The military resources of the Romans and Carthaginians were very different, yet in many respects not unequally balanced. The citizens of Carthage still at the conquest of the city amounted to 700,000, including women and children,(10) and were probably at least as numerous at the close of the fifth century; in that century they were able in case of need to set on foot a burgess-army of 40,000 hoplites. At the very beginning of the fifth century, Rome had in similar circumstances sent to the field a burgess-army equally strong;(11) after the great extensions of the burgess-domain in the course of that century the number of full burgesses capable of bearing arms must at least have doubled. But far more than in the number of men capable of bearing arms, Rome excelled in the effective condition of the burgess-soldier. Anxious as the Carthaginian government was to induce its citizens to take part in military service, it could neither furnish the artisan and the manufacturer with the bodily vigour of the husbandman, nor overcome the native aversion of the Phoenicians to warfare. In the fifth century there still fought in the Sicilian armies a "sacred band" of 2500 Carthaginians as a guard for the general; in the sixth not a single Carthaginian, officers excepted, was to be met with in the Carthaginian armies, e. g. in that of Spain. The Roman farmers, again, took their places not only in the muster-roll, but also in the field of battle. It was the same with the cognate races of both communities; while the Latins rendered to the Romans no less service than their own burgess-troops, the Liby-phoenicians were as little adapted for war as the Carthaginians, and, as may easily be supposed, still less desirous of it, and so they too disappeared from the armies; the towns bound to furnish contingents presumably redeemed their obligation by a payment of money. In the Spanish army just mentioned, composed of some 15,000 men, only a single troop of cavalry of 450 men consisted, and that but partly, of Liby-phoenicians. The flower of the Carthaginian armies was formed by the Libyan subjects, whose recruits were capable of being trained under able officers into good infantry, and whose light cavalry was unsurpassed in its kind. To these were added the forces of the more or less dependent tribes of Libya and Spain and the famous slingers of the Baleares, who seem to have held an intermediate position between allied contingents and mercenary troops; and finally, in case of need, the hired soldiery enlisted abroad. So far as numbers were concerned, such an army might without difficulty be raised almost to any desired strength; and in the ability of its officers, in acquaintance with arms, and in courage it might be capable of coping with that of Rome. Not only, however, did a dangerously long interval elapse, in the event of mercenaries being required, ere they could be got ready, while the Roman militia was able at any moment to take the

Page 456

field, but—which was the main matter—there was nothing to keep together the armies of Carthage but military honour and personal advantage, while the Romans were united by all the ties that bound them to their common fatherland. The Carthaginian officer of the ordinary type estimated his mercenaries, and even the Libyan farmers, very much as men in modern warfare estimate cannon-balls; hence such disgraceful proceedings as the betrayal of the Libyan troops by their general Himilco in 358, which was followed by a dangerous insurrection of the Libyans, and hence that proverbial cry of “Punic faith,” which did the Carthaginians no small injury. Carthage experienced in full measure all the evils which armies of fellahs and mercenaries could bring upon a state, and more than once she found her paid serfs more dangerous than her foes.

The Carthaginian government could not fail to perceive the defects of this military system, and they certainly sought to remedy them by every available means. They insisted on maintaining full chests and full magazines, that they might at any time be able to equip mercenaries. They bestowed great care on those elements which among the ancients represented the modern artillery—the construction of machines, in which we find the Carthaginians regularly superior to the Siceliots, and the use of elephants, after these had superseded in warfare the earlier war-chariots: in the casemates of Carthage there were stalls for 300 elephants. They could not venture to fortify the dependent cities, and were obliged to submit to the occupation of the towns and villages as well as of the open country by any hostile army that landed in Africa—a thorough contrast to the state of Italy, where most of the subject towns had retained their walls, and a chain of Roman fortresses commanded the whole peninsula. But on the fortification of the capital they expended all the resources of money and of art, and on several occasions nothing but the strength of its walls saved the state; whereas Rome held a political and military position so secure that it never underwent a formal siege. Lastly, the main bulwark of the state was their war-marine, on which they lavished the utmost care. In the building as well as in the management of vessels the Carthaginians excelled the Greeks; it was at Carthage that ships were first built of more than three banks of oars, and the Carthaginian war-vessels, at this period mostly quinqueremes, were ordinarily better sailors than the Greek; the rowers, all of them public slaves, who never stirred from the galleys, were excellently trained, and the captains were expert and fearless. In this respect Carthage was decidedly superior to the Romans, who, with the few ships of their Greek allies and still fewer of their own, were unable even to show themselves in the open sea against the fleet which at that time without a rival ruled the western Mediterranean.

Page 457

If, in conclusion, we sum up the results of this comparison of the resources of the two great powers, the judgment expressed by a sagacious and impartial Greek is perhaps borne out, that Carthage and Rome were, when the struggle between them began, on the whole equally matched. But we cannot omit to add that, while Carthage had put forth all the efforts of which intellect and wealth were capable to provide herself with artificial means of attack and defence, she was unable in any satisfactory way to make up for the fundamental wants of a land army of her own and of a symmachy resting on a self-supporting basis. That Rome could only be seriously attacked in Italy, and Carthage only in Libya, no one could fail to see; as little could any one fail to perceive that Carthage could not in the long run escape from such an attack. Fleets were not yet in those times of the infancy of navigation a permanent heirloom of nations, but could be fitted out wherever there were trees, iron, and water. It was clear, and had been several times tested in Africa itself, that even powerful maritime states were not able to prevent enemies weaker by sea from landing. When Agathocles had shown the way thither, a Roman general could follow the same course; and while in Italy the entrance of an invading army simply began the war, the same event in Libya put an end to it by converting it into a siege, in which, unless special accidents should intervene, even the most obstinate and heroic courage must finally succumb.

Notes for Chapter I

1. II. IV. Victories of Salamis and Himera, and Their Effects
2. I. X. Phoenicians and Italians in Opposition to the Hellenes
3. The most precise description of this important class occurs in the Carthaginian treaty (Polyb. vii. 9), where in contrast to the Uticenses on the one hand, and to the Libyan subjects on the other, they are called —ol Karchedonion uparchoi osoi tois autois nomois chrontai—. Elsewhere they are spoken of as cities allied (—summachides poleis—, Diod. xx. 10) or tributary (Liv. xxxiv. 62; Justin, xxii. 7, 3). Their -conubium- with the Carthaginians is mentioned by Diodorus, xx. 55; the -commercium- is implied in the “like laws.” That the old Phoenician colonies were included among the Liby-phoenicians, is shown by the designation of Hippo as a Liby-phoenician city (Liv. xxv. 40); on the other hand as to the settlements founded from Carthage, for instance, it is said in the Periplus of Hanno: “the Carthaginians resolved that Hanno should sail beyond the Pillars of Hercules and found cities of Liby-phoenicians.” In substance the word “Liby-phoenicians” was used by the Carthaginians not as a national designation, but as a category of state-law. This view is quite consistent with the fact that grammatically the name denotes Phoenicians mingled with Libyans (Liv. xxi. 22, an addition to the text of Polybius); in reality, at least in the institution of very exposed colonies, Libyans were frequently associated with Phoenicians (Diod. xiii. 79; Cic. pro Scauro, 42). The analogy in name and legal position between the Latins of Rome and the Liby-phoenicians of Carthage is unmistakable.

Page 458

4. The Libyan or Numidian alphabet, by which we mean that which was and is employed by the Berbers in writing their non-Semitic language—one of the innumerable alphabets derived from the primitive Aramaean one—certainly appears to be more closely related in several of its forms to the latter than is the Phoenician alphabet; but it by no means follows from this, that the Libyans derived their writing not from Phoenicians but from earlier immigrants, any more than the partially older forms of the Italian alphabets prohibit us from deriving these from the Greek. We must rather assume that the Libyan alphabet has been derived from the Phoenician at a period of the latter earlier than the time at which the records of the Phoenician language that have reached us were written.

8. II. IV. Etrusco-Carthaginian Maritime Supremacy

9. The steward on a country estate, although a slave, ought, according to the precept of the Carthaginian agronome Mago (ap. Varro, R. R. i. 17), to be able to read, and ought to possess some culture. In the prologue of the “Poenulus” of Plautus, it is said of the hero of the title:-

-Et is omnes linguas scit; sed dissimulat sciens Se scire; Poenus plane est; quid verbit opus't-?

10. Doubts have been expressed as to the correctness of this number, and the highest possible number of inhabitants, taking into account the available space, has been reckoned at 250,000. Apart from the uncertainty of such calculations, especially as to a commercial city with houses of six stories, we must remember that the numbering is doubtless to be understood in a political, not in an urban, sense, just like the numbers in the Roman census, and that thus all Carthaginians would be included in it, whether dwelling in the city or its neighbourhood, or resident in its subject territory or in other lands. There would, of course, be a large number of such absentees in the case of Carthage; indeed it is expressly stated that in Gades, for the same reason, the burgess-roll always showed a far higher number than that of the citizens who had their fixed residence there.

CHAPTER II

The War between Rome and Carthage Concerning Sicily

State of Sicily

For upwards of a century the feud between the Carthaginians and the rulers of Syracuse had devastated the fair island of Sicily. On both sides the contest was carried on with the weapons of political proselytism, for, while Carthage kept up communications with the aristocratic-republican opposition in Syracuse, the Syracusan dynasts maintained relations with the national party in the Greek cities that had become tributary to Carthage. On both sides armies of mercenaries

Page 459

were employed to fight their battles—by Timoleon and Agathocles, as well as by the Phoenician generals. And as like means were employed on both sides, so the conflict had been waged on both with a disregard of honour and a perfidy unexampled in the history of the west. The Syracusans were the weaker party. In the peace of 440 Carthage had still limited her claims to the third of the island to the west of Heraclea Minoa and Himera, and had expressly recognized the hegemony of the Syracusans over all the cities to the eastward. The expulsion of Pyrrhus from Sicily and Italy (479) left by far the larger half of the island, and especially the important Agrigentum, in the hands of Carthage; the Syracusans retained nothing but Tauromenium and the south-east of the island.

Campanian Mercenaries

In the second great city on the east coast, Messana, a band of foreign soldiers had established themselves and held the city, independent alike of Syracusans and Carthaginians. These new rulers of Messana were Campanian mercenaries. The dissolute habits that had become prevalent among the Sabellians settled in and around Capua,⁽¹⁾ had made Campania in the fourth and fifth centuries—what Aetolia, Crete, and Laconia were afterwards—the universal recruiting field for princes and cities in search of mercenaries. The semi-culture that had been called into existence there by the Campanian Greeks, the barbaric luxury of life in Capua and the other Campanian cities, the political impotence to which the hegemony of Rome condemned them, while yet its rule was not so stern as wholly to withdraw from them the right of self-disposal—all tended to drive the youth of Campania in troops to the standards of the recruiting officers. As a matter of course, this wanton and unscrupulous selling of themselves here, as everywhere, brought in its train estrangement from their native land, habits of violence and military disorder, and indifference to the breach of their allegiance. These Campanians could see no reason why a band of mercenaries should not seize on their own behalf any city entrusted to their guardianship, provided only they were in a position to hold it—the Samnites had established their dominion in Capua itself, and the Lucanians in a succession of Greek cities, after a fashion not much more honourable.

Mammertines

Nowhere was the state of political relations more inviting for such enterprises than in Sicily. Already the Campanian captains who came to Sicily during the Peloponnesian war had insinuated themselves in this way into Entella and Aetna. Somewhere about the year 470 a Campanian band, which had previously served under Agathocles and after his death (465) took up the trade of freebooters on their own account, established themselves in Messana, the second city of Greek Sicily, and the chief seat of the anti-Syracusan party in that portion of the island which was still in the power of the Greeks. The citizens were

Page 460

slain or expelled, their wives and children and houses were distributed among the soldiers, and the new masters of the city, the Mamertines or “men of Mars,” as they called themselves, soon became the third power in the island, the north-eastern portion of which they reduced to subjection in the times of confusion that succeeded the death of Agathocles. The Carthaginians were no unwilling spectators of these events, which established in the immediate vicinity of the Syracusans a new and powerful adversary instead of a cognate and ordinarily allied or dependent city. With Carthaginian aid the Mamertines maintained themselves against Pyrrhus, and the untimely departure of the king restored to them all their power.

Hiero of Syracuse

War between the Syracusans and the Mamertines

It is not becoming in the historian either to excuse the perfidious crime by which the Mamertines seized their power, or to forget that the God of history does not necessarily punish the sins of the fathers to the fourth generation. He who feels it his vocation to judge the sins of others may condemn the human agents; for Sicily it might be a blessing that a warlike power, and one belonging to the island, thus began to be formed in it—a power which was already able to bring eight thousand men into the field, and which was gradually putting itself in a position to take up at the proper time and on its own resources that struggle against the foreigners, to the maintenance of which the Hellenes, becoming more and more unaccustomed to arms notwithstanding their perpetual wars, were no longer equal.

In the first instance, however, things took another turn. A young Syracusan officer, who by his descent from the family of Gelo and his intimate relations of kindred with king Pyrrhus as well as by the distinction with which he had fought in the campaigns of the latter, had attracted the notice of his fellow-citizens as well as of the Syracusan soldiery—Hiero, son of Hierocles—was called by military election to command the army, which was at variance with the citizens (479-480). By his prudent administration, the nobility of his character, and the moderation of his views, he rapidly gained the hearts of the citizens of Syracuse—who had been accustomed to the most scandalous lawlessness in their despots—and of the Sicilian Greeks in general. He rid himself—in a perfidious manner, it is true—of the insubordinate army of mercenaries, revived the citizen-militia, and endeavoured, at first with the title of general, afterwards with that of king, to re-establish the deeply sunken Hellenic power by means of his civic troops and of fresh and more manageable recruits. With the Carthaginians, who in concert with the Greeks had driven king Pyrrhus from the island, there was at that time peace. The immediate foes of the Syracusans were the Mamertines. They were the kinsmen of those hated mercenaries whom the Syracusans had recently extirpated; they had murdered their own

Page 461

Greek hosts; they had curtailed the Syracusan territory; they had oppressed and plundered a number of smaller Greek towns. In league with the Romans who just about this time were sending their legions against the Campanians in Rhegium, the allies, kinsmen, and confederates in crime of the Mamertines,(2) Hiero turned his arms against Messana. By a great victory, after which Hiero was proclaimed king of the Siceliots (484), he succeeded in shutting up the Mamertines within their city, and after the siege had lasted some years, they found themselves reduced to extremity and unable to hold the city longer against Hiero on their own resources. It is evident that a surrender on stipulated conditions was impossible, and that the axe of the executioner, which had fallen upon the Campanians of Rhegium at Rome, as certainly awaited those of Messana at Syracuse. Their only means of safety lay in delivering up the city either to the Carthaginians or to the Romans, both of whom could not but be so strongly set upon acquiring that important place as to overlook all other scruples. Whether it would be more advantageous to surrender it to the masters of Africa or to the masters of Italy, was doubtful; after long hesitation the majority of the Campanian burgesses at length resolved to offer the possession of their sea-commanding fortress to the Romans.

The Mamertines Received into the Italian Confederacy

It was a moment of the deepest significance in the history of the world, when the envoys of the Mamertines appeared in the Roman senate. No one indeed could then anticipate all that was to depend on the crossing of that narrow arm of the sea; but that the decision, however it should go, would involve consequences far other and more important than had attached to any decree hitherto passed by the senate, must have been manifest to every one of the deliberating fathers of the city. Strictly upright men might indeed ask how it was possible to deliberate at all, and how any one could even think of suggesting that the Romans should not only break their alliance with Hiero, but should, just after the Campanians of Rhegium had been punished by them with righteous severity, admit the no less guilty Sicilian accomplices to the alliance and friendship of the state, and thereby rescue them from the punishment which they deserved. Such an outrage on propriety would not only afford their adversaries matter for declamation, but must seriously offend all men of moral feeling. But even the statesman, with whom political morality was no mere phrase, might ask in reply, how Roman burgesses, who had broken their military oath and treacherously murdered the allies of Rome, could be placed on a level with foreigners who had committed an outrage on foreigners, where no one had constituted the Romans judges of the one or avengers of the other? Had the question been only whether the Syracusans or Mamertines should rule in Messana, Rome might certainly have acquiesced

Page 462

in the rule of either. Rome was striving for the possession of Italy, as Carthage for that of Sicily; the designs of the two powers scarcely then went further. But that very circumstance formed a reason why each desired to have and retain on its frontier an intermediate power—the Carthaginians for instance reckoning in this way on Tarentum, the Romans on Syracuse and Messina—and why, if that course was impossible, each preferred to see these adjacent places given over to itself rather than to the other great power. As Carthage had made an attempt in Italy, when Rhegium and Tarentum were about to be occupied by the Romans, to acquire these cities for itself, and had only been prevented from doing so by accident, so in Sicily an opportunity now offered itself for Rome to bring the city of Messina into its symmarchy; should the Romans reject it, it was not to be expected that the city would remain independent or would become Syracusan; they would themselves throw it into the arms of the Phoenicians. Were they justified in allowing an opportunity to escape, such as certainly would never recur, of making themselves masters of the natural *tête de pont* between Italy and Sicily, and of securing it by means of a brave garrison on which they could, for good reasons, rely? Were they justified in abandoning Messina, and thereby surrendering the command of the last free passage between the eastern and western seas, and sacrificing the commercial liberty of Italy? It is true that other objections might be urged to the occupation of Messina besides mere scruples of feeling and of honourable policy. That it could not but lead to a war with Carthage, was the least of these; serious as was such a war, Rome might not fear it. But there was the more important objection that by crossing the sea the Romans would depart from the purely Italian and purely continental policy which they had hitherto pursued; they would abandon the system by which their ancestors had founded the greatness of Rome, to enter upon another system the results of which no one could foretell. It was one of those moments when calculation ceases, and when faith in men's own and in their country's destiny alone gives them courage to grasp the hand which beckons to them out of the darkness of the future, and to follow it no one knows whither. Long and seriously the senate deliberated on the proposal of the consuls to lead the legions to the help of the Mamertines; it came to no decisive resolution. But the burgesses, to whom the matter was referred, were animated by a lively sense of the greatness of the power which their own energy had established. The conquest of Italy encouraged the Romans, as that of Greece encouraged the Macedonians and that of Silesia the Prussians, to enter upon a new political career. A formal pretext for supporting the Mamertines was found in the protectorate which Rome claimed the right to exercise over all Italians. The transmarine Italians were received into the Italian confederacy;⁽³⁾ and on the proposal of the consuls the citizens resolved to send them aid (489).

Page 463

Variance between Rome and Carthage

Carthaginians in Messina

Messina Seized by the Romans

War between the Romans and the Carthaginians and the Syracusans

Much depended on the way in which the two Sicilian powers, immediately affected by this intervention of the Romans in the affairs of the island, and both hitherto nominally in alliance with Rome, would regard her interference. Hiero had sufficient reason to treat the summons, by which the Romans required him to desist from hostilities against their new confederates in Messina, precisely in the same way as the Samnites and Lucanians in similar circumstances had received the occupation of Capua and Thurii, and to answer the Romans by a declaration of war. If, however, he remained unsupported, such a war would be folly; and it might be expected from his prudent and moderate policy that he would acquiesce in what was inevitable, if Carthage should be disposed for peace. This seemed not impossible. A Roman embassy was now (489) sent to Carthage, seven years after the attempt of the Phoenician fleet to gain possession of Tarentum, to demand explanations as to these incidents.⁽⁴⁾ Grievances not unfounded, but half-forgotten, once more emerged—it seemed not superfluous amidst other warlike preparations to replenish the diplomatic armoury with reasons for war, and for the coming manifesto to reserve to themselves, as was the custom of the Romans, the character of the party aggrieved. This much at least might with entire justice be affirmed, that the respective enterprises on Tarentum and Messina stood upon exactly the same footing in point of design and of pretext, and that it was simply the accident of success that made the difference. Carthage avoided an open rupture. The ambassadors carried back to Rome the disavowal of the Carthaginian admiral who had made the attempt on Tarentum, along with the requisite false oaths: the counter-complaints, which of course were not wanting on the part of Carthage, were studiously moderate, and abstained from characterizing the meditated invasion of Sicily as a ground for war. Such, however, it was; for Carthage regarded the affairs of Sicily—just as Rome regarded those of Italy—as internal matters in which an independent power could allow no interference, and was determined to act accordingly. But Phoenician policy followed a gentler course than that of threatening open war. When the preparations of Rome for sending help to the Mamertines were at length so far advanced that the fleet formed of the war-vessels of Naples, Tarentum, Velia, and Locri, and the vanguard of the Roman land army under the military tribune Gaius Claudius, had appeared at Rhegium (in the spring of 490), unexpected news arrived from Messina that the Carthaginians, having come to an understanding with the anti-Roman party there, had as a neutral power arranged a peace between Hiero and the Mamertines; that the siege had in consequence been raised; and

Page 464

that a Carthaginian fleet lay in the harbour of Messina, and a Carthaginian garrison in the citadel, both under the command of admiral Hanno. The Mamertine citizens, now controlled by Carthaginian influence, informed the Roman commanders, with due thanks to the federal help so speedily accorded to them, that they were glad that they no longer needed it. The adroit and daring officer who commanded the Roman vanguard nevertheless set sail with his troops. But the Carthaginians warned the Roman vessels to retire, and even made some of them prizes; these, however, the Carthaginian admiral, remembering his strict orders to give no pretext for the outbreak of hostilities, sent back to his good friends on the other side of the straits. It almost seemed as if the Romans had compromised themselves as uselessly before Messina, as the Carthaginians before Tarentum. But Claudius did not allow himself to be deterred, and on a second attempt he succeeded in landing. Scarcely had he arrived when he called a meeting of the citizens; and, at his wish, the Carthaginian admiral also appeared at the meeting, still imagining that he should be able to avoid an open breach. But the Romans seized his person in the assembly itself; and Hanno and the Phoenician garrison in the citadel, weak and destitute of a leader, were pusillanimous enough, the former to give to his troops the command to withdraw, the latter to comply with the orders of their captive general and to evacuate the city along with him. Thus the *tete de pont* of the island fell into the hands of the Romans. The Carthaginian authorities, justly indignant at the folly and weakness of their general, caused him to be executed, and declared war against the Romans. Above all it was their aim to recover the lost place. A strong Carthaginian fleet, led by Hanno, son of Hannibal, appeared off Messina; while the fleet blockaded the straits, the Carthaginian army landing from it began the siege on the north side. Hiero, who had only waited for the Carthaginian attack to begin the war with Rome, again brought up his army, which he had hardly withdrawn, against Messina, and undertook the attack on the south side of the city.

Peace with Hiero

But meanwhile the Roman consul Appius Claudius Caudex had appeared at Rhegium with the main body of his army, and succeeded in crossing on a dark night in spite of the Carthaginian fleet. Audacity and fortune were on the side of the Romans; the allies, not prepared for an attack by the whole Roman army and consequently not united, were beaten in detail by the Roman legions issuing from the city; and thus the siege was raised. The Roman army kept the field during the summer, and even made an attempt on Syracuse; but, when that had failed and the siege of Echetla (on the confines of the territories of Syracuse and Carthage) had to be abandoned with loss, the Roman army returned to Messina, and thence, leaving a strong garrison behind them, to Italy. The results obtained

Page 465

in this first campaign of the Romans out of Italy may not quite have corresponded to the expectations at home, for the consul had no triumph; nevertheless, the energy which the Romans displayed in Sicily could not fail to make a great impression on the Sicilian Greeks. In the following year both consuls and an army twice as large entered the island unopposed. One of them, Marcus Valerius Maximus, afterwards called from this campaign the “hero of Messana” (-Messalla-), achieved a brilliant victory over the allied Carthaginians and Syracusans. After this battle the Phoenician army no longer ventured to keep the field against the Romans; Alaesa, Centuripa, and the smaller Greek towns generally fell to the victors, and Hiero himself abandoned the Carthaginian side and made peace and alliance with the Romans (491). He pursued a judicious policy in joining the Romans as soon as it appeared that their interference in Sicily was in earnest, and while there was still time to purchase peace without cessions and sacrifices. The intermediate states in Sicily, Syracuse and Messana, which were unable to follow out a policy of their own and had only the choice between Roman and Carthaginian hegemony, could not but at any rate prefer the former; because the Romans had very probably not as yet formed the design of conquering the island for themselves, but sought merely to prevent its being acquired by Carthage, and at all events Rome might be expected to substitute a more tolerable treatment and a due protection of commercial freedom for the tyrannizing and monopolizing system that Carthage pursued. Henceforth Hiero continued to be the most important, the steadiest, and the most esteemed ally of the Romans in the island.

Capture of Agrigentum

The Romans had thus gained their immediate object. By their double alliance with Messana and Syracuse, and the firm hold which they had on the whole east coast, they secured the means of landing on the island and of maintaining—which hitherto had been a very difficult matter—their armies there; and the war, which had previously been doubtful and hazardous, lost in a great measure its character of risk. Accordingly, no greater exertions were made for it than for the wars in Samnium and Etruria; the two legions which were sent over to the island for the next year (492) sufficed, in concert with the Sicilian Greeks, to drive the Carthaginians everywhere into their fortresses. The commander-in-chief of the Carthaginians, Hannibal son of Gisgo, threw himself with the flower of his troops into Agrigentum, to defend to the last that most important of the Carthaginian inland cities. Unable to storm a city so strong, the Romans blockaded it with entrenched lines and a double camp; the besieged, who numbered 50,000 soon suffered from want of provisions. To raise the siege the Carthaginian admiral Hanno landed at Heraclea, and cut off in turn the supplies from the Roman besieging force. On both sides the distress was great.

Page 466

At length a battle was resolved on, to put an end to the state of embarrassment and uncertainty. In this battle the Numidian cavalry showed itself just as superior to the Roman horse as the Roman infantry was superior to the Phoenician foot; the infantry decided the victory, but the losses even of the Romans were very considerable. The result of the successful struggle was somewhat marred by the circumstance that, after the battle, during the confusion and fatigue of the conquerors, the beleaguered army succeeded in escaping from the city and in reaching the fleet. The victory was nevertheless of importance; Agrigentum fell into the hands of the Romans, and thus the whole island was in their power, with the exception of the maritime fortresses, in which the Carthaginian general Hamilcar, Hanno's successor in command, entrenched himself to the teeth, and was not to be driven out either by force or by famine. The war was thenceforth continued only by sallies of the Carthaginians from the Sicilian fortresses and their descents on the Italian coasts.

Beginning of the Maritime War The Romans Build a Fleet

In fact, the Romans now for the first time felt the real difficulties of the war. If, as we are told, the Carthaginian diplomatists before the outbreak of hostilities warned the Romans not to push the matter to a breach, because against their will no Roman could even wash his hands in the sea, the threat was well founded. The Carthaginian fleet ruled the sea without a rival, and not only kept the coast towns of Sicily in due obedience and provided them with all necessaries, but also threatened a descent upon Italy, for which reason it was necessary in 492 to retain a consular army there. No invasion on a large scale occurred; but smaller Carthaginian detachments landed on the Italian coasts and levied contributions on the allies of Rome, and what was worst of all, completely paralyzed the commerce of Rome and her allies. The continuance of such a course for even a short time would suffice entirely to ruin Caere, Ostia, Neapolis, Tarentum, and Syracuse, while the Carthaginians easily consoled themselves for the loss of the tribute of Sicily with the contributions which they levied and the rich prizes of their privateering. The Romans now learned, what Dionysius, Agathocles, and Pyrrhus had learned before, that it was as difficult to conquer the Carthaginians as it was easy to beat them in the field. They saw that everything depended on procuring a fleet, and resolved to form one of twenty triremes and a hundred quinqueremes. The execution, however, of this energetic resolution was not easy. The representation originating in the schools of the rhetoricians, which would have us believe that the Romans then for the first time dipped their oars in water, is no doubt a childish tale; the mercantile marine of Italy must at this time have been very extensive, and there was no want even of Italian vessels of war. But these were war-barks

Page 467

and triremes, such as had been in use in earlier times; quinqueremes, which under the more modern system of naval warfare that had originated chiefly in Carthage were almost exclusively employed in the line, had not yet been built in Italy. The measure adopted by the Romans was therefore much as if a maritime state of the present day were to pass at once from the building of frigates and cutters to the building of ships of the line; and, just as in such a case now a foreign ship of the line would, if possible, be adopted as a pattern, the Romans referred their master shipbuilders to a stranded Carthaginian -penteres- as a model. No doubt the Romans, had they wished, might have sooner attained their object with the aid of the Syracusans and Massiliots; but their statesmen had too much sagacity to desire to defend Italy by means of a fleet not Italian. The Italian allies, however, were largely drawn upon both for the naval officers, who must have been for the most part taken from the Italian mercantile marine, and for the sailors, whose name (-socii navales-) shows that for a time they were exclusively furnished by the allies; along with these, slaves provided by the state and the wealthier families were afterwards employed, and ere long also the poorer class of burgesses. Under such circumstances, and when we take into account, as is but fair, on the one hand the comparatively low state of shipbuilding at that time, and on the other hand the energy of the Romans, there is nothing incredible in the statement that the Romans solved within a year the problem—which baffled Napoleon—of converting a continental into a maritime power, and actually launched their fleet of 120 sail in the spring of 494. It is true, that it was by no means a match for the Carthaginian fleet in numbers and efficiency at sea; and these were points of the greater importance, as the naval tactics of the period consisted mainly in manoeuvring. In the maritime warfare of that period hoplites and archers no doubt fought from the deck, and projectile machines were also plied from it; but the ordinary and really decisive mode of action consisted in running foul of the enemy's vessels, for which purpose the prows were furnished with heavy iron beaks: the vessels engaged were in the habit of sailing round each other till one or the other succeeded in giving the thrust, which usually proved decisive. Accordingly the crew of an ordinary Greek trireme, consisting of about 200 men, contained only about 10 soldiers, but on the other hand 170 rowers, from 50 to 60 on each deck; that of a quinquereme numbered about 300 rowers, and soldiers in proportion.

Page 468

The happy idea occurred to the Romans that they might make up for what their vessels, with their unpractised officers and crews, necessarily lacked in ability of manoeuvring, by again assigning a more considerable part in naval warfare to the soldiers. They stationed at the prow of each vessel a flying bridge, which could be lowered in front or on either side; it was furnished on both sides with parapets, and had space for two men in front. When the enemy's vessel was sailing up to strike the Roman one, or was lying alongside of it after the thrust had been evaded, the bridge on deck was suddenly lowered and fastened to its opponent by means of a grappling-iron: this not only prevented the running down, but enabled the Roman marines to pass along the bridge to the enemy's deck and to carry it by assault as in a conflict on land. No distinct body of marines was formed, but land troops were employed, when required, for this maritime service. In one instance as many as 120 legionaries fought in each ship on occasion of a great naval battle; in that case however the Roman fleet had at the same time a landing-army on board.

In this way the Romans created a fleet which was a match for the Carthaginians. Those err, who represent this building of a Roman fleet as a fairy tale, and besides they miss their aim; the feat must be understood in order to be admired. The construction of a fleet by the Romans was in very truth a noble national work—a work through which, by their clear perception of what was needful and possible, by ingenuity in invention, and by energy in resolution and in execution, they rescued their country from a position which was worse than at first it seemed.

Naval Victory at Mylae

The outset, nevertheless, was not favourable to the Romans. The Roman admiral, the consul Gnaeus Cornelius Scipio, who had sailed for Messana with the first seventeen vessels ready for sea (494), fancied, when on the voyage, that he should be able to capture Lipara by a coup de main. But a division of the Carthaginian fleet stationed at Panormus blockaded the harbour of the island where the Roman vessels rode at anchor, and captured the whole squadron along with the consul without a struggle. This, however, did not deter the main fleet from likewise sailing, as soon as its preparations were completed, for Messana. On its voyage along the Italian coast it fell in with a Carthaginian reconnoitring squadron of less strength, on which it had the good fortune to inflict a loss more than counterbalancing the first loss of the Romans; and thus successful and victorious it entered the port of Messana, where the second consul Gaius Duilius took the command in room of his captured colleague. At the promontory of Mylae, to the north-west of Messana, the Carthaginian fleet, that advanced from Panormus under the command of Hannibal, encountered the Roman, which here underwent its first trial on a great scale. The Carthaginians, seeing in

Page 469

the ill-sailing and unwieldy vessels of the Romans an easy prey, fell upon them in irregular order; but the newly invented boarding-bridges proved their thorough efficiency. The Roman vessels hooked and stormed those of the enemy as they came up one by one; they could not be approached either in front or on the sides without the dangerous bridge descending on the enemy's deck. When the battle was over, about fifty Carthaginian vessels, almost the half of the fleet, were sunk or captured by the Romans; among the latter was the ship of the admiral Hannibal, formerly belonging to king Pyrrhus. The gain was great; still greater the moral effect of the victory. Rome had suddenly become a naval power, and held in her hand the means of energetically terminating a war which threatened to be endlessly prolonged and to involve the commerce of Italy in ruin.

The War on the Coasts of Sicily and Sardinia

Two plans were open to the Romans. They might attack Carthage on the Italian islands and deprive her of the coast fortresses of Sicily and Sardinia one after another—a scheme which was perhaps practicable through well-combined operations by land and sea; and, in the event of its being accomplished, peace might either be concluded with Carthage on the basis of the cession of these islands, or, should such terms not be accepted or prove unsatisfactory, the second stage of the war might be transferred to Africa. Or they might neglect the islands and throw themselves at once with all their strength on Africa, not, in the adventurous style of Agathocles, burning their vessels behind them and staking all on the victory of a desperate band, but covering with a strong fleet the communications between the African invading army and Italy; and in that case a peace on moderate terms might be expected from the consternation of the enemy after the first successes, or, if the Romans chose, they might by pushing matters to an extremity compel the enemy to entire surrender.

They chose, in the first instance, the former plan of operations. In the year after the battle of Mylae (495) the consul Lucius Scipio captured the port of Aleria in Corsica—we still possess the tombstone of the general, which makes mention of this deed—and made Corsica a naval station against Sardinia. An attempt to establish a footing in Ulbia on the northern coast of that island failed, because the fleet wanted troops for landing. In the succeeding year (496) it was repeated with better success, and the open villages along the coast were plundered; but no permanent establishment of the Romans took place. Nor was greater progress made in Sicily. Hamilcar conducted the war with energy and adroitness, not only by force of arms on sea and land, but also by political proselytism. Of the numerous small country towns some every year fell away from the Romans, and had to be laboriously wrested afresh from the Phoenician grasp; while in the coast fortresses the Carthaginians maintained themselves

Page 470

without challenge, particularly in their headquarters of Panormus and in their new stronghold of Drepana, to which, on account of its easier defence by sea, Hamilcar had transferred the inhabitants of Eryx. A second great naval engagement off the promontory of Tyndaris (497), in which both parties claimed the victory, made no change in the position of affairs. In this way no progress was made, whether in consequence of the division and rapid change of the chief command of the Roman troops, which rendered the concentrated management of a series of operations on a small scale exceedingly difficult, or from the general strategical relations of the case, which certainly, as the science of war then stood, were unfavourable to the attacking party in general,(5) and particularly so to the Romans, who were still on the mere threshold of scientific warfare. Meanwhile, although the pillaging of the Italian coasts had ceased, the commerce of Italy suffered not much less than it had done before the fleet was built.

Attack on Africa Naval Victory of Ecnomus

Weary of a course of operations without results, and impatient to put an end to the war, the senate resolved to change its system, and to assail Carthage in Africa. In the spring of 498 a fleet of 330 ships of the line set sail for the coast of Libya: at the mouth of the river Himera on the south coast of Sicily it embarked the army for landing, consisting of four legions, under the charge of the two consuls Marcus Atilius Regulus and Lucius Manlius Volso, both experienced generals. The Carthaginian admiral suffered the embarkation of the enemy's troops to take place; but on continuing their voyage towards Africa the Romans found the Punic fleet drawn up in order of battle off Ecnomus to protect its native land from invasion. Seldom have greater numbers fought at sea than were engaged in the battle that now ensued. The Roman fleet: of 330 sail contained at least 100,000 men in its crews, besides the landing army of about 40,000; the Carthaginian of 350 vessels was manned by at least an equal number; so that well-nigh three hundred thousand men were brought into action on this day to decide the contest between the two mighty civic communities. The Phoenicians were placed in a single widely-extended line, with their left wing resting on the Sicilian coast. The Romans arranged themselves in a triangle, with the ships of the two consuls as admirals at the apex, the first and second squadrons drawn out in oblique line to the right and left, and a third squadron, having the vessels built for the transport of the cavalry in tow, forming the line which closed the triangle. They thus bore down in close order on the enemy. A fourth squadron placed in reserve followed more slowly. The wedge-shaped attack broke without difficulty the Carthaginian line, for its centre, which was first assailed, intentionally gave way, and the battle resolved itself into three separate engagements. While the admirals with

Page 471

the two squadrons drawn up on the wings pursued the Carthaginian centre and were closely engaged with it, the left wing of the Carthaginians drawn up along the coast wheeled round upon the third Roman squadron, which was prevented by the vessels which it had in tow from following the two others, and by a vehement onset in superior force drove it against the shore; at the same time the Roman reserve was turned on the open sea, and assailed from behind, by the right wing of the Carthaginians. The first of these three engagements was soon at an end; the ships of the Carthaginian centre, manifestly much weaker than the two Roman squadrons with which they were engaged, took to flight. Meanwhile the two other divisions of the Romans had a hard struggle with the superior enemy; but in close fighting the dreaded boarding-bridges stood them in good stead, and by this means they succeeded in holding out till the two admirals with their vessels could come up. By their arrival the Roman reserve was relieved, and the Carthaginian vessels of the right wing retired before the superior force. And now, when this conflict had been decided in favour of the Romans, all the Roman vessels that still could keep the sea fell on the rear of the Carthaginian left wing, which was obstinately following up its advantage, so that it was surrounded and almost all the vessels composing it were taken. The losses otherwise were nearly equal. Of the Roman fleet 24 sail were sunk; of the Carthaginian 30 were sunk, and 64 were taken.

Landing of Regulus in Africa

Notwithstanding its considerable loss, the Carthaginian fleet did not give up the protection of Africa, and with that view returned to the gulf of Carthage, where it expected the descent to take place and purposed to give battle a second time. But the Romans landed, not on the western side of the peninsula which helps to form the gulf, but on the eastern side, where the bay of Clupea presented a spacious harbour affording protection in almost all winds, and the town, situated close by the sea on a shield-shaped eminence rising out of the plain, supplied an excellent defence for the harbour. They disembarked the troops without hindrance from the enemy, and established themselves on the hill; in a short time an entrenched naval camp was constructed, and the land army was at liberty to commence operations. The Roman troops ranged over the country and levied contributions: they were able to send as many as 20,000 slaves to Rome. Through the rarest good fortune the bold scheme had succeeded at the first stroke, and with but slight sacrifices: the end seemed attained. The feeling of confidence that in this respect animated the Romans is evinced by the resolution of the senate to recall to Italy the greater portion of the fleet and half of the army; Marcus Regulus alone remained in Africa with 40 ships, 15,000 infantry, and 500 cavalry. Their confidence, however, was seemingly not overstrained. The Carthaginian army, which

Page 472

was disheartened, did not venture forth into the plain, but waited to sustain discomfiture in the wooded defiles, in which it could make no use of its two best arms, the cavalry and the elephants. The towns surrendered -en masse-; the Numidians rose in insurrection, and overran the country far and wide. Regulus might hope to begin the next campaign with the siege of the capital, and with that view he pitched his camp for the winter in its immediate vicinity at Tunes.

Vain Negotiations for Peace

The spirit of the Carthaginians was broken: they sued for peace. But the conditions which the consul proposed—not merely the cession of Sicily and Sardinia, but the conclusion of an alliance on unequal terms with Rome, which would have bound the Carthaginians to renounce a war-marine of their own and to furnish vessels for the Roman wars—conditions which would have placed Carthage on a level with Neapolis and Tarentum, could not be accepted, so long as a Carthaginian army kept the field and a Carthaginian fleet kept the sea, and the capital stood unshaken.

Preparations of Carthage

The mighty enthusiasm, which is wont to blaze up nobly among Oriental nations, even the most abased, on the approach of extreme peril—the energy of dire necessity—impelled the Carthaginians to exertions, such as were by no means expected from a nation of shopkeepers. Hamilcar, who had carried on the guerilla war against the Romans in Sicily with so much success, appeared in Libya with the flower of the Sicilian troops, which furnished an admirable nucleus for the newly-levied force. The connections and gold of the Carthaginians, moreover, brought to them excellent Numidian horsemen in troops, and also numerous Greek mercenaries; amongst whom was the celebrated captain Xanthippus of Sparta, whose talent for organization and strategical skill were of great service to his new masters.(6) While the Carthaginians were thus making their preparations in the course of the winter, the Roman general remained inactive at Tunes. Whether it was that he did not anticipate the storm which was gathering over his head, or that a sense of military honour prohibited him from doing what his position demanded—instead of renouncing a siege which he was not in a condition even to attempt, and shutting himself up in the stronghold of Clupea, he remained with a handful of men before the walls of the hostile capital, neglecting even to secure his line of retreat to the naval camp, and neglecting to provide himself with—what above all he wanted, and what might have been so easily obtained through negotiation with the revolted Numidian tribes—a good light cavalry. He thus wantonly brought himself and his army into a plight similar to that which formerly befell Agathocles in his desperate adventurous expedition.

Defeat of Regulus

Page 473

When spring came (499), the state of affairs had so changed, that now the Carthaginians were the first to take the field and to offer battle to the Romans. It was natural that they should do so, for everything depended on their getting quit of the army of Regulus, before reinforcements could arrive from Italy. The same reason should have led the Romans to desire delay; but, relying on their invincibleness in the open field, they at once accepted battle notwithstanding their inferiority of strength—for, although the numbers of the infantry on both sides were nearly the same, their 4000 cavalry and 100 elephants gave to the Carthaginians a decided superiority—and notwithstanding the unfavourable nature of the ground, the Carthaginians having taken up their position in a broad plain presumably not far from Tunes. Xanthippus, who on this day commanded the Carthaginians, first threw his cavalry on that of the enemy, which was stationed, as usual, on the two flanks of the line of battle; the few squadrons of the Romans were scattered like dust in a moment before the masses of the enemy's horse, and the Roman infantry found itself outflanked by them and surrounded. The legions, unshaken by their apparent danger, advanced to attack the enemy's line; and, although the row of elephants placed as a protection in front of it checked the right wing and centre of the Romans, the left wing at any rate, marching past the elephants, engaged the mercenary infantry on the right of the enemy, and overthrew them completely. But this very success broke up the Roman ranks. The main body indeed, assailed by the elephants in front and by the cavalry on the flanks and in the rear, formed square, and defended itself with heroic courage, but the close masses were at length broken and swept away. The victorious left wing encountered the still fresh Carthaginian centre, where the Libyan infantry prepared a similar fate for it. From the nature of the ground and the superior numbers of the enemy's cavalry, all the combatants in these masses were cut down or taken prisoners; only two thousand men, chiefly, in all probability, the light troops and horsemen who were dispersed at the commencement, gained—while the Roman legions stood to be slaughtered—a start sufficient to enable them with difficulty to reach Clupea. Among the few prisoners was the consul himself, who afterwards died in Carthage; his family, under the idea that he had not been treated by the Carthaginians according to the usages of war, wreaked a most revolting vengeance on two noble Carthaginian captives, till even the slaves were moved to pity, and on their information the tribunes put a stop to the shameful outrage. (7)

Evacuation of Africa

Page 474

When the terrible news reached Rome, the first care of the Romans was naturally directed to the saving of the force shut up in Clupea. A Roman fleet of 350 sail immediately started, and after a noble victory at the Hermaean promontory, in which the Carthaginians lost 114 ships, it reached Clupea just in time to deliver from their hard-pressed position the remains of the defeated army which were there entrenched. Had it been despatched before the catastrophe occurred, it might have converted the defeat into a victory that would probably have put an end to the Punic wars. But so completely had the Romans now lost their judgment, that after a successful conflict before Clupea they embarked all their troops and sailed home, voluntarily evacuating that important and easily defended position which secured to them facilities for landing in Africa, and abandoning their numerous African allies without protection to the vengeance of the Carthaginians. The Carthaginians did not neglect the opportunity of filling their empty treasury, and of making their subjects clearly understand the consequences of unfaithfulness. An extraordinary contribution of 1000 talents of silver (244,000 pounds) and 20,000 oxen was levied, and the sheiks in all the communities that had revolted were crucified; it is said that there were three thousand of them, and that this revolting atrocity on the part of the Carthaginian authorities really laid the foundation of the revolution which broke forth in Africa some years later. Lastly, as if to fill up the measure of misfortune to the Romans even as their measure of success had been filled before, on the homeward voyage of the fleet three-fourths of the Roman vessels perished with their crews in a violent storm; only eighty reached their port (July 499). The captains had foretold the impending mischief, but the extemporised Roman admirals had nevertheless given orders to sail.

Recommencement of the War in Sicily

After successes so immense the Carthaginians were able to resume their offensive operations, which had long been in abeyance. Hasdrubal son of Hanno landed at Lilybaeum with a strong force, which was enabled, particularly by its enormous number of elephants—amounting to 140—to keep the field against the Romans: the last battle had shown that it was possible to make up for the want of good infantry to some extent by elephants and cavalry. The Romans also resumed the war in Sicily; the annihilation of their invading army had, as the voluntary evacuation of Clupea shows, at once restored ascendancy in the senate to the party which was opposed to the war in Africa and was content with the gradual subjugation of the islands. But for this purpose too there was need of a fleet; and, since that which had conquered at Mylae, at Ecnomus, and at the Hermaean promontory was destroyed, they built a new one. Keels were at once laid down for 220 new vessels of war—they had never hitherto undertaken the building of so many simultaneously—and

Page 475

in the incredibly short space of three months they were all ready for sea. In the spring of 500 the Roman fleet, numbering 300 vessels mostly new, appeared on the north coast of Sicily; Panormus, the most important town in Carthaginian Sicily, was acquired through a successful attack from the seaboard, and the smaller places there, Soluntum, Cephaloedium, and Tyndaris, likewise fell into the hands of the Romans, so that along the whole north coast of the island Thermae alone was retained by the Carthaginians. Panormus became thenceforth one of the chief stations of the Romans in Sicily. The war by land, nevertheless, made no progress; the two armies stood face to face before Lilybaeum, but the Roman commanders, who knew not how to encounter the mass of elephants, made no attempt to compel a pitched battle.

In the ensuing year (501) the consuls, instead of pursuing sure advantages in Sicily, preferred to make an expedition to Africa, for the purpose not of landing but of plundering the coast towns. They accomplished their object without opposition; but, after having first run aground in the troublesome, and to their pilots unknown, waters of the Lesser Syrtis, whence they with difficulty got clear again, the fleet encountered a storm between Sicily and Italy, which cost more than 150 ships. On this occasion also the pilots, notwithstanding their representations and entreaties to be allowed to take the course along the coast, were obliged by command of the consuls to steer straight from Panormus across the open sea to Ostia.

Suspension of the Maritime War Roman Victory at Panormus

Despondency now seized the fathers of the city; they resolved to reduce their war-fleet to sixty sail, and to confine the war by sea to the defence of the coasts, and to the convoy of transports. Fortunately, just at this time, the languishing war in Sicily took a more favourable turn. In the year 502, Thermae, the last point which the Carthaginians held on the north coast, and the important island of Lipara, had fallen into the hands of the Romans, and in the following year (summer of 503) the consul Lucius Caecilius Metellus achieved a brilliant victory over the army of elephants under the walls of Panormus. These animals, which had been imprudently brought forward, were wounded by the light troops of the Romans stationed in the moat of the town; some of them fell into the moat, and others fell back on their own troops, who crowded in wild disorder along with the elephants towards the beach, that they might be picked up by the Phoenician ships. One hundred and twenty elephants were captured, and the Carthaginian army, whose strength depended on these animals, was obliged once more to shut itself up in its fortresses. Eryx soon fell into the hands of the Romans (505), and the Carthaginians retained nothing in the island but Drepana and Lilybaeum. Carthage a second time offered peace; but the victory of Metellus and the exhaustion of the enemy gave to the more energetic party the upper hand in the senate.

Page 476

Siege of Lilybaeum

Peace was declined, and it was resolved to prosecute in earnest the siege of the two Sicilian cities and for this purpose to send to sea once more a fleet of 200 sail. The siege of Lilybaeum, the first great and regular siege undertaken by Rome, and one of the most obstinate known in history, was opened by the Romans with an important success: they succeeded in introducing their fleet into the harbour of the city, and in blockading it on the side facing the sea. The besiegers, however, were not able to close the sea completely. In spite of their sunken vessels and their palisades, and in spite of the most careful vigilance, dexterous mariners, accurately acquainted with the shallows and channels, maintained with swift-sailing vessels a regular communication between the besieged in the city and the Carthaginian fleet in the harbour of Drepana. In fact after some time a Carthaginian squadron of 50 sail succeeded in running into the harbour, in throwing a large quantity of provisions and a reinforcement of 10,000 men into the city, and in returning unmolested. The besieging land army was not much more fortunate. They began with a regular attack; machines were erected, and in a short time the batteries had demolished six of the towers flanking the walls, so that the breach soon appeared to be practicable. But the able Carthaginian commander Himilco parried this assault by giving orders for the erection of a second wall behind the breach. An attempt of the Romans to enter into an understanding with the garrison was likewise frustrated in proper time. And, after a first sally made for the purpose of burning the Roman set of machines had been repulsed, the Carthaginians succeeded during a stormy night in effecting their object. Upon this the Romans abandoned their preparations for an assault, and contented themselves with blockading the walls by land and water. The prospect of success in this way was indeed very remote, so long as they were unable wholly to preclude the entrance of the enemy's vessels; and the army of the besiegers was in a condition not much better than that of the besieged in the city, because their supplies were frequently cut off by the numerous and bold light cavalry of the Carthaginians, and their ranks began to be thinned by the diseases indigenous to that unwholesome region. The capture of Lilybaeum, however, was of sufficient importance to induce a patient perseverance in the laborious task, which promised to be crowned in time with the desired success.

Defeat of the Roman Fleet before Drepana
Annihilation of the Roman Transport Fleet

Page 477

But the new consul Publius Claudius considered the task of maintaining the investment of Lilybaeum too trifling: he preferred to change once more the plan of operations, and with his numerous newly-manned vessels suddenly to surprise the Carthaginian fleet which was waiting in the neighbouring harbour of Drepana. With the whole blockading squadron, which had taken on board volunteers from the legions, he started about midnight, and sailing in good order with his right wing by the shore, and his left in the open sea, he safely reached the harbour of Drepana at sunrise. Here the Phoenician admiral Atarbas was in command. Although surprised, he did not lose his presence of mind or allow himself to be shut up in the harbour, but as the Roman ships entered the harbour, which opens to the south in the form of a sickle, on the one side, he withdrew his vessels from it by the opposite side which was still free, and stationed them in line on the outside. No other course remained to the Roman admiral but to recall as speedily as possible the foremost vessels from the harbour, and to make his arrangements for battle in like manner in front of it; but in consequence of this retrograde movement he lost the free choice of his position, and was obliged to accept battle in a line, which on the one hand was outflanked by that of the enemy to the extent of five ships—for there was not time fully to deploy the vessels as they issued from the harbour—and on the other hand was crowded so close on the shore that his vessels could neither retreat, nor sail behind the line so as to come to each other's aid. Not only was the battle lost before it began, but the Roman fleet was so completely ensnared that it fell almost wholly into the hands of the enemy. The consul indeed escaped, for he was the first who fled; but 93 Roman vessels, more than three-fourths of the blockading fleet, with the flower of the Roman legions on board, fell into the hands of the Phoenicians. It was the first and only great naval victory which the Carthaginians gained over the Romans. Lilybaeum was practically relieved on the side towards the sea, for though the remains of the Roman fleet returned to their former position, they were now much too weak seriously to blockade a harbour which had never been wholly closed, and they could only protect themselves from the attack of the Carthaginian ships with the assistance of the land army. That single imprudent act of an inexperienced and criminally thoughtless officer had thrown away all that had been with so much difficulty attained by the long and galling warfare around the fortress; and those war-vessels of the Romans which his presumption had not forfeited were shortly afterwards destroyed by the folly of his colleague.

Page 478

The second consul, Lucius Junius Pullus, who had received the charge of lading at Syracuse the supplies destined for the army at Lilybaeum, and of convoying the transports along the south coast of the island with a second Roman fleet of 120 war-vessels, instead of keeping his ships together, committed the error of allowing the first convoy to depart alone and of only following with the second. When the Carthaginian vice-admiral, Carthalo, who with a hundred select ships blockaded the Roman fleet in the port of Lilybaeum, received the intelligence, he proceeded to the south coast of the island, cut off the two Roman squadrons from each other by interposing between them, and compelled them to take shelter in two harbours of refuge on the inhospitable shores of Gela and Camarina. The attacks of the Carthaginians were indeed bravely repulsed by the Romans with the help of the shore batteries, which had for some time been erected there as everywhere along the coast; but, as the Romans could not hope to effect a junction and continue their voyage, Carthalo could leave the elements to finish his work. The next great storm, accordingly, completely annihilated the two Roman fleets in their wretched roadsteads, while the Phoenician admiral easily weathered it on the open sea with his unencumbered and well-managed ships. The Romans, however, succeeded in saving the greater part of the crews and cargoes (505).

Perplexity of the Romans

The Roman senate was in perplexity. The war had now reached its sixteenth year; and they seemed to be farther from their object in the sixteenth than in the first. In this war four large fleets had perished, three of them with Roman armies on board; a fourth select land army had been destroyed by the enemy in Libya; to say nothing of the numerous losses which had been occasioned by the minor naval engagements, and by the battles, and still more by the outpost warfare and the diseases, of Sicily.

What a multitude of human lives the war swept away may be seen from the fact, that the burgess-roll merely from 502 to 507 decreased by about 40,000, a sixth part of the entire number; and this does not include the losses of the allies, who bore the whole brunt of the war by sea, and, in addition, at least an equal proportion with the Romans of the warfare by land. Of the financial loss it is not possible to form any conception; but both the direct damage sustained in ships and -materiel-, and the indirect injury through the paralyzing of trade, must have been enormous. An evil still greater than this was the exhaustion of all the methods by which they had sought to terminate the war. They had tried a landing in Africa with their forces fresh and in the full career of victory, and had totally failed. They had undertaken to storm Sicily town by town; the lesser places had fallen, but the two mighty naval strongholds of Lilybaeum and Drepana stood more invincible than ever. What were they to do? In fact, there was to

Page 479

some extent reason for despondency. The fathers of the city became faint-hearted; they allowed matters simply to take their course, knowing well that a war protracted without object or end was more pernicious for Italy than the straining of the last man and the last penny, but without that courage and confidence in the nation and in fortune, which could demand new sacrifices in addition to those that had already been lavished in vain. They dismissed the fleet; at the most they encouraged privateering, and with that view placed the war-vessels of the state at the disposal of captains who were ready to undertake a piratical warfare on their own account. The war by land was continued nominally, because they could not do otherwise; but they were content with observing the Sicilian fortresses and barely maintaining what they possessed,—measures which, in the absence of a fleet, required a very numerous army and extremely costly preparations.

Now, if ever, the time had come when Carthage was in a position to humble her mighty antagonist. She, too, of course must have felt some exhaustion of resources; but, in the circumstances, the Phoenician finances could not possibly be so disorganized as to prevent the Carthaginians from continuing the war—which cost them little beyond money—offensively and with energy. The Carthaginian government, however, was not energetic, but on the contrary weak and indolent, unless impelled to action by an easy and sure gain or by extreme necessity. Glad to be rid of the Roman fleet, they foolishly allowed their own also to fall into decay, and began after the example of the enemy to confine their operations by land and sea to the petty warfare in and around Sicily.

Petty War in Sicily Hamilcar Barcas

Thus there ensued six years of uneventful warfare (506-511), the most inglorious in the history of this century for Rome, and inglorious also for the Carthaginian people. One man, however, among the latter thought and acted differently from his nation. Hamilcar, named Barak or Barcas (i. e. lightning), a young officer of much promise, took over the supreme command in Sicily in the year 507. His army, like every Carthaginian one, was defective in a trustworthy and experienced infantry; and the government, although it was perhaps in a position to create such an infantry and at any rate was bound to make the attempt, contented itself with passively looking on at its defeats or at most with nailing the defeated generals to the cross. Hamilcar resolved to take the matter into his own hands. He knew well that his mercenaries were as indifferent to Carthage as to Rome, and that he had to expect from his government not Phoenician or Libyan conscripts, but at the best a permission to save his country with his troops in his own way, provided it cost nothing. But he knew himself also, and he knew men. His mercenaries cared nothing for Carthage; but a true general is able to

Page 480

substitute his own person for his country in the affections of his soldiers; and such an one was this young commander. After he had accustomed his men to face the legionaries in the warfare of outposts before Drepana and Lilybaeum, he established himself with his force on Mount Ercte (Monte Pellegrino near Palermo), which commands like a fortress the neighbouring country; and making them settle there with their wives and children, levied contributions from the plains, while Phoenician privateers plundered the Italian coast as far as Cumae. He thus provided his people with copious supplies without asking money from the Carthaginians, and, keeping up the communication with Drepana by sea, he threatened to surprise the important town of Panormus in his immediate vicinity. Not only were the Romans unable to expel him from his stronghold, but after the struggle had lasted awhile at Ercte, Hamilcar formed for himself another similar position at Eryx. This mountain, which bore half-way up the town of the same name and on its summit the temple of Aphrodite, had been hitherto in the hands of the Romans, who made it a basis for annoying Drepana. Hamilcar deprived them of the town and besieged the temple, while the Romans in turn blockaded him from the plain. The Celtic deserters from the Carthaginian army who were stationed by the Romans at the forlorn post of the temple—a reckless pack of marauders, who in the course of this siege plundered the temple and perpetrated every sort of outrage—defended the summit of the rock with desperate courage; but Hamilcar did not allow himself to be again dislodged from the town, and kept his communications constantly open by sea with the fleet and the garrison of Drepana. The war in Sicily seemed to be assuming a turn more and more unfavourable for the Romans. The Roman state was losing in that warfare its money and its soldiers, and the Roman generals their repute; it was already clear that no Roman general was a match for Hamilcar, and the time might be calculated when even the Carthaginian mercenary would be able boldly to measure himself against the legionary. The privateers of Hamilcar appeared with ever-increasing audacity on the Italian coast: already a praetor had been obliged to take the field against a band of Carthaginian rovers which had landed there. A few years more, and Hamilcar might with his fleet have accomplished from Sicily what his son subsequently undertook by the land route from Spain.

A Fleet Built by the Romans Victory of Catulus at the Island Aegusa

The Roman senate, however, persevered in its inaction; the desponding party for once had the majority there. At length a number of sagacious and high-spirited men determined to save the state even without the interposition of the government, and to put an end to the ruinous Sicilian war. Successful corsair expeditions, if they had not raised the courage of the nation, had aroused energy and hope in a portion

Page 481

of the people; they had already joined together to form a squadron, burnt down Hippo on the African coast, and sustained a successful naval conflict with the Carthaginians off Panormus. By a private subscription—such as had been resorted to in Athens also, but not on so magnificent a scale—the wealthy and patriotic Romans equipped a war fleet, the nucleus of which was supplied by the ships built for privateering and the practised crews which they contained, and which altogether was far more carefully fitted out than had hitherto been the case in the shipbuilding of the state. This fact—that a number of citizens in the twenty-third year of a severe war voluntarily presented to the state two hundred ships of the line, manned by 60,000 sailors—stands perhaps unparalleled in the annals of history. The consul Gaius Lutatius Catulus, to whom fell the honour of conducting this fleet to the Sicilian seas, met there with almost no opposition: the two or three Carthaginian vessels, with which Hamilcar had made his corsair expeditions, disappeared before the superior force, and almost without resistance the Romans occupied the harbours of Lilybaeum and Drepana, the siege of which was now undertaken with energy by water and by land. Carthage was completely taken by surprise; even the two fortresses, weakly provisioned, were in great danger. A fleet was equipped at home; but with all the haste which they displayed, the year came to an end without any appearance of Carthaginian sails in the Sicilian waters; and when at length, in the spring of 513, the hurriedly-prepared vessels appeared in the offing of Drepana, they deserved the name of a fleet of transports rather than that of a war fleet ready for action. The Phoenicians had hoped to land undisturbed, to disembark their stores, and to be able to take on board the troops requisite for a naval battle; but the Roman vessels intercepted them, and forced them, when about to sail from the island of Hieria (now Maritima) for Drepana, to accept battle near the little island of Aegusa (Favignana) (10 March, 513). The issue was not for a moment doubtful; the Roman fleet, well built and manned, and admirably handled by the able praetor Publius Valerius Falto (for a wound received before Drepana still confined the consul Catulus to his bed), defeated at the first blow the heavily laden and poorly and inadequately manned vessels of the enemy; fifty were sunk, and with seventy prizes the victors sailed into the port of Lilybaeum. The last great effort of the Roman patriots had borne fruit; it brought victory, and with victory peace.

Conclusion of Peace

Page 482

The Carthaginians first crucified the unfortunate admiral—a step which did not alter the position of affairs—and then dispatched to the Sicilian general unlimited authority to conclude a peace. Hamilcar, who saw his heroic labours of seven years undone by the fault of others, magnanimously submitted to what was inevitable without on that account sacrificing either his military honour, or his nation, or his own designs. Sicily indeed could not be retained, seeing that the Romans had now command of the sea; and it was not to be expected that the Carthaginian government, which had vainly endeavoured to fill its empty treasury by a state-loan in Egypt, would make even any further attempt to vanquish the Roman fleet. He therefore surrendered Sicily. The independence and integrity of the Carthaginian state and territory, on the other hand, were expressly recognized in the usual form; Rome binding herself not to enter into a separate alliance with the confederates of Carthage, and Carthage engaging not to enter into separate alliance with the confederates of Rome,—that is, with their respective subject and dependent communities; neither was to commence war, or exercise rights of sovereignty, or undertake recruiting within the other's dominions.(8) The secondary stipulations included, of course, the gratuitous return of the Roman prisoners of war and the payment of a war contribution; but the demand of Catulus that Hamilcar should deliver up his arms and the Roman deserters was resolutely refused by the Carthaginian, and with success. Catulus desisted from his second request, and allowed the Phoenicians a free departure from Sicily for the moderate ransom of 18 -denarii- (12 shillings) per man.

If the continuance of the war appeared to the Carthaginians undesirable, they had reason to be satisfied with these terms. It may be that the natural wish to bring to Rome peace as well as triumph, the recollection of Regulus and of the many vicissitudes of the war, the consideration that such a patriotic effort as had at last decided the victory could neither be enjoined nor repeated, perhaps even the personal character of Hamilcar, concurred in influencing the Roman general to yield so much as he did. It is certain that there was dissatisfaction with the proposals of peace at Rome, and the assembly of the people, doubtless under the influence of the patriots who had accomplished the equipment of the last fleet, at first refused to ratify it. We do not know with what view this was done, and therefore we are unable to decide whether the opponents of the proposed peace in reality rejected it merely for the purpose of exacting some further concessions from the enemy, or whether, remembering that Regulus had summoned Carthage to surrender her political independence, they were resolved to continue the war till they had gained that end—so that it was no longer a question of peace, but a question of conquest. If the refusal took place with

Page 483

the former view, it was presumably mistaken; compared with the gain of Sicily every other concession was of little moment, and looking to the determination and the inventive genius of Hamilcar, it was very rash to stake the securing of the principal gain on the attainment of secondary objects. If on the other hand the party opposed to the peace regarded the complete political annihilation of Carthage as the only end of the struggle that would satisfy the Roman community, it showed political tact and anticipation of coming events; but whether the resources of Rome would have sufficed to renew the expedition of Regulus and to follow it up as far as might be required not merely to break the courage but to breach the walls of the mighty Phoenician city, is another question, to which no one now can venture to give either an affirmative or a negative answer. At last the settlement of the momentous question was entrusted to a commission which was to decide it upon the spot in Sicily. It confirmed the proposal in substance; only, the sum to be paid by Carthage for the costs of the war was raised to 3200 talents (790,000 pounds), a third of which was to be paid down at once, and the remainder in ten annual instalments. The definitive treaty included, in addition to the surrender of Sicily, the cession also of the islands between Sicily and Italy, but this can only be regarded as an alteration of detail made on revision; for it is self-evident that Carthage, when surrendering Sicily, could hardly desire to retain the island of Lipara which had long been occupied by the Roman fleet, and the suspicion, that an ambiguous stipulation was intentionally introduced into the treaty with reference to Sardinia and Corsica, is unworthy and improbable.

Thus at length they came to terms. The unconquered general of a vanquished nation descended from the mountains which he had defended so long, and delivered to the new masters of the island the fortresses which the Phoenicians had held in their uninterrupted possession for at least four hundred years, and from whose walls all assaults of the Hellenes had recoiled unsuccessful. The west had peace (513).

Remarks on the Roman Conduct of the War

Let us pause for a moment over the conflict, which extended the dominion of Rome beyond the circling sea that encloses the peninsula. It was one of the longest and most severe which the Romans ever waged; many of the soldiers who fought in the decisive battle were unborn when the contest began. Nevertheless, despite the incomparably noble incidents which it now and again presented, we can scarcely name any war which the Romans managed so wretchedly and with such vacillation, both in a military and in a political point of view. It could hardly be otherwise. The contest occurred amidst a transition in their political system—the transition from an Italian policy, which no longer sufficed, to the policy befitting a great state, which had not yet been found.

Page 484

The Roman senate and the Roman military system were excellently organized for a purely Italian policy. The wars which such a policy provoked were purely continental wars, and always rested on the capital situated in the middle of the peninsula as the ultimate basis of operations, and proximately on the chain of Roman fortresses. The problems to be solved were mainly tactical, not strategical; marches and operations occupied but a subordinate, battles held the first, place; fortress warfare was in its infancy; the sea and naval war hardly crossed men's thoughts even incidentally. We can easily understand—especially if we bear in mind that in the battles of that period, where the naked weapon predominated, it was really the hand-to-hand encounter that proved decisive—how a deliberative assembly might direct such operations, and how any one who just was burgomaster might command the troops. All this was changed in a moment. The field of battle stretched away to an incalculable distance, to the unknown regions of another continent, and beyond a broad expanse of sea; every wave was a highway for the enemy; from any harbour he might be expected to issue for his onward march. The siege of strong places, particularly maritime fortresses, in which the first tacticians of Greece had failed, had now for the first time to be attempted by the Romans. A land army and the system of a civic militia no longer sufficed. It was essential to create a fleet, and, what was more difficult, to employ it; it was essential to find out the true points of attack and defence, to combine and to direct masses, to calculate expeditions extending over long periods and great distances, and to adjust their co-operation; if these things were not attended to, even an enemy far weaker in the tactics of the field might easily vanquish a stronger opponent. Is there any wonder that the reins of government in such an exigency slipped from the hands of a deliberative assembly and of commanding burgomasters?

It was plain, that at the beginning of the war the Romans did not know what they were undertaking; it was only during the course of the struggle that the inadequacies of their system, one after another, forced themselves on their notice—the want of a naval power, the lack of fixed military leadership, the insufficiency of their generals, the total uselessness of their admirals. In part these evils were remedied by energy and good fortune; as was the case with the want of a fleet. That mighty creation, however, was but a grand makeshift, and always remained so. A Roman fleet was formed, but it was rendered national only in name, and was always treated with the affection of a stepmother; the naval service continued to be little esteemed in comparison with the high honour of serving in the legions; the naval officers were in great part Italian Greeks; the crews were composed of subjects or even of slaves and outcasts. The Italian farmer was at all times distrustful of

Page 485

the sea; and of the three things in his life which Cato regretted one was, that he had travelled by sea when he might have gone by land. This result arose partly out of the nature of the case, for the vessels were oared galleys and the service of the oar can scarcely be ennobled; but the Romans might at least have formed separate legions of marines and taken steps towards the rearing of a class of Roman naval officers. Taking advantage of the impulse of the nation, they should have made it their aim gradually to establish a naval force important not only in numbers but in sailing power and practice, and for such a purpose they had a valuable nucleus in the privateering that was developed during the long war; but nothing of the sort was done by the government. Nevertheless the Roman fleet with its unwieldy grandeur was the noblest creation of genius in this war, and, as at its beginning, so at its close it was the fleet that turned the scale in favour of Rome.

Far more difficult to be overcome were those deficiencies, which could not be remedied without an alteration of the constitution. That the senate, according to the strength of the contending parties within it, should leap from one system of conducting the war to another, and perpetrate errors so incredible as the evacuation of Clupea and the repeated dismantling of the fleet; that the general of one year should lay siege to Sicilian towns, and his successor, instead of compelling them to surrender, should pillage the African coast or think proper to risk a naval battle; and that at any rate the supreme command should by law change hands every year—all these anomalies could not be done away without stirring constitutional questions the solution of which was more difficult than the building of a fleet, but as little could their retention be reconciled with the requirements of such a war. Above all, moreover, neither the senate nor the generals could at once adapt themselves to the new mode of conducting war. The campaign of Regulus is an instance how singularly they adhered to the idea that superiority in tactics decides everything. There are few generals who have had such successes thrown as it were into their lap by fortune: in the year 498 he stood precisely where Scipio stood fifty years later, with this difference, that he had no Hannibal and no experienced army arrayed against him. But the senate withdrew half the army, as soon as they had satisfied themselves of the tactical superiority of the Romans; in blind reliance on that superiority the general remained where he was, to be beaten in strategy, and accepted battle when it was offered to him, to be beaten also in tactics. This was the more remarkable, as Regulus was an able and experienced general of his kind. The rustic method of warfare, by which Etruria and Samnium had been won, was the very cause of the defeat in the plain of Tunes. The principle, quite right in its own province, that every true burgher is fit for

Page 486

a general, was no longer applicable; the new system of war demanded the employment of generals who had a military training and a military eye, and every burgomaster had not those qualities. The arrangement was however still worse, by which the chief command of the fleet was treated as an appanage to the chief command of the land army, and any one who chanced to be president of the city thought himself able to act the part not of general only, but of admiral too. The worst disasters which Rome suffered in this war were due not to the storms and still less to the Carthaginians, but to the presumptuous folly of its own citizen-admirals.

Rome was victorious at last. But her acquiescence in a gain far less than had at first been demanded and indeed offered, as well as the energetic opposition which the peace encountered in Rome, very clearly indicate the indecisive and superficial character of the victory and of the peace; and if Rome was the victor, she was indebted for her victory in part no doubt to the favour of the gods and to the energy of her citizens, but still more to the errors of her enemies in the conduct of the war—errors far surpassing even her own.

Notes for Chapter II

1. II. V. Campanian Hellenism
2. II. VII. Submission of Lower Italy
3. The Mamertines entered quite into the same position towards Rome as the Italian communities, bound themselves to furnish ships (Cic. Verr. v. 19, 50), and, as the coins show, did not possess the right of coining silver.
4. II. VII. Submission of Lower Italy
5. II. VII. Last Struggles in Italy
6. The statement, that the military talent of Xanthippus was the primary means of saving Carthage, is probably coloured; the officers of Carthage can hardly have waited for foreigners to teach them that the light African cavalry could be more appropriately employed on the plain than among hills and forests. From such stories, the echo of the talk of Greek guardrooms, even Polybius is not free. The statement that Xanthippus was put to death by the Carthaginians after the victory, is a fiction; he departed voluntarily, perhaps to enter the Egyptian service.
7. Nothing further is known with certainty as to the end of Regulus; even his mission to Rome—which is sometimes placed in 503, sometimes in 513—is very ill attested. The later Romans, who sought in the fortunes and misfortunes of their forefathers mere

materials for school themes, made Regulus the prototype of heroic misfortune as they made Fabricius the prototype of heroic poverty, and put into circulation in his name a number of anecdotes invented by way of due accompaniment—incongruous embellishments, contrasting ill with serious and sober history.

8. The statement (Zon. viii. 17) that the Carthaginians had to promise that they would not send any vessels of war into the territories of the Roman symmarchy—and therefore not to Syracuse, perhaps even not to Massilia—sounds credible enough; but the text of the treaty says nothing of it (Polyb. iii. 27).

Page 487

CHAPTER III

The Extension of Italy to Its Natural Boundaries

Natural Boundaries of Italy

The Italian confederacy as it emerged from the crises of the fifth century—or, in other words, the State of Italy—united the various civic and cantonal communities from the Apennines to the Ionian Sea under the hegemony of Rome. But before the close of the fifth century these limits were already overpassed in both directions, and Italian communities belonging to the confederacy had sprung up beyond the Apennines and beyond the sea. In the north the republic, in revenge for ancient and recent wrongs, had already in 471 annihilated the Celtic Senones; in the south, through the great war from 490 to 513, it had dislodged the Phoenicians from the island of Sicily. In the north there belonged to the combination headed by Rome the Latin town of Ariminum (besides the burgess-settlement of Sena), in the south the community of the Mamertines in Messina, and as both were nationally of Italian origin, so both shared in the common rights and obligations of the Italian confederacy. It was probably the pressure of events at the moment rather than any comprehensive political calculation, that gave rise to these extensions of the confederacy; but it was natural that now at least, after the great successes achieved against Carthage, new and wider views of policy should dawn upon the Roman government—views which even otherwise were obviously enough suggested by the physical features of the peninsula. Alike in a political and in a military point of view Rome was justified in shifting its northern boundary from the low and easily crossed Apennines to the mighty mountain-wall that separates northern from southern Europe, the Alps, and in combining with the sovereignty of Italy the sovereignty of the seas and islands on the west and east of the peninsula; and now, when by the expulsion of the Phoenicians from Sicily the most difficult portion of the task had been already achieved, various circumstances united to facilitate its completion by the Roman government.

Sicily a Dependency of Italy

In the western sea which was of far more account for Italy than the Adriatic, the most important position, the large and fertile island of Sicily copiously furnished with harbours, had been by the peace with Carthage transferred for the most part into the possession of the Romans. King Hiero of Syracuse indeed, who during the last twenty-two years of the war had adhered with unshaken steadfastness to the Roman alliance, might have had a fair claim to an extension of territory; but, if Roman policy had begun the war with the resolution of tolerating only secondary states in the island, the views of the Romans at its close decidedly tended towards the seizure of Sicily for themselves. Hiero might be content that his territory—namely, in addition to the immediate district of Syracuse,

Page 488

the domains of Elorus, Neetum, Acrae, Leontini, Megara, and Tauromenium—and his independence in relation to foreign powers, were (for want of any pretext to curtail them) left to him in their former compass; he might well be content that the war between the two great powers had not ended in the complete overthrow of the one or of the other, and that there consequently still remained at least a possibility of subsistence for the intermediate power in Sicily. In the remaining and by far the larger portion of Sicily, at Panormus, Lilybaeum, Agrigentum, Messana, the Romans effected a permanent settlement.

Sardinia Roman
The Libyan Insurrection
Corsica

They only regretted that the possession of that beautiful island was not enough to convert the western waters into a Roman inland sea, so long as Sardinia still remained Carthaginian. Soon, however, after the conclusion of the peace there appeared an unexpected prospect of wresting from the Carthaginians this second island of the Mediterranean. In Africa, immediately after peace had been concluded with Rome, the mercenaries and the subjects of the Phoenicians joined in a common revolt. The blame of the dangerous insurrection was mainly chargeable on the Carthaginian government. In the last years of the war Hamilcar had not been able to pay his Sicilian mercenaries as formerly from his own resources, and he had vainly requested that money might be sent to him from home; he might, he was told, send his forces to Africa to be paid off. He obeyed; but as he knew the men, he prudently embarked them in small subdivisions, that the authorities might pay them off by troops or might at least separate them, and thereupon he laid down his command. But all his precautions were thwarted not so much by the emptiness of the exchequer, as by the collegiate method of transacting business and the folly of the bureaucracy. They waited till the whole army was once more united in Libya, and then endeavoured to curtail the pay promised to the men. Of course a mutiny broke out among the troops, and the hesitating and cowardly demeanour of the authorities showed the mutineers what they might dare. Most of them were natives of the districts ruled by, or dependent on, Carthage; they knew the feelings which had been provoked throughout these districts by the slaughter decreed by the government after the expedition of Regulus(1) and by the fearful pressure of taxation, and they knew also the character of their government, which never kept faith and never pardoned; they were well aware of what awaited them, should they disperse to their homes with pay exacted by mutiny. The Carthaginians had for long been digging the mine, and they now themselves supplied the men who could not but explode it. Like wildfire the revolution spread from garrison to garrison, from village to village; the Libyan women contributed their ornaments to pay the wages of the mercenaries; a number of Carthaginian citizens, amongst whom were some of the most distinguished officers of the Sicilian army, became the victims of the infuriated multitude; Carthage was already

besieged on two sides, and the Carthaginian army marching out of the city was totally routed in consequence of the blundering of its unskilful leader.

Page 489

When the Romans thus saw their hated and still dreaded foe involved in a greater danger than any ever brought on that foe by the Roman wars, they began more and more to regret the conclusion of the peace of 513—which, if it was not in reality precipitate, now at least appeared so to all—and to forget how exhausted at that time their own state had been and how powerful had then been the standing of their Carthaginian rival. Shame indeed forbade their entering into communication openly with the Carthaginian rebels; in fact, they gave an exceptional permission to the Carthaginians to levy recruits for this war in Italy, and prohibited Italian mariners from dealing with the Libyans. But it may be doubted whether the government of Rome was very earnest in these acts of friendly alliance; for, in spite of them, the dealings between the African insurgents and the Roman mariners continued, and when Hamilcar, whom the extremity of the peril had recalled to the command of the Carthaginian army, seized and imprisoned a number of Italian captains concerned in these dealings, the senate interceded for them with the Carthaginian government and procured their release. The insurgents themselves appeared to recognize in the Romans their natural allies. The garrisons in Sardinia, which like the rest of the Carthaginian army had declared in favour of the insurgents, offered the possession of the island to the Romans, when they saw that they were unable to hold it against the attacks of the un-conquered mountaineers of the interior (about 515); and similar offers came even from the community of Utica, which had likewise taken part in the revolt and was now hard pressed by the arms of Hamilcar. The latter suggestion was declined by the Romans, chiefly doubtless because its acceptance would have carried them beyond the natural boundaries of Italy and therefore farther than the Roman government was then disposed to go; on the other hand they entertained the offers of the Sardinian mutineers, and took over from them the portion of Sardinia which had been in the hands of the Carthaginians (516). In this instance, even more than in the affair of the Mamertines, the Romans were justly liable to the reproach that the great and victorious burgesses had not disdained to fraternize and share the spoil with a venal pack of mercenaries, and had not sufficient self-denial to prefer the course enjoined by justice and by honour to the gain of the moment. The Carthaginians, whose troubles reached their height just about the period of the occupation of Sardinia, were silent for the time being as to the unwarrantable violence; but, after this peril had been, contrary to the expectations and probably contrary to the hopes of the Romans, averted by the genius of Hamilcar, and Carthage had been reinstated to her full sovereignty in Africa (517), Carthaginian envoys immediately appeared at Rome to require the restitution of Sardinia. But the Romans, not inclined to restore their booty, replied with frivolous

Page 490

or at any rate irrelevant complaints as to all sorts of injuries which they alleged that the Carthaginians had inflicted on the Roman traders, and hastened to declare war;(2) the principle, that in politics power is the measure of right, appeared in its naked effrontery. Just resentment urged the Carthaginians to accept that offer of war; had Catulus insisted upon the cession of Sardinia five years before, the war would probably have pursued its course. But now, when both islands were lost, when Libya was in a ferment, and when the state was weakened to the utmost by its twenty-four years' struggle with Rome and the dreadful civil war that had raged for nearly five years more, they were obliged to submit. It was only after repeated entreaties, and after the Phoenicians had bound themselves to pay to Rome a compensation of 1200 talents (292,000 pounds) for the warlike preparations which had been wantonly occasioned, that the Romans reluctantly desisted from war. Thus the Romans acquired Sardinia almost without a struggle; to which they added Corsica, the ancient possession of the Etruscans, where perhaps some detached Roman garrisons still remained over from the last war.(3) In Sardinia, however, and still more in the rugged Corsica, the Romans restricted themselves, just as the Phoenicians had done, to an occupation of the coasts. With the natives in the interior they were continually engaged in war or, to speak more correctly, in hunting them like wild beasts; they baited them with dogs, and carried what they captured to the slave market; but they undertook no real conquest. They had occupied the islands not on their own account, but for the security of Italy. Now that the confederacy possessed the three large islands, it might call the Tyrrhene Sea its own.

Method of Administration in the Transmarine Possessions Provincial Praetors

The acquisition of the islands in the western sea of Italy introduced into the state administration of Rome a distinction, which to all appearance originated in mere considerations of convenience and almost accidentally, but nevertheless came to be of the deepest importance for all time following—the distinction between the continental and transmarine forms of administration, or to use the appellations afterwards current, the distinction between Italy and the provinces. Hitherto the two chief magistrates of the community, the consuls, had not had any legally defined sphere of action; on the contrary their official field extended as far as the Roman government itself. Of course, however, in practice they made a division of functions between them, and of course also they were bound in every particular department of their duties by the enactments existing in regard to it; the jurisdiction, for instance, over Roman citizens had in every case to be left to the praetor, and in the Latin and other autonomous communities the existing treaties had to be respected. The four quaestors who had been

Page 491

since 487 distributed throughout Italy did not, formally at least, restrict the consular authority, for in Italy, just as in Rome, they were regarded simply as auxiliary magistrates dependent on the consuls. This mode of administration appears to have been at first extended also to the territories taken from Carthage, and Sicily and Sardinia to have been governed for some years by quaestors under the superintendence of the consuls; but the Romans must very soon have become practically convinced that it was indispensable to have superior magistrates specially appointed for the transmarine regions. As they had been obliged to abandon the concentration of the Roman jurisdiction in the person of the praetor as the community became enlarged, and to send to the more remote districts deputy judges,(4) so now (527) the concentration of administrative and military power in the person of the consuls had to be abandoned. For each of the new transmarine regions—viz. Sicily, and Sardinia with Corsica annexed to it—there was appointed a special auxiliary consul, who was in rank and title inferior to the consul and equal to the praetor, but otherwise was—like the consul in earlier times before the praetorship was instituted—in his own sphere of action at once commander-in-chief, chief magistrate, and supreme judge. The direct administration of finance alone was withheld from these new chief magistrates, as from the first it had been withheld from the consuls;(5) one or more quaestors were assigned to them, who were in every way indeed subordinate to them, and were their assistants in the administration of justice and in command, but yet had specially to manage the finances and to render account of their administration to the senate after having laid down their office.

Organization of the Provinces

-Commercium-

Property

Autonomy

This difference in the supreme administrative power was the essential distinction between the transmarine and continental possessions. The principles on which Rome had organized the dependent lands in Italy, were in great part transferred also to the extra-Italian possessions. As a matter of course, these communities without exception lost independence in their external relations. As to internal intercourse, no provincial could thenceforth acquire valid property in the province out of the bounds of his own community, or perhaps even conclude a valid marriage. On the other hand the Roman government allowed, at least to the Sicilian towns which they had not to fear, a certain federative organization, and probably even general Siceliot diets with a harmless right of petition and complaint.(6) In monetary arrangements it was not indeed practicable at once to declare the Roman currency to be the only valid tender in the islands; but it seems from the first to have obtained legal circulation, and in like manner, at least as a rule, the right of coining in precious metals seems to have been withdrawn from the cities in Roman Sicily.(7)

Page 492

On the other hand not only was the landed property in all Sicily left untouched—the principle, that the land out of Italy fell by right of war to the Romans as private property, was still unknown to this century—but all the Sicilian and Sardinian communities retained self-administration and some sort of autonomy, which indeed was not assured to them in a way legally binding, but was provisionally allowed. If the democratic constitutions of the communities were everywhere set aside, and in every city the power was transferred to the hands of a council representing the civic aristocracy; and if moreover the Sicilian communities, at least, were required to institute a general valuation corresponding to the Roman census every fifth year; both these measures were only the necessary sequel of subordination to the Roman senate, which in reality could not govern with Greek —*ecclesiae*—, or without a view of the financial and military resources of each dependent community; in the various districts of Italy also the same course was in both respects pursued.

Tenths and Customs Communities Exempted

But, side by side with this essential equality of rights, there was established a distinction, very important in its effects, between the Italian communities on the one hand and the transmarine communities on the other. While the treaties concluded with the Italian towns imposed on them a fixed contingent for the army or the fleet of the Romans, such a contingent was not imposed on the transmarine communities, with which no binding paction was entered into at all, but they lost the right of arms,(8) with the single exception that they might be employed on the summons of the Roman praetor for the defence of their own homes. The Roman government regularly sent Italian troops, of the strength which it had fixed, to the islands; in return for this, a tenth of the field-produce of Sicily, and a toll of 5 per cent on the value of all articles of commerce exported from or imported into the Sicilian harbours, were paid to Rome. To the islanders these taxes were nothing new. The imposts levied by the Persian great-king and the Carthaginian republic were substantially of the same character with that tenth; and in Greece also such a taxation had for long been, after Oriental precedent, associated with the -tyrannis- and often also with a hegemony. The Sicilians had in this way long paid their tenth either to Syracuse or to Carthage, and had been wont to levy customs-dues no longer on their own account. “We received,” says Cicero, “the Sicilian communities into our clientship and protection in such a way that they continued under the same law under which they had lived before, and obeyed the Roman community under relations similar to those in which they had obeyed their own rulers.” It is fair that this should not be forgotten; but to continue an injustice is to commit injustice. Viewed in relation not to the subjects, who merely changed masters, but to

Page 493

their new rulers, the abandonment of the equally wise and magnanimous principle of Roman statesmanship—viz., that Rome should accept from her subjects simply military aid, and never pecuniary compensation in lieu of it—was of a fatal importance, in comparison with which all alleviations in the rates and the mode of levying them, as well as all exceptions in detail, were as nothing. Such exceptions were, no doubt, made in various cases. Messina was directly admitted to the confederacy of the -togati-, and, like the Greek cities in Italy, furnished its contingent to the Roman fleet. A number of other cities, while not admitted to the Italian military confederacy, yet received in addition to other favours immunity from tribute and tenths, so that their position in a financial point of view was even more favourable than that of the Italian communities. These were Segesta and Halicyae, which were the first towns of Carthaginian Sicily that joined the Roman alliance; Centuripa, an inland town in the east of the island, which was destined to keep a watch over the Syracusan territory in its neighbourhood;(9) Halaesa on the northern coast, which was the first of the free Greek towns to join the Romans, and above all Panormus, hitherto the capital of Carthaginian, and now destined to become that of Roman, Sicily. The Romans thus applied to Sicily the ancient principle of their policy, that of subdividing the dependent communities into carefully graduated classes with different privileges; but, on the average, the Sardinian and Sicilian communities were not in the position of allies but in the manifest relation of tributary subjection.

Italy and the Provinces

It is true that this thorough distinction between the communities that furnished contingents and those that paid tribute, or at least did not furnish contingents, was not in law necessarily coincident with the distinction between Italy and the provinces. Transmarine communities might belong to the Italian confederacy; the Mamertines for example were substantially on a level with the Italian Sabellians, and there existed no legal obstacle to the establishment even of new communities with Latin rights in Sicily and Sardinia any more than in the country beyond the Apennines. Communities on the mainland might be deprived of the right of bearing arms and become tributary; this arrangement was already the case with certain Celtic districts on the Po, and was introduced to a considerable extent in after times. But, in reality, the communities that furnished contingents just as decidedly preponderated on the mainland as the tributary communities in the islands; and while Italian settlements were not contemplated on the part of the Romans either in Sicily with its Hellenic civilization or in Sardinia, the Roman government had beyond doubt already determined not only to subdue the barbarian land between the Apennines and the Alps, but also, as their conquests advanced, to establish in it new communities of Italic origin

Page 494

and Italic rights. Thus their transmarine possessions were not merely placed on the footing of land held by subjects, but were destined to remain on that footing in all time to come; whereas the official field recently marked off by law for the consuls, or, which is the same thing, the continental territory of the Romans, was to become a new and more extended Italy, which should reach from the Alps to the Ionian sea. In the first instance, indeed, this essentially geographical conception of Italy was not altogether coincident with the political conception of the Italian confederacy; it was partly wider, partly narrower. But even now the Romans regarded the whole space up to the boundary of the Alps as -Italia-, that is, as the present or future domain of the -togati-and, just as was and still is the case in North America, the boundary was provisionally marked off in a geographical sense, that the field might be gradually occupied in a political sense also with the advance of colonization.(10)

Events on the Adriatic Coasts

In the Adriatic sea, at the entrance of which the important and long-contemplated colony of Brundisium had at length been founded before the close of the war with Carthage (510), the supremacy of Rome was from the very first decided. In the western sea Rome had been obliged to rid herself of rivals; in the eastern, the quarrels of the Hellenes themselves prevented any of the states in the Grecian peninsula from acquiring or retaining power. The most considerable of them, that of Macedonia, had through the influence of Egypt been dislodged from the upper Adriatic by the Aetolians and from the Peloponnesus by the Achaeans, and was scarcely even in a position to defend its northern frontier against the barbarians. How concerned the Romans were to keep down Macedonia and its natural ally, the king of Syria, and how closely they associated themselves with the Egyptian policy directed to that object, is shown by the remarkable offer which after the end of the war with Carthage they made to king Ptolemy *iii.* Euergetes, to support him in the war which he waged with Seleucus *ii.* Callinicus of Syria (who reigned 507-529) on account of the murder of Berenice, and in which Macedonia had probably taken part with the latter. Generally, the relations of Rome with the Hellenistic states became closer; the senate already negotiated even with Syria, and interceded with the Seleucus just mentioned on behalf of the Ilrians with whom the Romans claimed affinity.

For a direct interference of the Romans in the affairs of the eastern powers there was no immediate need. The Achaean league, the prosperity of which was arrested by the narrow-minded coterie-policy of Aratus, the Aetolian republic of military adventurers, and the decayed Macedonian empire kept each other in check; and the Romans of that time avoided rather than sought transmarine acquisitions. When the Acarnanians, appealing to the ground that they alone of all the

Page 495

Greeks had taken no part in the destruction of Ilion, besought the descendants of Aeneas to help them against the Aetolians, the senate did indeed attempt a diplomatic mediation; but when the Aetolians returned an answer drawn up in their own saucy fashion, the antiquarian interest of the Roman senators by no means provoked them into undertaking a war by which they would have freed the Macedonians from their hereditary foe (about 515).

Illyrian Piracy Expedition against Scodra

Even the evil of piracy, which was naturally in such a state of matters the only trade that flourished on the Adriatic coast, and from which the commerce of Italy suffered greatly, was submitted to by the Romans with an undue measure of patience, —a patience intimately connected with their radical aversion to maritime war and their wretched marine. But at length it became too flagrant. Favoured by Macedonia, which no longer found occasion to continue its old function of protecting Hellenic commerce from the corsairs of the Adriatic for the benefit of its foes, the rulers of Scodra had induced the Illyrian tribes—nearly corresponding to the Dalmatians, Montenegrins, and northern Albanians of the present day—to unite for joint piratical expeditions on a great scale.

With whole squadrons of their swift-sailing biremes, the veil-known “Liburnian” cutters, the Illyrians waged war by sea and along the coasts against all and sundry. The Greek settlements in these regions, the island-towns of Issa (Lissa) and Pharos (Lesina), the important ports of Epidamnus (Durazzo) and Apollonia (to the north of Avlona on the Aous) of course suffered especially, and were repeatedly beleaguered by the barbarians. Farther to the south, moreover, the corsairs established themselves in Phoenice, the most flourishing town of Epirus; partly voluntarily, partly by constraint, the Epirots and Acarnanians entered into an unnatural symmachy with the foreign freebooters; the coast was insecure even as far as Elis and Messene. In vain the Aetolians and Achaeans collected what ships they had, with a view to check the evil: in a battle on the open sea they were beaten by the pirates and their Greek allies; the corsair fleet was able at length to take possession even of the rich and important island of Corcyra (Corfu). The complaints of Italian mariners, the appeals for aid of their old allies the Apolloniates, and the urgent entreaties of the besieged Issaeans at length compelled the Roman senate to send at least ambassadors to Scodra. The brothers Gaius and Lucius Coruncanius went thither to demand that king Agron should put an end to the disorder. The king answered that according to the national law of the Illyrians piracy was a lawful trade, and that the government had no right to put a stop to privateering; whereupon Lucius Coruncanius replied, that in that case Rome would make it her business to introduce a better law among the Illyrians. For this certainly not very diplomatic reply one

Page 496

of the envoys was—by the king's orders, as the Romans asserted—murdered on the way home, and the surrender of the murderers was refused. The senate had now no choice left to it. In the spring of 525 a fleet of 200 ships of the line, with a landing-army on board, appeared off Apollonia; the corsair-vessels were scattered before the former, while the latter demolished the piratic strongholds; the queen Teuta, who after the death of her husband Agron conducted the government during the minority of her son Pinnes, besieged in her last retreat, was obliged to accept the conditions dictated by Rome. The rulers of Scodra were again confined both on the north and south to the narrow limits of their original domain, and had to quit their hold not only on all the Greek towns, but also on the Ardiaei in Dalmatia, the Parthini around Epidamnus, and the Atintanes in northern Epirus; no Illyrian vessel of war at all, and not more than two unarmed vessels in company, were to be allowed in future to sail to the south of Lissus (Alessio, between Scutari and Durazzo). The maritime supremacy of Rome in the Adriatic was asserted, in the most praiseworthy and durable way, by the rapid and energetic suppression of the evil of piracy.

Acquisition of Territory in Illyria Impression in Greece and Macedonia

But the Romans went further, and established themselves on the east coast. The Illyrians of Scodra were rendered tributary to Rome; Demetrius of Pharos, who had passed over from the service of Teuta to that of the Romans, was installed, as a dependent dynast and ally of Rome, over the islands and coasts of Dalmatia; the Greek cities Corcyra, Epidamnus, Apollonia, and the communities of the Atintanes and Parthini were attached to Rome under mild forms of symmarchy. These acquisitions on the east coast of the Adriatic were not sufficiently extensive to require the appointment of a special auxiliary consul; governors of subordinate rank appear to have been sent to Corcyra and perhaps also to other places, and the superintendence of these possessions seems to have been entrusted to the chief magistrates who administered Italy.⁽¹¹⁾ Thus the most important maritime stations in the Adriatic became subject, like Sicily and Sardinia, to the authority of Rome. What other result was to be expected? Rome was in want of a good naval station in the upper Adriatic—a want which was not supplied by her possessions on the Italian shore; her new allies, especially the Greek commercial towns, saw in the Romans their deliverers, and doubtless did what they could permanently to secure so powerful a protection; in Greece itself no one was in a position to oppose the movement; on the contrary, the praise of the liberators was on every one's lips. It may be a question whether there was greater rejoicing or shame in Hellas, when, in place of the ten ships of the line of the Achaean league, the most warlike power in Greece, two hundred sail belonging to the barbarians now entered

Page 497

her harbours and accomplished at a blow the task, which properly belonged to the Greeks, but in which they had failed so miserably. But if the Greeks were ashamed that the salvation of their oppressed countrymen had to come from abroad, they accepted the deliverance at least with a good grace; they did not fail to receive the Romans solemnly into the fellowship of the Hellenic nation by admitting them to the Isthmian games and the Eleusinian mysteries.

Macedonia was silent; it was not in a condition to protest in arms, and disdained to do so in words. No resistance was encountered. Nevertheless Rome, by seizing the keys to her neighbour's house, had converted that neighbour into an adversary who, should he recover his power, or should a favourable opportunity occur, might be expected to know how to break the silence. Had the energetic and prudent king Antigonus Doson lived longer, he would have doubtless taken up the gauntlet which the Romans had flung down, for, when some years afterwards the dynast Demetrius of Pharos withdrew from the hegemony of Rome, prosecuted piracy contrary to the treaty in concert with the Istrians, and subdued the Atintanes whom the Romans had declared independent, Antigonus formed an alliance with him, and the troops of Demetrius fought along with the army of Antigonus at the battle of Sellasia (532). But Antigonus died (in the winter 533-4); and his successor Philip, still a boy, allowed the Consul Lucius Aemilius Paullus to attack the ally of Macedonia, to destroy his capital, and to drive him from his kingdom into exile (535).

Northern Italy

The mainland of Italy proper, south of the Apennines, enjoyed profound peace after the fall of Tarentum: the six days' war with Falerii (513) was little more than an interlude. But towards the north, between the territory of the confederacy and the natural boundary of Italy—the chain of the Alps—there still extended a wide region which was not subject to the Romans. What was regarded as the boundary of Italy on the Adriatic coast was the river Aesis immediately above Ancona. Beyond this boundary the adjacent properly Gallic territory as far as, and including, Ravenna belonged in a similar way as did Italy proper to the Roman alliance; the Senones, who had formerly settled there, were extirpated in the war of 471-2,(12) and the several townships were connected with Rome, either as burgess-colonies, like Sena Gallica,(13) or as allied towns, whether with Latin rights, like Ariminum,(14) or with Italian rights, like Ravenna. On the wide region beyond Ravenna as far as the Alps non-Italian peoples were settled. South of the Po the strong Celtic tribe of the Boii still held its ground (from Parma to Bologna); alongside of them, the Lingones on the east and the Anares on the west (in the region of Parma)—two smaller Celtic cantons presumably clients of the Boii—peopled the plain. At the western end of the plain the Ligurians began, who, mingled with isolated

Page 498

Celtic tribes, and settled on the Apennines from above Arezzo and Pisa westward, occupied the region of the sources of the Po. The eastern portion of the plain north of the Po, nearly from Verona to the coast, was possessed by the Veneti, a race different from the Celts and probably of Illyrian extraction. Between these and the western mountains were settled the Cenomani (about Brescia and Cremona) who rarely acted with the Celtic nation and were probably largely intermingled with Veneti, and the Insubres (around Milan). The latter was the most considerable of the Celtic cantons in Italy, and was in constant communication not merely with the minor communities partly of Celtic, partly of non-Celtic extraction, that were scattered in the Alpine valleys, but also with the Celtic cantons beyond the Alps. The gates of the Alps, the mighty stream navigable for 230 miles, and the largest and most fertile plain of the then civilized Europe, still continued in the hands of the hereditary foes of the Italian name, who, humbled indeed and weakened, but still scarce even nominally dependent and still troublesome neighbours, persevered in their barbarism, and, thinly scattered over the spacious plains, continued to pasture their herds and to plunder. It was to be anticipated that the Romans would hasten to possess themselves of these regions; the more so as the Celts gradually began to forget their defeats in the campaigns of 471 and 472 and to bestir themselves again, and, what was still more dangerous, the Transalpine Celts began anew to show themselves on the south of the Alps.

Celtic Wars

In fact the Boii had already renewed the war in 516, and their chiefs Atis and Galatas had—without, it is true, the authority of the general diet—summoned the Transalpine Gauls to make common cause with them. The latter had numerously answered the call, and in 518 a Celtic army, such as Italy had not seen for long, encamped before Ariminum. The Romans, for the moment much too weak to attempt a battle, concluded an armistice, and to gain time allowed envoys from the Celts to proceed to Rome, who ventured in the senate to demand the cession of Ariminum—it seemed as if the times of Brennus had returned. But an unexpected incident put an end to the war before it had well begun. The Boii, dissatisfied with their unbidden allies and afraid probably for their own territory, fell into variance with the Transalpine Gauls. An open battle took place between the two Celtic hosts; and, after the chiefs of the Boii had been put to death by their own men, the Transalpine Gauls returned home. The Boii were thus delivered into the hands of the Romans, and the latter were at liberty to expel them like the Senones, and to advance at least to the Po; but they preferred to grant the Boii peace in return for the cession of some districts of their land (518). This was probably done, because they were just at that time expecting the renewed outbreak of war with Carthage; but, after that war

Page 499

had been averted by the cession of Sardinia, true policy required the Roman government to take possession as speedily and entirely as possible of the country up to the Alps. The constant apprehensions on the part of the Celts as to such a Roman invasion were therefore sufficiently justified; but the Romans were in no haste. So the Celts on their part began the war, either because the Roman assignments of land on the east coast (522), although not a measure immediately directed against them, made them apprehensive of danger; or because they perceived that a war with Rome for the possession of Lombardy was inevitable; or, as is perhaps most probable, because their Celtic impatience was once more weary of inaction and preferred to arm for a new warlike expedition. With the exception of the Cenomani, who acted with the Veneti and declared for the Romans, all the Italian Celts concurred in the war, and they were joined by the Celts of the upper valley of the Rhone, or rather by a number of adventurers belonging to them, under the leaders Concolitanus and Aneroestus.(15) With 50,000 warriors on foot, and 20,000 on horseback or in chariots, the leaders of the Celts advanced to the Apennines (529). The Romans had not anticipated an attack on this side, and had not expected that the Celts, disregarding the Roman fortresses on the east coast and the protection of their own kinsmen, would venture to advance directly against the capital. Not very long before a similar Celtic swarm had in an exactly similar way overrun Greece. The danger was serious, and appeared still more serious than it really was. The belief that Rome's destruction was this time inevitable, and that the Roman soil was fated to become the property of the Gauls, was so generally diffused among the multitude in Rome itself that the government reckoned it not beneath its dignity to allay the absurd superstitious belief of the mob by an act still more absurd, and to bury alive a Gaulish man and a Gaulish woman in the Roman Forum with a view to fulfil the oracle of destiny. At the same time they made more serious preparations. Of the two consular armies, each of which numbered about 25,000 infantry and 1100 cavalry, one was stationed in Sardinia under Gaius Atilius Regulus, the other at Ariminum under Lucius Aemilius Papus. Both received orders to repair as speedily as possible to Etruria, which was most immediately threatened. The Celts had already been under the necessity of leaving a garrison at home to face the Cenomani and Veneti, who were allied with Rome; now the levy of the Umbrians was directed to advance from their native mountains down into the plain of the Boii, and to inflict all the injury which they could think of on the enemy upon his own soil. The militia of the Etruscans and Sabines was to occupy the Apennines and if possible to obstruct the passage, till the regular troops could arrive. A reserve was formed in Rome of 50,000 men. Throughout all Italy, which on this occasion recognized its true champion in Rome, the men capable of service were enrolled, and stores and materials of war were collected.

Page 500

Battle of Telamon

All this, however, required time. For once the Romans had allowed themselves to be surprised, and it was too late at least to save Etruria. The Celts found the Apennines hardly defended, and plundered unopposed the rich plains of the Tuscan territory, which for long had seen no enemy. They were already at Clusium, three days' march from Rome, when the army of Ariminum, under the consul Papus, appeared on their flank, while the Etruscan militia, which after crossing the Apennines had assembled in rear of the Gauls, followed the line of the enemy's march. Suddenly one evening, after the two armies had already encamped and the bivouac fires were kindled, the Celtic infantry again broke up and retreated on the road towards Faesulae (Fiesole): the cavalry occupied the advanced posts during the night, and followed the main force next morning. When the Tuscan militia, who had pitched their camp close upon the enemy, became aware of his departure, they imagined that the host had begun to disperse, and marched hastily in pursuit. The Gauls had reckoned on this very result: their infantry, which had rested and was drawn up in order, awaited on a well-chosen battlefield the Roman militia, which came up from its forced march fatigued and disordered. Six thousand men fell after a furious combat, and the rest of the militia, which had been compelled to seek refuge on a hill, would have perished, had not the consular army appeared just in time. This induced the Gauls to return homeward. Their dexterously-contrived plan for preventing the union of the two Roman armies and annihilating the weaker in detail, had only been partially successful; now it seemed to them advisable first of all to place in security their considerable booty. For the sake of an easier line of march they proceeded from the district of Chiusi, where they were, to the level coast, and were marching along the shore, when they found an unexpected obstacle in the way. It was the Sardinian legions, which had landed at Pisae; and, when they arrived too late to obstruct the passage of the Apennines, had immediately put themselves in motion and were advancing along the coast in a direction opposite to the march of the Gauls. Near Telamon (at the mouth of the Ombrone) they met with the enemy. While the Roman infantry advanced with close front along the great road, the cavalry, led by the consul Gaius Atilius Regulus in person, made a side movement so as to take the Gauls in flank, and to acquaint the other Roman army under Papus as soon as possible with their arrival. A hot cavalry engagement took place, in which along with many brave Romans Regulus fell; but he had not sacrificed his life in vain: his object was gained. Papus became aware of the conflict, and guessed how matters stood; he hastily arrayed his legions, and on both sides the Celtic host was now pressed by Roman legions. Courageously it made its dispositions for the double

Page 501

conflict, the Transalpine Gauls and Insubres against the troops of Papus, the Alpine Taurisci and the Boii against the Sardinian infantry; the cavalry combat pursued its course apart on the flank. The forces were in numbers not unequally matched, and the desperate position of the Gauls impelled them to the most obstinate resistance. But the Transalpine Gauls, accustomed only to close fighting, gave way before the missiles of the Roman skirmishers; in the hand-to-hand combat the better temper of the Roman weapons placed the Gauls at a disadvantage; and at last an attack in flank by the victorious Roman cavalry decided the day. The Celtic horsemen made their escape; the infantry, wedged in between the sea and the three Roman armies, had no means of flight. 10,000 Celts, with their king Concolitanus, were taken prisoners; 40,000 others lay dead on the field of battle; Anerostus and his attendants had, after the Celtic fashion, put themselves to death.

The Celts Attacked in Their Own Land

The victory was complete, and the Romans were firmly resolved to prevent the recurrence of such surprises by the complete subjugation of the Celts on the south of the Alps. In the following year (530) the Boii submitted without resistance along with the Lingones; and in the year after that (531) the Anares; so that the plain as far as the Po was in the hands of the Romans. The conquest of the northern bank of the river cost a more serious struggle. Gaius Flaminius crossed the river in the newly-acquired territory of the Anares (somewhere near Piacenza) in 531; but during the crossing, and still more while making good his footing on the other bank, he suffered so heavy losses and found himself with the river in his rear in so dangerous a position, that he made a capitulation with the enemy to secure a free retreat, which the Insubres foolishly conceded. Scarce, however, had he escaped when he appeared in the territory of the Cenomani, and, united with them, advanced for the second time from the north into the canton of the Insubres. The Gauls perceived what was now the object of the Romans, when it was too late: they took from the temple of their goddess the golden standards called the "immovable," and with their whole levy, 50,000 strong, they offered battle to the Romans. The situation of the latter was critical: they were stationed with their back to a river (perhaps the Oglio), separated from home by the enemy's territory, and left to depend for aid in battle as well as for their line of retreat on the uncertain friendship of the Cenomani. There was, however, no choice. The Gauls fighting in the Roman ranks were placed on the left bank of the stream; on the right, opposite to the Insubres, the legions were drawn up, and the bridges were broken down that they might not be assailed, at least in the rear, by their dubious allies.

The Celts Conquered by Rome

Page 502

In this way undoubtedly the river cut off their retreat, and their way homeward lay through the hostile army. But the superiority of the Roman arms and of Roman discipline achieved the victory, and the army cut its way through: once more the Roman tactics had redeemed the blunders of the general. The victory was due to the soldiers and officers, not to the generals, who gained a triumph only through popular favour in opposition to the just decree of the senate. Gladly would the Insubres have made peace; but Rome required unconditional subjection, and things had not yet come to that pass. They tried to maintain their ground with the help of their northern kinsmen; and, with 30,000 mercenaries whom they had raised amongst these and their own levy, they received the two consular armies advancing once more in the following year (532) from the territory of the Cenomani to invade their land. Various obstinate combats took place; in a diversion, attempted by the Insubres against the Roman fortress of Clastidium (Casteggio, below Pavia), on the right bank of the Po, the Gallic king Viridomar fell by the hand of the consul Marcus Marcellus. But, after a battle already half won by the Celts but ultimately decided in favour of the Romans, the consul Gnaeus Scipio took by assault Mediolanum, the capital of the Insubres, and the capture of that town and of Comum terminated their resistance. Thus the Celts of Italy were completely vanquished, and as, just before, the Romans had shown to the Hellenes in the war with the pirates the difference between a Roman and a Greek sovereignty of the seas, so they had now brilliantly demonstrated that Rome knew how to defend the gates of Italy against freebooters on land otherwise than Macedonia had guarded the gates of Greece, and that in spite of all internal quarrels Italy presented as united a front to the national foe, as Greece exhibited distraction and discord.

Romanization of the Entire of Italy

The boundary of the Alps was reached, in so far as the whole flat country on the Po was either rendered subject to the Romans, or, like the territories of the Cenomani and Veneti, was occupied by dependent allies. It needed time, however, to reap the consequences of this victory and to Romanize the land. In this the Romans did not adopt a uniform mode of procedure. In the mountainous northwest of Italy and in the more remote districts between the Alps and the Po they tolerated, on the whole, the former inhabitants; the numerous wars, as they are called, which were waged with the Ligurians in particular (first in 516) appear to have been slave-hunts rather than wars, and, often as the cantons and valleys submitted to the Romans, Roman sovereignty in that quarter was hardly more than a name. The expedition to Istria also (533) appears not to have aimed at much more than the destruction of the last lurking-places of the Adriatic pirates, and the establishment of a communication by land along

Page 503

the coast between the Italian conquests of Rome and her acquisitions on the other shore. On the other hand the Celts in the districts south of the Po were doomed irretrievably to destruction; for, owing to the looseness of the ties connecting the Celtic nation, none of the northern Celtic cantons took part with their Italian kinsmen except for money, and the Romans looked on the latter not only as their national foes, but as the usurpers of their natural heritage. The extensive assignments of land in 522 had already filled the whole territory between Ancona and Ariminum with Roman colonists, who settled here without communal organization in market-villages and hamlets. Further measures of the same character were taken, and it was not difficult to dislodge and extirpate a half-barbarous population like the Celtic, only partially following agriculture, and destitute of walled towns. The great northern highway, which had been, probably some eighty years earlier, carried by way of Otricoli to Narni, and had shortly before been prolonged to the newly-founded fortress of Spoletium (514), was now (534) carried, under the name of the “Flaminian” road, by way of the newly-established market-village Forum Flaminii (near Foligno), through the pass of Furlo to the coast, and thence along the latter from Fanum (Fano) to Ariminum; it was the first artificial road which crossed the Apennines and connected the two Italian seas. Great zeal was manifested in covering the newly-acquired fertile territory with Roman townships. Already, to cover the passage of the Po, the strong fortress of Placentia (Piacenza) had been founded on the right bank; not far from it Cremona had been laid out on the left bank, and the building of the walls of Mutina (Modena), in the territory taken away from the Boii, had far advanced —already preparations were being made for further assignments of land and for continuing the highway, when sudden event interrupted the Romans in reaping the fruit of their successes.

Notes for Chapter III

1. III. II. Evacuation of Africa
2. That the cession of the islands lying between Sicily and Italy, which the peace of 513 prescribed to the Carthaginians, did not include the cession of Sardinia is a settled point (*iii. II. Remarks On the Roman Conduct of the War*); but the statement, that the Romans made that a pretext for their occupation of the island three years after the peace, is ill attested. Had they done so, they would merely have added a diplomatic folly to the political effrontery.
3. III. II. The War on the Coasts of Sicily and Sardinia
4. III. VIII. Changes in Procedure
5. II. I. Restrictions on the Delegation of Powers

6. That this was the case may be gathered partly from the appearance of the “Siculi” against Marcellus (Liv. xxvi. 26, seq.), partly from the “conjoint petitions of all the Sicilian communities” (Cicero, Verr. ii. 42, 102; 45, 114; 50, 146; iii. 88, 204), partly from well-known analogies (Marquardt, Handb. iii. i, 267). Because there was no -commercium- between the different towns, it by no means follows that there was no -concilium-.

Page 504

7. The right of coining gold and silver was not monopolized by Rome in the provinces so strictly as in Italy, evidently because gold and silver money not struck after the Roman standard was of less importance. But in their case too the mints were doubtless, as a rule, restricted to the coinage of copper, or at most silver, small money; even the most favourably treated communities of Roman Sicily, such as the Mamertines, the Centuripans, the Halaesines, the Segestans, and also in the main the Pacormitaues coined only copper.

8. This is implied in Hiero's expression (Liv. xxii. 37): that he knew that the Romans made use of none but Roman or Latin infantry and cavalry, and employed "foreigners" at most only among the light-armed troops.

9. This is shown at once by a glance at the map, and also by the remarkable exceptional provision which allowed the Centuripans to buy to any part of Sicily. They needed, as Roman spies, the utmost freedom of movement. We may add that Centuripa appears to have been among the first cities that went over to Rome (Diodorus, I. xxiii. p. 501).

10. This distinction between Italy as the Roman mainland or consular sphere on the one hand, and the transmarine territory or praetorial sphere on the other, already appears variously applied in the sixth century. The ritual rule, that certain priests should not leave Rome (Val. Max. i. i, 2), was explained to mean, that they were not allowed to cross the sea (Liv. Ep. 19, xxxvii. 51; Tac. Ann. iii. 58, 71; Cic. Phil. xi. 8, 18; comp. Liv. xxviii. 38, 44, Ep. 59). To this head still more definitely belongs the interpretation which was proposed in 544 to be put upon the old rule, that the consul might nominate the dictator only on "Roman ground": viz. that "Roman ground" comprehended all Italy (Liv. xxvii. 5). The erection of the Celtic land between the Alps and Apennines into a special province, different from that of the consuls and subject to a separate Standing chief magistrate, was the work of Sulla. Of course no one will urge as an objection to this view, that already in the sixth century Gallia or Ariminum is very often designated as the "official district" (-provincia-), usually of one of the consuls. -Provincia-, as is well known, was in the older language not—what alone it denoted subsequently—a definite space assigned as a district to a standing chief magistrate, but the department of duty fixed for the individual consul, in the first instance by agreement with his colleague, under concurrence of the senate; and in this sense frequently individual regions in northern Italy, or even North Italy generally, were assigned to individual consuls as -provincia-.

Page 505

11. A standing Roman commandant of Corcyra is apparently mentioned in Polyb. xxii. 15, 6 (erroneously translated by Liv. xxxviii. ii, comp. xlii. 37), and a similar one in the case of Issa in Liv. xliii. 9. We have, moreover, the analogy of the -praefectus pro legato insularum Baliarum- (Orelli, 732), and of the governor of Pandataria (Inscr. Reg. Neapol. 3528). It appears, accordingly, to have been a rule in the Roman administration to appoint non-senatorial -praefecti- for the more remote islands. But these “deputies” presuppose in the nature of the case a superior magistrate who nominates and superintends them; and this superior magistracy can only have been at this period that of the consuls. Subsequently, after the erection of Macedonia and Gallia Cisalpina into provinces, the superior administration was committed to one of these two governors; the very territory now in question, the nucleus of the subsequent Roman province of Illyricum, belonged, as is well known, in part to Caesar’s district of administration.

12. III. VII. The Senones Annihilated

13. III. VII. Breach between Rome and Tarentum

14. III. VII. Construction of New Fortresses and Roads

15. These, whom Polybius designates as the “Celts in the Alps and on the Rhone, who on account of their character as military adventurers are called Gaesatae (free lances),” are in the Capitoline Fasti named -Germani-. It is possible that the contemporary annalists may have here mentioned Celts alone, and that it was the historical speculation of the age of Caesar and Augustus that first induced the redactors of these Fasti to treat them as “Germans.” If, on the other hand, the mention of the Germans in the Fasti was based on contemporary records—in which case this is the earliest mention of the name—we shall here have to think not of the Germanic races who were afterwards so called, but of a Celtic horde.

CHAPTER IV

Hamilcar and Hannibal

Situation of Carthage after the Peace

The treaty with Rome in 513 gave to the Carthaginians peace, but they paid for it dearly. That the tribute of the largest portion of Sicily now flowed into the enemy’s exchequer instead of the Carthaginian treasury, was the least part of their loss. They felt a far keener regret when they not merely had to abandon the hope of monopolizing all the sea-routes between the eastern and the western Mediterranean—just as that hope seemed on the eve of fulfilment—but also saw their whole system of commercial policy broken up, the south-western basin of the Mediterranean, which they had hitherto exclusively commanded, converted since the loss of Sicily into an open thoroughfare for

all nations, and the commerce of Italy rendered completely independent of the Phoenician. Nevertheless the quiet men of Sidon might perhaps have prevailed on themselves to acquiesce in this result. They had met with

Page 506

similar blows already; they had been obliged to share with the Massiliots, the Etruscans, and the Sicilian Greeks what they had previously possessed alone; even now the possessions which they retained, Africa, Spain, and the gates of the Atlantic Ocean, were sufficient to confer power and prosperity. But in truth, where was their security that these at least would continue in their hands? The demands made by Regulus, and his very near approach to the obtaining of what he asked, could only be forgotten by those who were willing to forget; and if Rome should now renew from Lilybaeum the enterprise which she had undertaken with so great success from Italy, Carthage would undoubtedly fall, unless the perversity of the enemy or some special piece of good fortune should intervene to save it. No doubt they had peace for the present; but the ratification of that peace had hung on a thread, and they knew what public opinion in Rome thought of the terms on which it was concluded. It might be that Rome was not yet meditating the conquest of Africa and was as yet content with Italy; but if the existence of the Carthaginian state depended on that contentment, the prospect was but a sorry one; and where was the security that the Romans might not find it even convenient for their Italian policy to extirpate rather than reduce to subjection their African neighbour?

War Party and Peace Party in Carthage

In short, Carthage could only regard the peace of 513 in the light of a truce, and could not but employ it in preparations for the inevitable renewal of the war; not for the purpose of avenging the defeat which she had suffered, nor even with the primary view of recovering what she had lost, but in order to secure for herself an existence that should not be dependent on the good-will of the enemy. But when a war of annihilation is surely, though in point of time indefinitely, impending over a weaker state, the wiser, more resolute, and more devoted men—who would immediately prepare for the unavoidable struggle, accept it at a favourable moment, and thus cover their defensive policy by a strategy of offence—always find themselves hampered by the indolent and cowardly mass of the money-worshippers, of the aged and feeble, and of the thoughtless who are minded merely to gain time, to live and die in peace, and to postpone at any price the final struggle. So there was in Carthage a party for peace and a party for war, both, as was natural, associating themselves with the political distinction which already existed between the conservatives and the reformers. The former found its support in the governing boards, the council of the Ancients and that of the Hundred, led by Hanno the Great, as he was called; the latter found its support in the leaders of the multitude, particularly the much-respected Hasdrubal, and in the officers of the Sicilian army, whose great successes under the leadership of Hamilcar, although they had been otherwise fruitless, had at

Page 507

least shown to the patriots a method which seemed to promise deliverance from the great danger that beset them. Vehement feud had probably long subsisted between these parties, when the Libyan war intervened to suspend the strife. We have already related how that war arose. After the governing party had instigated the mutiny by their incapable administration which frustrated all the precautionary measures of the Sicilian officers, had converted that mutiny into a revolution by the operation of their inhuman system of government, and had at length brought the country to the verge of ruin by their military incapacity—and particularly that of their leader Hanno, who ruined the army—Hamilcar Barcas, the hero of Ercte, was in the perilous emergency solicited by the government itself to save it from the effects of its blunders and crimes. He accepted the command, and had the magnanimity not to resign it even when they appointed Hanno as his colleague. Indeed, when the indignant army sent the latter home, Hamilcar had the self-control a second time to concede to him, at the urgent request of the government, a share in the command; and, in spite of his enemies and in spite of such a colleague, he was able by his influence with the insurgents, by his dexterous treatment of the Numidian sheiks, and by his unrivalled genius for organization and generalship, in a singularly short time to put down the revolt entirely and to recall rebellious Africa to its allegiance (end of 517).

During this war the patriot party had kept silence; now it spoke out the louder. On the one hand this catastrophe had brought to light the utterly corrupt and pernicious character of the ruling oligarchy, their incapacity, their coterie-policy, their leanings towards the Romans. On the other hand the seizure of Sardinia, and the threatening attitude which Rome on that occasion assumed, showed plainly even to the humblest that a declaration of war by Rome was constantly hanging like the sword of Damocles over Carthage, and that, if Carthage in her present circumstances went to war with Rome, the consequence must necessarily be the downfall of the Phoenician dominion in Libya. Probably there were in Carthage not a few who, despairing of the future of their country, counselled emigration to the islands of the Atlantic; who could blame them? But minds of the nobler order disdain to save themselves apart from their nation, and great natures enjoy the privilege of deriving enthusiasm from circumstances in which the multitude of good men despair. They accepted the new conditions just as Rome dictated them; no course was left but to submit and, adding fresh bitterness to their former hatred, carefully to cherish and husband resentment—that last resource of an injured nation. They then took steps towards a political reform.⁽¹⁾ They had become sufficiently convinced of the incorrigibility of the party in power: the fact that the governing lords had even in the last war neither forgotten their spite

Page 508

nor learned greater wisdom, was shown by the effrontery bordering on simplicity with which they now instituted proceedings against Hamilcar as the originator of the mercenary war, because he had without full powers from the government made promises of money to his Sicilian soldiers. Had the club of officers and popular leaders desired to overthrow this rotten and wretched government, it would hardly have encountered much difficulty in Carthage itself; but it would have met with more formidable obstacles in Rome, with which the chiefs of the government in Carthage already maintained relations that bordered on treason. To all the other difficulties of the position there fell to be added the circumstance, that the means of saving their country had to be created without allowing either the Romans, or their own government with its Roman leanings, to become rightly aware of what was doing.

Hamilcar Commander-in-Chief

So they left the constitution untouched, and the chiefs of the government in full enjoyment of their exclusive privileges and of the public property. It was merely proposed and carried, that of the two commanders-in-chief, who at the end of the Libyan war were at the head of the Carthaginian troops, Hanno and Hamilcar, the former should be recalled, and the latter should be nominated commander-in-chief for all Africa during an indefinite period. It was arranged that he should hold a position independent of the governing corporations—his antagonists called it an unconstitutional monarchical power, Cato calls it a dictatorship—and that he could only be recalled and placed upon his trial by the popular assembly.⁽²⁾ Even the choice of a successor was to be vested not in the authorities of the capital, but in the army, that is, in the Carthaginians serving in the array as gerusiasts or officers, who were named in treaties also along with the general; of course the right of confirmation was reserved to the popular assembly at home. Whether this may or may not have been a usurpation, it clearly indicates that the war party regarded and treated the army as its special domain.

The commission which Hamilcar thus received sounded but little liable to exception. Wars with the Numidian tribes on the borders never ceased; only a short time previously the “city of a hundred gates,” Theveste (Tebessa), in the interior had been occupied by the Carthaginians. The task of continuing this border warfare, which was allotted to the new commander-in-chief of Africa, was not in itself of such importance as to prevent the Carthaginian government, which was allowed to do as it liked in its own immediate sphere, from tacitly conniving at the decrees passed in reference to the matter by the popular assembly; and the Romans did not perhaps recognize its significance at all.

Hamilcar's War Projects

The Army

The Citizens

Page 509

Thus there stood at the head of the army the one man, who had given proof in the Sicilian and in the Libyan wars that fate had destined him, if any one, to be the saviour of his country. Never perhaps was the noble struggle of man with fate waged more nobly than by him. The army was expected to save the state; but what sort of army? The Carthaginian civic militia had fought not badly under Hamilcar's leadership in the Libyan war; but he knew well, that it is one thing to lead out the merchants and artisans of a city, which is in the extremity of peril, for once to battle, and another to form them into soldiers. The patriotic party in Carthage furnished him with excellent officers, but it was of course almost exclusively the cultivated class that was represented in it. He had no citizen-militia, at most a few squadrons of Libyphoenician cavalry. The task was to form an army out of Libyan forced recruits and mercenaries; a task possible in the hands of a general like Hamilcar, but possible even for him only on condition that he should be able to pay his men punctually and amply. But he had learned, by experience in Sicily, that the state revenues of Carthage were expended in Carthage itself on matters much more needful than the payment of the armies that fought against the enemy. The warfare which he waged, accordingly, had to support itself, and he had to carry out on a great scale what he had already attempted on a smaller scale at Monte Pellegrino. But further, Hamilcar was not only a military chief, he was also a party leader. In opposition to the implacable governing party, which eagerly but patiently waited for an opportunity of overthrowing him, he had to seek support among the citizens; and although their leaders might be ever so pure and noble, the multitude was deeply corrupt and accustomed by the unhappy system of corruption to give nothing without being paid for it. In particular emergencies, indeed, necessity or enthusiasm might for the moment prevail, as everywhere happens even with the most venal corporations; but, if Hamilcar wished to secure the permanent support of the Carthaginian community for his plan, which at the best could only be carried out after a series of years, he had to supply his friends at home with regular consignments of money as the means of keeping the mob in good humour. Thus compelled to beg or to buy from the lukewarm and venal multitude the permission to save it; compelled to bargain with the arrogance of men whom he hated and whom he had constantly conquered, at the price of humiliation and of silence, for the respite indispensable for his ends; compelled to conceal from those despised traitors to their country, who called themselves the lords of his native city, his plans and his contempt—the noble hero stood with few like-minded friends between enemies without and enemies within, building upon the irresolution of the one and of the other, at once deceiving both and defying both, if only he might gain means,

Page 510

money, and men for the contest with a land which, even were the army ready to strike the blow, it seemed difficult to reach and scarce possible to vanquish. He was still a young man, little beyond thirty, but he had apparently, when he was preparing for his expedition, a foreboding that he would not be permitted to attain the end of his labours, or to see otherwise than afar off the promised land. When he left Carthage he enjoined his son Hannibal, nine years of age, to swear at the altar of the supreme God eternal hatred to the Roman name, and reared him and his younger sons Hasdrubal and Mago—the “lion’s brood,” as he called them—in the camp as the inheritors of his projects, of his genius, and of his hatred.

Hamilcar Proceed to Spain Spanish Kingdom of the Barcides

The new commander-in-chief of Libya departed from Carthage immediately after the termination of the mercenary war (perhaps in the spring of 518). He apparently meditated an expedition against the free Libyans in the west. His army, which was especially strong in elephants, marched along the coast; by its side sailed the fleet, led by his faithful associate Hasdrubal. Suddenly tidings came that he had crossed the sea at the Pillars of Hercules and had landed in Spain, where he was waging war with the natives—with people who had done him no harm, and without orders from his government, as the Carthaginian authorities complained. They could not complain at any rate that he neglected the affairs of Africa; when the Numidians once more rebelled, his lieutenant Hasdrubal so effectually routed them that for a long period there was tranquillity on the frontier, and several tribes hitherto independent submitted to pay tribute. What he personally did in Spain, we are no longer able to trace in detail. His achievements compelled Cato the elder, who, a generation after Hamilcar’s death, beheld in Spain the still fresh traces of his working, to exclaim, notwithstanding all his hatred of the Carthaginians, that no king was worthy to be named by the side of Hamilcar Barcas. The results still show to us, at least in a general way, what was accomplished by Hamilcar as a soldier and a statesman in the last nine years of his life (518-526)—till in the flower of his age, fighting bravely in the field of battle, he met his death like Scharnhorst just as his plans were beginning to reach maturity—and what during the next eight years (527-534) the heir of his office and of his plans, his son-in-law Hasdrubal, did to prosecute, in the spirit of the master, the work which Hamilcar had begun. Instead of the small entrepot for trade, which, along with the protectorate over Gades, was all that Carthage had hitherto possessed on the Spanish coast, and which she had treated as a dependency of Libya, a Carthaginian kingdom was founded in Spain by the generalship of Hamilcar, and confirmed by the adroit statesmanship of Hasdrubal. The fairest regions of Spain, the southern and eastern coasts,

Page 511

became Phoenician provinces. Towns were founded; above all, “Spanish Carthage” (Cartagena) was established by Hasdrubal on the only good harbour along the south coast, containing the splendid “royal castle” of its founder. Agriculture flourished, and, still more, mining in consequence of the fortunate discovery of the silver-mines of Cartagena, which a century afterwards had a yearly produce of more than 360,000 pounds (36,000,000 sesterces). Most of the communities as far as the Ebro became dependent on Carthage and paid tribute to it. Hasdrubal skilfully by every means, even by intermarriages, attached the chiefs to the interests of Carthage. Thus Carthage acquired in Spain a rich market for its commerce and manufactures; and not only did the revenues of the province sustain the army, but there remained a balance to be remitted to Carthage and reserved for future use. The province formed and at the same time trained the army; regular levies took place in the territory subject to Carthage; the prisoners of war were introduced into the Carthaginian corps. Contingents and mercenaries, as many as were desired, were supplied by the dependent communities. During his long life of warfare the soldier found in the camp a second home, and found a substitute for patriotism in fidelity to his standard and enthusiastic attachment to his great leaders. Constant conflicts with the brave Iberians and Celts created a serviceable infantry, to co-operate with the excellent Numidian cavalry.

The Carthaginian Government and the Barcides

So far as Carthage was concerned, the Barcides were allowed to go on. Since the citizens were not asked for regular contributions, but on the contrary some benefit accrued to them and commerce recovered in Spain what it had lost in Sicily and Sardinia, the Spanish war and the Spanish army with its brilliant victories and important successes soon became so popular that it was even possible in particular emergencies, such as after Hamilcar’s fall, to effect the despatch of considerable reinforcements of African troops to Spain; and the governing party, whether well or ill affected, had to maintain silence, or at any rate to content themselves with complaining to each other or to their friends in Rome regarding the demagogic officers and the mob.

The Roman Government and the Barcides

On the part of Rome too nothing took place calculated seriously to alter the course of Spanish affairs. The first and chief cause of the inactivity of the Romans was undoubtedly their very want of acquaintance with the circumstances of the remote peninsula—which was certainly also Hamilcar’s main reason for selecting Spain and not, as might otherwise have been possible, Africa itself for the execution of his plan. The explanations with which the Carthaginian generals met the Roman commissioners sent to Spain to procure information on the spot, and their assurances that all this was done only to provide the means of promptly

Page 512

paying the war-contributions to Rome, could not possibly find belief in the senate. But they probably discerned only the immediate object of Hamilcar's plans, viz. to procure compensation in Spain for the tribute and the traffic of the islands which Carthage had lost; and they deemed an aggressive war on the part of the Carthaginians, and in particular an invasion of Italy from Spain—as is evident both from express statements to that effect and from the whole state of the case—as absolutely impossible. Many, of course, among the peace party in Carthage saw further; but, whatever they might think, they could hardly be much inclined to enlighten their Roman friends as to the impending storm, which the Carthaginian authorities had long been unable to prevent, for that step would accelerate, instead of averting, the crisis; and even if they did so, such denunciations proceeding from partisans would justly be received with great caution at Rome. By degrees, certainly, the inconceivably rapid and mighty extension of the Carthaginian power in Spain could not but excite the observation and awaken the apprehensions of the Romans. In fact, in the course of the later years before the outbreak of war, they did attempt to set bounds to it. About the year 528, mindful of their new-born Hellenism, they concluded an alliance with the two Greek or semi-Greek towns on the east coast of Spain, Zacynthus or Saguntum (Murviedro, not far from Valencia), and Emporiae (Ampurias); and when they acquainted the Carthaginian general Hasdrubal that they had done so, they at the same time warned him not to push his conquests over the Ebro, with which he promised compliance. This was not done by any means to prevent an invasion of Italy by the land-route—no treaty could fetter the general who undertook such an enterprise—but partly to set a limit to the material power of the Spanish Carthaginians which began to be dangerous, partly to secure the free communities between the Ebro and the Pyrenees whom Rome thus took under her protection, a basis of operations in case of its being necessary to land and make war in Spain. In reference to the impending war with Carthage, which the senate did not fail to see was inevitable, they hardly apprehended any greater inconvenience from the events that had occurred in Spain than that they might be compelled to send some legions thither, and that the enemy would be somewhat better provided with money and soldiers than, without Spain, he would have been; they were at any rate firmly resolved, as the plan of the campaign of 536 shows and as indeed could not but be the case, to begin and terminate the next war in Africa, —a course which would at the same time decide the fate of Spain. Further grounds for delay were suggested during the first years by the instalments from Carthage, which a declaration of war would have cut off, and then by the death of Hamilcar, which probably induced friends and foes to think that his projects must have

Page 513

died with him. Lastly, during the latter years when the senate certainly began, to apprehend that it was not prudent long to delay the renewal of the war, there was the very intelligible wish to dispose of the Gauls in the valley of the Po in the first instance, for these, threatened with extirpation, might be expected to avail themselves of any serious war undertaken by Rome to allure the Transalpine tribes once more to Italy, and to renew those Celtic migrations which were still fraught with very great peril. That it was not regard either for the Carthaginian peace party or for existing treaties which withheld the Romans from action, is self-evident; moreover, if they desired war, the Spanish feuds furnished at any moment a ready pretext. The conduct of Rome in this view is by no means unintelligible; but as little can it be denied that the Roman senate in dealing with this matter displayed shortsightedness and slackness—faults which were still more inexcusably manifested in their mode of dealing at the same epoch with Gallic affairs. The policy of the Romans was always more remarkable for tenacity, cunning, and consistency, than for grandeur of conception or power of rapid organization—qualities in which the enemies of Rome from Pyrrhus down to Mithradates often surpassed her.

Hannibal

Thus the smiles of fortune inaugurated the brilliantly conceived project of Hamilcar. The means of war were acquired—a numerous army accustomed to combat and to conquer, and a constantly replenished exchequer; but, in order that the right moment might be discovered for the struggle and that the right direction might be given to it, there was wanted a leader. The man, whose head and heart had in a desperate emergency and amidst a despairing people paved the way for their deliverance, was no more, when it became possible to carry out his design. Whether his successor Hasdrubal forbore to make the attack because the proper moment seemed to him to have not yet come, or whether, more a statesman than a general, he believed himself unequal to the conduct of the enterprise, we are unable to determine. When, at the beginning of 534, he fell by the hand of an assassin, the Carthaginian officers of the Spanish army summoned to fill his place Hannibal, the eldest son of Hamilcar. He was still a young man—born in 505, and now, therefore, in his twenty-ninth year; but his had already been a life of manifold experience. His first recollections pictured to him his father fighting in a distant land and conquering on Ercte; he had keenly shared that unconquered father's feelings on the peace of Catulus, on the bitter return home, and throughout the horrors of the Libyan war. While yet a boy, he had followed his father to the camp; and he soon distinguished himself. His light and firmly-knit frame made him an excellent runner and fencer, and a fearless rider at full speed; the privation of sleep did not affect him, and he knew like a soldier how to enjoy or to dispense with

Page 514

food. Although his youth had been spent in the camp, he possessed such culture as belonged to the Phoenicians of rank in his day; in Greek, apparently after he had become a general, he made such progress under the guidance of his confidant Sosilus of Sparta as to be able to compose state papers in that language. As he grew up, he entered the army of his father, to perform his first feats of arms under the paternal eye and to see him fall in battle by his side. Thereafter he had commanded the cavalry under his sister's husband, Hasdrubal, and distinguished himself by brilliant personal bravery as well as by his talents as a leader. The voice of his comrades now summoned him—the tried, although youthful general—to the chief command, and he could now execute the designs for which his father and his brother-in-law had lived and died. He took up the inheritance, and he was worthy of it. His contemporaries tried to cast stains of various sorts on his character; the Romans charged him with cruelty, the Carthaginians with covetousness; and it is true that he hated as only Oriental natures know how to hate, and that a general who never fell short of money and stores can hardly have been other than covetous. But though anger and envy and meanness have written his history, they have not been able to mar the pure and noble image which it presents. Laying aside wretched inventions which furnish their own refutation, and some things which his lieutenants, particularly Hannibal Monomachus and Mago the Samnite, were guilty of doing in his name, nothing occurs in the accounts regarding him which may not be justified under the circumstances, and according to the international law, of the times; and all agree in this, that he combined in rare perfection discretion and enthusiasm, caution and energy. He was peculiarly marked by that inventive craftiness, which forms one of the leading traits of the Phoenician character; he was fond of taking singular and unexpected routes; ambushes and stratagems of all sorts were familiar to him; and he studied the character of his antagonists with unprecedented care. By an unrivalled system of espionage—he had regular spies even in Rome—he kept himself informed of the projects of the enemy; he himself was frequently seen wearing disguises and false hair, in order to procure information on some point or other. Every page of the history of this period attests his genius in strategy; and his gifts as a statesman were, after the peace with Rome, no less conspicuously displayed in his reform of the Carthaginian constitution, and in the unparalleled influence which as a foreign exile he exercised in the cabinets of the eastern powers. The power which he wielded over men is shown by his incomparable control over an army of various nations and many tongues—an army which never in the worst times mutinied against him. He was a great man; wherever he went, he riveted the eyes of all.

Rupture between Rome and Carthage

Page 515

Hannibal resolved immediately after his nomination (in the spring of 534) to commence the war. The land of the Celts was still in a ferment, and a war seemed imminent between Rome and Macedonia: he had good reason now to throw off the mask without delay and to carry the war whithersoever he pleased, before the Romans began it at their own convenience with a descent on Africa. His army was soon ready to take the field, and his exchequer was filled by some razzias on a great scale; but the Carthaginian government showed itself far from desirous of despatching the declaration of war to Rome. The place of Hasdrubal, the patriotic national leader, was even more difficult to fill in Carthage than that of Hasdrubal the general in Spain; the peace party had now the ascendancy at home, and persecuted the leaders of the war party with political indictments. The rulers who had already cut down and mutilated the plans of Hamilcar were by no means inclined to allow the unknown young man, who now commanded in Spain, to vent his youthful patriotism at the expense of the state; and Hannibal hesitated personally to declare war in open opposition to the legitimate authorities. He tried to provoke the Saguntines to break the peace; but they contented themselves with making a complaint to Rome. Then, when a commission from Rome appeared, he tried to drive it to a declaration of war by treating it rudely; but the commissioners saw how matters stood: they kept silence in Spain, with a view to lodge complaints at Carthage and to report at home that Hannibal was ready to strike and that war was imminent. Thus the time passed away; accounts had already come of the death of Antigonus Doson, who had suddenly died nearly at the same time with Hasdrubal; in Cisalpine Gaul the establishment of fortresses was carried on by the Romans with redoubled rapidity and energy; preparations were made in Rome for putting a speedy end in the course of the next spring to the insurrection in Illyria. Every day was precious; Hannibal formed his resolution. He sent summary intimation to Carthage that the Saguntines were making aggressions on the Torboletes, subjects of Carthage, and he must therefore attack them; and without waiting for a reply he began in the spring of 535 the siege of a town which was in alliance with Rome, or, in other words, war against Rome. We may form some idea of the views and counsels that would prevail in Carthage from the impression produced in certain circles by York's capitulation. All "respectable men," it was said, disapproved an attack made "without orders"; there was talk of disavowal, of surrendering the daring officer. But whether it was that dread of the army and of the multitude nearer home outweighed in the Carthaginian council the fear of Rome; or that they perceived the impossibility of retracing such a step once taken; or that the mere -vis inertiae-prevented any definite action, they resolved at length to resolve on nothing and, if not to wage war, to let it nevertheless

Page 516

be waged. Saguntum defended itself, as only Spanish towns know how to conduct defence: had the Romans showed but a tithe of the energy of their clients, and not trifled away their time during the eight months' siege of Saguntum in the paltry warfare with Illyrian brigands, they might, masters as they were of the sea and of places suitable for landing, have spared themselves the disgrace of failing to grant the protection which they had promised, and might perhaps have given a different turn to the war. But they delayed, and the town was at length taken by storm. When Hannibal sent the spoil for distribution to Carthage, patriotism and zeal for war were roused in the hearts of many who had hitherto felt nothing of the kind, and the distribution cut off all prospect of coming to terms with Rome. Accordingly, when after the destruction of Saguntum a Roman embassy appeared at Carthage and demanded the surrender of the general and of the gerusiasts present in the camp, and when the Roman spokesman, interrupting an attempt at justification, broke off the discussion and, gathering up his robe, declared that he held in it peace and war and that the gerusia might choose between them, the gerusiasts mustered courage to reply that they left it to the choice of the Roman; and when he offered war, they accepted it (in the spring of 536).

Preparations for Attacking Italy

Hannibal, who had lost a whole year through the obstinate resistance of the Saguntines, had as usual retired for the winter of 535-6 to Cartagena, to make all his preparations on the one hand for the attack of Italy, on the other for the defence of Spain and Africa; for, as he, like his father and his brother-in-law, held the supreme command in both countries, it devolved upon him to take measures also for the protection of his native land. The whole mass of his forces amounted to about 120,000 infantry and 16,000 cavalry; he had also 58 elephants, 32 quinqueremes manned, and 18 not manned, besides the elephants and vessels remaining at the capital. Excepting a few Ligurians among the light troops, there were no mercenaries in this Carthaginian army; the troops, with the exception of some Phoenician squadrons, consisted mainly of the Carthaginian subjects called out for service—Libyans and Spaniards. To insure the fidelity of the latter the general, who knew the men with whom he had to deal, gave them as a proof of his confidence a general leave of absence for the whole winter; while, not sharing the narrow-minded exclusiveness of Phoenician patriotism, he promised to the Libyans on his oath the citizenship of Carthage, should they return to Africa victorious. This mass of troops however was only destined in part for the expedition to Italy. Some 20,000 men were sent to Africa, the smaller portion of them proceeding to the capital and the Phoenician territory proper, the majority to the western point of Africa. For the protection of Spain 12,000 infantry, 2500 cavalry, and nearly the half of the

Page 517

elephants were left behind, in addition to the fleet stationed there; the chief command and the government of Spain were entrusted to Hannibal's younger brother Hasdrubal. The immediate territory of Carthage was comparatively weakly garrisoned, because the capital afforded in case of need sufficient resources; in like manner a moderate number of infantry sufficed for the present in Spain, where new levies could be procured with ease, whereas a comparatively large proportion of the arms specially African—horses and elephants—was retained there. The chief care was bestowed in securing the communications between Spain and Africa: with that view the fleet remained in Spain, and western Africa was guarded by a very strong body of troops. The fidelity of the troops was secured not only by hostages collected from the Spanish communities and detained in the stronghold of Saguntum, but by the removal of the soldiers from the districts where they were raised to other quarters: the east African militia were moved chiefly to Spain, the Spanish to Western Africa, the West African to Carthage. Adequate provision was thus made for defence. As to offensive measures, a squadron of 20 quinqueremes with 1000 soldiers on board was to sail from Carthage for the west coast of Italy and to pillage it, and a second of 25 sail was, if possible, to re-establish itself at Lilybaeum; Hannibal believed that he might count upon the government making this moderate amount of exertion. With the main army he determined in person to invade Italy; as was beyond doubt part of the original plan of Hamilcar. A decisive attack on Rome was only possible in Italy, as a similar attack on Carthage was only possible in Libya; as certainly as Rome meant to begin her next campaign with the latter, so certainly ought Carthage not to confine herself at the outset either to any secondary object of operations, such as Sicily, or to mere defence—defeat would in any case involve equal destruction, but victory would not yield equal fruit.

Method of Attack

But how could Italy be attacked? He might succeed in reaching the peninsula by sea or by land; but if the project was to be no mere desperate adventure, but a military expedition with a strategic aim, a nearer basis for its operations was requisite than Spain or Africa. Hannibal could not rely for support on a fleet and a fortified harbour, for Rome was now mistress of the sea. As little did the territory of the Italian confederacy present any tenable basis. If in very different times, and in spite of Hellenic sympathies, it had withstood the shock of Pyrrhus, it was not to be expected that it would now fall to pieces on the appearance of the Phoenician general; an invading army would without doubt be crushed between the network of Roman fortresses and the firmly-consolidated confederacy. The land of the Ligurians and Celts alone could be to Hannibal, what Poland was to Napoleon in his very similar Russian campaigns. These

Page 518

tribes still smarting under their scarcely ended struggle for independence, alien in race from the Italians, and feeling their very existence endangered by the chain of Roman fortresses and highways whose first coils were even now being fastened around them, could not but recognize their deliverers in the Phoenician army (which numbered in its ranks numerous Spanish Celts), and would serve as a first support for it to fall back upon—a source whence it might draw supplies and recruits. Already formal treaties were concluded with the Boii and the Insubres, by which they bound themselves to send guides to meet the Carthaginian army, to procure for it a good reception from the cognate tribes and supplies along its route, and to rise against the Romans as soon as it should set foot on Italian ground. In fine, the relations of Rome with the east led the Carthaginians to this same quarter. Macedonia, which by the victory of Sellasia had re-established its sovereignty in the Peloponnesus, was in strained relations with Rome; Demetrius of Pharos, who had exchanged the Roman alliance for that of Macedonia and had been dispossessed by the Romans, lived as an exile at the Macedonian court, and the latter had refused the demand which the Romans made for his surrender. If it was possible to combine the armies from the Guadalquivir and the Karasu anywhere against the common foe, it could only be done on the Po. Thus everything directed Hannibal to Northern Italy; and that the eyes of his father had already been turned to that quarter, is shown by the reconnoitring party of Carthaginians, whom the Romans to their great surprise encountered in Liguria in 524.

The reason for Hannibal's preference of the land route to that by sea is less obvious; for that neither the maritime supremacy of the Romans nor their league with Massilia could have prevented a landing at Genoa, is evident, and was shown by the sequel. Our authorities fail to furnish us with several of the elements, on which a satisfactory answer to this question would depend, and which cannot be supplied by conjecture. Hannibal had to choose between two evils. Instead of exposing himself to the unknown and less calculable contingencies of a sea voyage and of naval war, it must have seemed to him the better course to accept the assurances, which beyond doubt were seriously meant, of the Boii and Insubres, and the more so that, even if the army should land at Genoa, it would still have mountains to cross; he could hardly know exactly, how much smaller are the difficulties presented by the Apennines at Genoa than by the main chain of the Alps. At any rate the route which he took was the primitive Celtic route, by which many much larger hordes had crossed the Alps: the ally and deliverer of the Celtic nation might without temerity venture to traverse it.

Departure of Hannibal

Page 519

So Hannibal collected the troops, destined for the grand army, in Cartagena at the beginning of the favourable season; there were 90,000 infantry and 12,000 cavalry, of whom about two-thirds were Africans and a third Spaniards. The 37 elephants which they took with them were probably destined rather to make an impression on the Gauls than for serious warfare. Hannibal's infantry no longer needed, like that led by Xanthippus, to shelter itself behind a screen of elephants, and the general had too much sagacity to employ otherwise than sparingly and with caution that two-edged weapon, which had as often occasioned the defeat of its own as of the enemy's army. With this force the general set out in the spring of 536 from Cartagena towards the Ebro. He so far informed his soldiers as to the measures which he had taken, particularly as to the connections he had entered into with the Celts and the resources and object of the expedition, that even the common soldier, whose military instincts lengthened war had developed, felt the clear perception and the steady hand of his leader, and followed him with implicit confidence to the unknown and distant land; and the fervid address, in which he laid before them the position of their country and the demands of the Romans, the slavery certainly reserved for their dear native land, and the disgrace of the imputation that they could surrender their beloved general and his staff, kindled a soldierly and patriotic ardour in the hearts of all.

Position of Rome

Their Uncertain Plans for War

The Roman state was in a plight, such as may occur even in firmly-established and sagacious aristocracies. The Romans knew doubtless what they wished to accomplish, and they took various steps; but nothing was done rightly or at the right time. They might long ago have been masters of the gates of the Alps and have settled matters with the Celts; the latter were still formidable, and the former were open. They might either have had friendship, with Carthage, had they honourably kept the peace of 513, or, had they not been disposed for peace, they might long ago have conquered Carthage: the peace was practically broken by the seizure of Sardinia, and they allowed the power of Carthage to recover itself undisturbed for twenty years. There was no great difficulty in maintaining peace with Macedonia; but they had forfeited her friendship for a trifling gain. There must have been a lack of some leading statesman to take a connected and commanding view of the position of affairs; on all hands either too little was done, or too much. Now the war began at a time and at a place which they had allowed the enemy to determine; and, with all their well-founded conviction of military superiority, they were perplexed as to the object to be aimed at and the course to be followed in their first operations. They had at their disposal more than half a million of serviceable soldiers; the Roman cavalry alone was less good, and relatively

Page 520

less numerous, than the Carthaginian, the former constituting about a tenth, the latter an eighth, of the whole number of troops taking the field. None of the states affected by the war had any fleet corresponding to the Roman fleet of 220 quinqueremes, which had just returned from the Adriatic to the western sea. The natural and proper application of this crushing superiority of force was self-evident. It had been long settled that the war ought to be opened with a landing in Africa. The subsequent turn taken by events had compelled the Romans to embrace in their scheme of the war a simultaneous landing in Spain, chiefly to prevent the Spanish army from appearing before the walls of Carthage. In accordance with this plan they ought above all, when the war had been practically opened by Hannibal's attack on Saguntum in the beginning of 535, to have thrown a Roman army into Spain before the town fell; but they neglected the dictates of interest no less than of honour. For eight months Saguntum held out in vain: when the town passed into other hands, Rome had not even equipped her armament for landing in Spain. The country, however, between the Ebro and the Pyrenees was still free, and its tribes were not only the natural allies of the Romans, but had also, like the Saguntines, received from Roman emissaries promises of speedy assistance. Catalonia may be reached by sea from Italy in not much longer time than from Cartagena by and: had the Romans started, like the Phoenicians, in April, after the formal declaration of war that had taken place in the interval, Hannibal might have encountered the Roman legions on the line of the Ebro.

Hannibal on the Ebro

At length, certainly, the greater part of the army and of the fleet was got ready for the expedition to Africa, and the second consul Publius Cornelius Scipio was ordered to the Ebro; but he took time, and when an insurrection broke out on the Po, he allowed the army that was ready for embarkation to be employed there, and formed new legions for the Spanish expedition. So although Hannibal encountered on the Ebro very vehement resistance, it proceeded only from the natives; and, as under existing circumstances time was still more precious to him than the blood of his men, he surmounted the opposition after some months with the loss of a fourth part of his army, and reached the line of the Pyrenees. That the Spanish allies of Rome would be sacrificed a second time by that delay might have been as certainly foreseen, as the delay itself might have been easily avoided; but probably even the expedition to Italy itself, which in the spring of 536 must not have been anticipated in Rome, would have been averted by the timely appearance of the Romans in Spain. Hannibal had by no means the intention of sacrificing his Spanish "kingdom," and throwing himself like a desperado on Italy. The time which he had spent in the siege of Saguntum and in the reduction of Catalonia, and the considerable

Page 521

corps which he left behind for the occupation of the newly-won territory between the Ebro and the Pyrenees, sufficiently show that, had a Roman army disputed the possession of Spain with him, he would not have been content to withdraw from it; and—which was the main point—had the Romans been able to delay his departure from Spain for but a few weeks, winter would have closed the passes of the Alps before Hannibal reached them, and the African expedition would have departed without hindrance for its destination.

Hannibal in Gaul
Scipio at Massilia
Passage of the Rhone

Arrived at the Pyrenees, Hannibal sent home a portion of his troops; a measure which he had resolved on from the first with the view of showing to the soldiers how confident their general was of success, and of checking the feeling that his enterprise was one of those from which there is no return home. With an army of 50,000 infantry and 9000 cavalry, entirely veteran soldiers, he crossed the Pyrenees without difficulty, and then took the coast route by Narbonne and Nimes through the Celtic territory, which was opened to the army partly by the connections previously formed, partly by Carthaginian gold, partly by arms. It was not till it arrived in the end of July at the Rhone opposite Avignon, that a serious resistance appeared to await it. The consul Scipio, who on his voyage to Spain had landed at Massilia (about the end of June), had there been informed that he had come too late and that Hannibal had crossed not only the Ebro but the Pyrenees. On receiving these accounts, which appear to have first opened the eyes of the Romans to the course and the object of Hannibal, the consul had temporarily given up his expedition to Spain, and had resolved in connection with the Celtic tribes of that region, who were under the influence of the Massiliots and thereby under that of Rome, to receive the Phoenicians on the Rhone, and to obstruct their passage of the river and their march into Italy. Fortunately for Hannibal, opposite to the point at which he meant to cross, there lay at the moment only the general levy of the Celts, while the consul himself with his army of 22,000 infantry and 2000 horse was still in Massilia, four days' march farther down the stream. The messengers of the Gallic levy hastened to inform him. It was the object of Hannibal to convey his army with its numerous cavalry and elephants across the rapid stream under the eyes of the enemy, and before the arrival of Scipio; and he possessed not a single boat. Immediately by his directions all the boats belonging to the numerous navigators of the Rhone in the neighbourhood were bought up at any price, and the deficiency of boats was supplied by rafts made from felled trees; and in fact the whole numerous army could be conveyed over in one day. While this was being done, a strong division under Hanno, son of Bomilcar, proceeded by forced marches up the stream till they reached a suitable

Page 522

point for crossing, which they found undefended, situated two short days' march above Avignon. Here they crossed the river on hastily constructed rafts, with the view of then moving down on the left bank and taking the Gauls, who were barring the passage of the main army, in the rear. On the morning of the fifth day after they had reached the Rhone, and of the third after Hanno's departure, the smoke-signals of the division that had been detached rose up on the opposite bank and gave to Hannibal the anxiously awaited summons for the crossing. Just as the Gauls, seeing that the enemy's fleet of boats began to move, were hastening to occupy the bank, their camp behind them suddenly burst into flames. Surprised and divided, they were unable either to withstand the attack or to resist the passage, and they dispersed in hasty flight.

Scipio meanwhile held councils of war in Massilia as to the proper mode of occupying the ferries of the Rhone, and was not induced to move even by the urgent messages that came from the leaders of the Celts. He distrusted their accounts, and he contented himself with detaching a weak Roman cavalry division to reconnoitre on the left bank of the Rhone. This detachment found the whole enemy's army already transported to that bank, and occupied in bringing over the elephants which alone remained on the right bank of the stream; and, after it had warmly engaged some Carthaginian squadrons in the district of Avignon, merely for the purpose of enabling it to complete its reconnaissance—the first encounter of the Romans and Phoenicians in this war—it hastily returned to report at head-quarters. Scipio now started in the utmost haste with all his troops for Avignon; but, when he arrived there, even the Carthaginian cavalry that had been left behind to cover the passage of the elephants had already taken its departure three days ago, and nothing remained for the consul but to return with weary troops and little credit to Massilia, and to revile the "cowardly flight" of the Punic leader. Thus the Romans had for the third time through pure negligence abandoned their allies and an important line of defence; and not only so, but by passing after this first blunder from mistaken slackness to mistaken haste, and by still attempting without any prospect of success to do what might have been done with so much certainty a few days before, they let the real means of repairing their error pass out of their hands. When once Hannibal was in the Celtic territory on the Roman side of the Rhone, he could no longer be prevented from reaching the Alps; but if Scipio had at the first accounts proceeded with his whole army to Italy—the Po might have been reached by way of Genoa in seven days—and had united with his corps the weak divisions in the valley of the Po, he might have at least prepared a formidable reception for the enemy. But not only did he lose precious time in the march to Avignon, but, capable as otherwise he was, he wanted either the political courage or the military sagacity to change the destination of his corps as the change of circumstances required. He sent the main body under his brother Gnaeus to Spain, and returned himself with a few men to Pisae.

Page 523

Hannibal's Passage of the Alps

Hannibal, who after the passage of the Rhone had in a great assembly of the army explained to his troops the object of his expedition, and had brought forward the Celtic chief Magilus himself, who had arrived from the valley of the Po, to address the army through an interpreter, meanwhile continued his march to the passes of the Alps without obstruction. Which of these passes he should choose, could not be at once determined either by the shortness of the route or by the disposition of the inhabitants, although he had no time to lose either in circuitous routes or in combat. He had necessarily to select a route which should be practicable for his baggage, his numerous cavalry, and his elephants, and in which an army could procure sufficient means of subsistence either by friendship or by force; for, although Hannibal had made preparations to convey provisions after him on beasts of burden, these could only meet for a few days the wants of an army which still, notwithstanding its great losses, amounted to nearly 50,000 men. Leaving out of view the coast route, which Hannibal abstained from taking not because the Romans barred it, but because it would have led him away from his destination, there were only two routes of note leading across the Alps from Gaul to Italy in ancient times: (3) the pass of the Cottian Alps (Mont Genevre) leading into the territory of the Taurini (by Susa or Fenestrelles to Turin), and that of the Graian Alps (the Little St. Bernard) leading into the territory of the Salassi (to Aosta and Ivrea). The former route is the shorter; but, after leaving the valley of the Rhone, it passes by the impracticable and unfruitful river-valleys of the Drac, the Romanche, and the upper Durance, through a difficult and poor mountain country, and requires at least a seven or eight days' mountain march. A military road was first constructed there by Pompeius, to furnish a shorter communication between the provinces of Cisalpine and Transalpine Gaul.

The route by the Little St. Bernard is somewhat longer; but after crossing the first Alpine wall that forms the eastern boundary of the Rhone valley, it keeps by the valley of the upper Isere, which stretches from Grenoble by way of Chambery up to the very foot of the Little St. Bernard or, in other words, of the chain of the higher Alps, and is the broadest, most fertile and most populous of all the Alpine valleys. Moreover, the pass of the Little St. Bernard, while not the lowest of all the natural passes of the Alps, is by far the easiest; although no artificial road was constructed there, an Austrian corps with artillery crossed the Alps by that route in 1815. And lastly this route, which only leads over two mountain ridges, has been from the earliest times the great military route from the Celtic to the Italian territory. The Carthaginian army had thus in fact no choice. It was a fortunate coincidence, but not a motive influencing the decision of Hannibal, that the Celtic tribes allied with him in Italy inhabited the country up to the Little St. Bernard, while the route by Mont Genevre would have brought him at first into the territory of the Taurini, who were from ancient times at feud with the Insubres.

Page 524

So the Carthaginian army marched in the first instance up the Rhone towards the valley of the upper Isere, not, as might be presumed, by the nearest route up the left bank of the lower Isere from Valence to Grenoble, but through the "island" of the Allobroges, the rich, and even then thickly peopled, low ground, which is enclosed on the north and west by the Rhone, on the south by the Isere, and on the east by the Alps. The reason of this movement was, that the nearest route would have led them through an impracticable and poor mountain-country, while the "island" was level and extremely fertile, and was separated by but a single mountain-wall from the valley of the upper Isere. The march along the Rhone into, and across, the "island" to the foot of the Alpine wall was accomplished in sixteen days: it presented little difficulty, and in the "island" itself Hannibal dexterously availed himself of a feud that had broken out between two chieftains of the Allobroges to attach to his interests one of the most important of the chiefs, who not only escorted the Carthaginians through the whole plain, but also supplied them with provisions, and furnished the soldiers with arms, clothing, and shoes. But the expedition narrowly escaped destruction at the crossing of the first Alpine chain, which rises precipitously like a wall, and over which only a single available path leads (over the Mont du Chat, near the hamlet Chevelu). The population of the Allobroges had strongly occupied the pass. Hannibal learned the state of matters early enough to avoid a surprise, and encamped at the foot, until after sunset the Celts dispersed to the houses of the nearest town; he then seized the pass in the night. Thus the summit was gained; but on the extremely steep path, which leads down from the summit to the lake of Bourget, the mules and horses slipped and fell. The assaults, which at suitable points were made by the Celts upon the army in march, were very annoying, not so much of themselves as by reason of the turmoil which they occasioned; and when Hannibal with his light troops threw himself from above on the Allobroges, these were chased doubtless without difficulty and with heavy loss down the mountain, but the confusion, in the train especially, was further increased by the noise of the combat. So, when after much loss he arrived in the plain, Hannibal immediately attacked the nearest town, to chastise and terrify the barbarians, and at the same time to repair as far as possible his loss in sumpter animals and horses. After a day's repose in the pleasant valley of Chambery the army continued its march up the Isere, without being detained either by want of supplies or by attacks so long as the valley continued broad and fertile. It was only when on the fourth day they entered the territory of the Ceutrones (the modern Tarantaise) where the valley gradually contracts, that they had again greater occasion to be on their guard. The Ceutrones received

Page 525

the army at the boundary of their country (somewhere about Conflans) with branches and garlands, furnished cattle for slaughter, guides, and hostages; and the Carthaginians marched through their territory as through a friendly land. When, however, the troops had reached the very foot of the Alps, at the point where the path leaves the Isere, and winds by a narrow and difficult defile along the brook Reclus up to the summit of the St. Bernard, all at once the militia of the Ceutrones appeared partly in the rear of the army, partly on the crests of the rocks enclosing the pass on the right and left, in the hope of cutting off the train and baggage. But Hannibal, whose unerring tact had seen in all those advances made by the Ceutrones nothing but the design of procuring at once immunity for their territory and a rich spoil, had in expectation of such an attack sent forward the baggage and cavalry, and covered the march with all his infantry. By this means he frustrated the design of the enemy, although he could not prevent them from moving along the mountain slopes parallel to the march of the infantry, and inflicting very considerable loss by hurling or rolling down stones. At the "white stone" (still called -la roche blanche-), a high isolated chalk cliff standing at the foot of the St. Bernard and commanding the ascent to it, Hannibal encamped with his infantry, to cover the march of the horses and sumpter animals laboriously climbing upward throughout the whole night; and amidst continual and very bloody conflicts he at length on the following day reached the summit of the pass. There, on the sheltered table-land which spreads to the extent of two and a half miles round a little lake, the source of the Doria, he allowed the army to rest. Despondency had begun to seize the minds of the soldiers. The paths that were becoming ever more difficult, the provisions failing, the marching through defiles exposed to the constant attacks of foes whom they could not reach, the sorely thinned ranks, the hopeless situation of the stragglers and the wounded, the object which appeared chimerical to all save the enthusiastic leader and his immediate staff—all these things began to tell even on the African and Spanish veterans. But the confidence of the general remained ever the same; numerous stragglers rejoined the ranks; the friendly Gauls were near; the watershed was reached, and the view of the descending path, so gladdening to the mountain-pilgrim, opened up: after a brief repose they prepared with renewed courage for the last and most difficult undertaking, —the downward march. In it the army was not materially annoyed by the enemy; but the advanced season—it was already the beginning of September—occasioned troubles in the descent, equal to those which had been occasioned in the ascent by the attacks of the adjoining tribes. On the steep and slippery mountain-slope along the Doria, where the recently-fallen snow had concealed and obliterated the paths, men and animals

Page 526

went astray and slipped, and were precipitated into the chasms. In fact, towards the end of the first day's march they reached a portion of the path about 200 paces in length, on which avalanches are constantly descending from the precipices of the Cramont that overhang it, and where in cold summers snow lies throughout the year. The infantry passed over; but the horses and elephants were unable to cross the smooth masses of ice, on which there lay but a thin covering of freshly-fallen snow, and the general encamped above the difficult spot with the baggage, the cavalry, and the elephants. On the following day the horsemen, by zealous exertion in entrenching, prepared a path for horses and beasts of burden; but it was not until after a further labour of three days with constant reliefs, that the half-famished elephants could at length be conducted over. In this way the whole army was after a delay of four days once more united; and after a further three days' march through the valley of the Doria, which was ever widening and displaying greater fertility, and whose inhabitants the Salassi, clients of the Insubres, hailed in the Carthaginians their allies and deliverers, the army arrived about the middle of September in the plain of Ivrea, where the exhausted troops were quartered in the villages, that by good nourishment and a fortnight's repose they might recruit from their unparalleled hardships. Had the Romans placed a corps, as they might have done, of 30,000 men thoroughly fresh and ready for action somewhere near Turin, and immediately forced on a battle, the prospects of Hannibal's great plan would have been very dubious; fortunately for him, once more, they were not where they should have been, and they did not disturb the troops of the enemy in the repose which was so greatly needed.(4)

Results

The object was attained, but at a heavy cost. Of the 50,000 veteran infantry and the 9000 cavalry, which the army had numbered at the crossing of the Pyrenees, more than half had been sacrificed in the conflicts, the marches, and the passages of the rivers. Hannibal now, according to his own statement, numbered not more than 20,000 infantry—of whom three-fifths were Libyans and two-fifths Spaniards—and 6000 cavalry, part of them doubtless dismounted: the comparatively small loss of the latter proclaimed the excellence of the Numidian cavalry no less than the consideration of the general in making a sparing use of troops so select. A march of 526 miles or about 33 moderate days' marching—the continuance and termination of which were disturbed by no special misfortunes on a great scale that could not be anticipated, but were, on the other hand, rendered possible only by incalculable pieces of good fortune and still more incalculable blunders of the enemy, and which yet not only cost such sacrifices, but so fatigued and demoralized the army, that it needed a prolonged rest in order to be again ready for action—is

Page 527

a military operation of doubtful value, and it may be questioned whether Hannibal himself regarded it as successful. Only in so speaking we may not pronounce an absolute censure on the general: we see well the defects of the plan of operations pursued by him, but we cannot determine whether he was in a position to foresee them—his route lay through an unknown land of barbarians—or whether any other plan, such as that of taking the coast road or of embarking at Cartagena or at Carthage, would have exposed him to fewer dangers. The cautious and masterly execution of the plan in its details at any rate deserves our admiration, and to whatever causes the result may have been due—whether it was due mainly to the favour of fortune, or mainly to the skill of the general—the grand idea of Hamilcar, that of taking up the conflict with Rome in Italy, was now realized. It was his genius that projected this expedition; and as the task of Stein and Scharnhorst was more difficult and nobler than that of York and Blucher, so the unerring tact of historical tradition has always dwelt on the last link in the great chain of preparatory steps, the passage of the Alps, with a greater admiration than on the battles of the Trasimene lake and of the plain of Cannae.

Notes for Chapter IV

1. Our accounts as to these events are not only imperfect but one-sided, for of course it was the version of the Carthaginian peace party which was adopted by the Roman annalists. Even, however, in our fragmentary and confused accounts (the most important are those of Fabius, in Polyb. iii. 8; Appian. Hisp. 4; and Diodorus, xxv. p. 567) the relations of the parties appear dearly enough. Of the vulgar gossip by which its opponents sought to blacken the “revolutionary combination” (—*etaireia ton ponerotaton anthropon*—) specimens may be had in Nepos (Ham. 3), to which it will be difficult perhaps to find a parallel.
2. The Barca family conclude the most important state treaties, and the ratification of the governing board is a formality (Pol. iii. 21). Rome enters her protest before them and before the senate (Pol. iii. 15). The position of the Barca family towards Carthage in many points resembles that of the Princes of Orange towards the States-General.
3. It was not till the middle ages that the route by Mont Cenis became a military road. The eastern passes, such as that over the Poenine Alps or the Great St. Bernard—which, moreover, was only converted into a military road by Caesar and Augustus—are, of course, in this case out of the question.
4. The much-discussed questions of topography, connected with this celebrated expedition, may be regarded as cleared up and substantially solved by the masterly investigations of Messrs. Wickham and Cramer. Respecting the chronological

questions, which likewise present difficulties, a few remarks may be exceptionally allowed to have a place here.

Page 528

When Hannibal reached the summit of the St. Bernard, “the peaks were already beginning to be thickly covered with snow” (Pol. iii. 54), snow lay on the route (Pol. iii. 55), perhaps for the most part snow not freshly fallen, but proceeding from the fall of avalanches. At the St. Bernard winter begins about Michaelmas, and the falling of snow in September; when the Englishmen already mentioned crossed the mountain at the end of August, they found almost no snow on their road, but the slopes on both sides were covered with it. Hannibal thus appears to have arrived at the pass in the beginning of September; which is quite compatible with the statement that he arrived there “when the winter was already approaching” —for —sunaptein ten tes pleiados dusin— (Pol. iii. 54) does not mean anything more than this, least of all, the day of the heliacal setting of the Pleiades (about 26th October); comp. Ideler, Chronol. i. 241.

If Hannibal reached Italy nine days later, and therefore about the middle of September, there is room for the events that occurred from that time up to the battle of the Trebia towards the end of December (—peri cheimerinas tropas—, Pol. iii. 72), and in particular for the transporting of the army destined for Africa from Lilybaeum to Placentia. This hypothesis further suits the statement that the day of departure was announced at an assembly of the army —upo ten earinen oran— (Pol. iii. 34), and therefore towards the end of March, and that the march lasted five (or, according to App. vii. 4, six) months. If Hannibal was thus at the St. Bernard in the beginning of September, he must have reached the Rhone at the beginning of August —for he spent thirty days in making his way from the Rhone thither —and in that case it is evident that Scipio, who embarked at the beginning of summer (Pol. iii. 41) and so at latest by the commencement of June, must have spent much time on the voyage or remained for a considerable period in singular inaction at Massilia.

CHAPTER V

The War under Hannibal to the Battle of Cannae

Hannibal and the Italian Celts

The appearance of the Carthaginian army on the Roman side of the Alps changed all at once the situation of affairs, and disconcerted the Roman plan of war. Of the two principal armies of the Romans, one had landed in Spain and was already engaged with the enemy there: it was no longer possible to recall it. The second, which was destined for Africa under the command of the consul Tiberius Sempronius, was fortunately still in Sicily: in this instance Roman delay for once proved useful. Of the two Carthaginian squadrons destined for Italy and Sicily, the first was dispersed by a storm, and some of its vessels were captured by the Syracusans near Messina; the second had endeavoured in vain to surprise Lilybaeum, and had thereafter been defeated in a naval engagement off that port. But the continuance of the enemy's

Page 529

squadrons in the Italian waters was so inconvenient, that the consul determined, before crossing to Africa, to occupy the small islands around Sicily, and to drive away the Carthaginian fleet operating against Italy. The summer passed away in the conquest of Melita, in the chase after the enemy's squadron, which he expected to find at the Lipari islands while it had made a descent near Vibo (Monteleone) and pillaged the Bruttian coast, and, lastly, in gaining information as to a suitable spot for landing on the coast of Africa; so that the army and fleet were still at Lilybaeum, when orders arrived from the senate that they should return with all possible speed for the defence of their homes.

In this way, while the two great Roman armies, each in itself equal in numbers to that of Hannibal, remained at a great distance from the valley of the Po, the Romans were quite unprepared for an attack in that quarter. No doubt a Roman army was there, in consequence of an insurrection that had broken out among the Celts even before the arrival of the Carthaginian army. The founding of the two Roman strongholds of Placentia and Cremona, each of which received 6000 colonists, and more especially the preparations for the founding of Mutina in the territory of the Boii, had already in the spring of 536 driven the Boii to revolt before the time concerted with Hannibal; and the Insubres had immediately joined them. The colonists already settled in the territory of Mutina, suddenly attacked, took refuge in the town. The praetor Lucius Manlius, who held the chief command at Ariminum, hastened with his single legion to relieve the blockaded colonists; but he was surprised in the woods, and no course was left to him after sustaining great loss but to establish himself upon a hill and to submit to a siege there on the part of the Boii, till a second legion sent from Rome under the praetor Lucius Atilius succeeded in relieving army and town, and in suppressing for the moment the Gaulish insurrection. This premature rising of the Boii on the one hand, by delaying the departure of Scipio for Spain, essentially promoted the plans of Hannibal; on the other hand, but for its occurrence he would have found the valley of the Po entirely unoccupied, except the fortresses. But the Roman corps, whose two severely thinned legions did not number 20,000 soldiers, had enough to do to keep the Celts in check, and did not think of occupying the passes of the Alps. The Romans only learned that the passes were threatened, when in August the consul Publius Scipio returned without his army from Massilia to Italy, and perhaps even then they gave little heed to the matter, because, forsooth, the foolhardy attempt would be frustrated by the Alps alone. Thus at the decisive hour and on the decisive spot there was not even a Roman outpost. Hannibal had full time to rest his army, to capture after a three days' siege the capital of the Taurini which closed its gates against him, and to induce or terrify into alliance with him all the Ligurian and Celtic communities in the upper basin of the Po, before Scipio, who had taken the command in the Po valley, encountered him.

Page 530

Scipio in the Valley of the Po
Conflict on the Ticino
The Armies at Placentia

Scipio, who, with an army considerably smaller and very weak in cavalry, had the difficult task of preventing the advance of the superior force of the enemy and of repressing the movements of insurrection which everywhere were spreading among the Celts, had crossed the Po presumably at Placentia, and marched up the river to meet the enemy, while Hannibal after the capture of Turin marched downwards to relieve the Insubres and Boii. In the plain between the Ticino and the Sesia, not far from Vercelli, the Roman cavalry, which had advanced with the light infantry to make a reconnoissance in force, encountered the Punic cavalry sent out for the like purpose, both led by the generals in person. Scipio accepted battle when offered, notwithstanding the superiority of the enemy; but his light infantry, which was placed in front of the cavalry, dispersed before the charge of the heavy cavalry of the enemy, and while the latter engaged the masses of the Roman horsemen in front, the light Numidian cavalry, after having pushed aside the broken ranks of the enemy's infantry, took the Roman horsemen in flank and rear. This decided the combat. The loss of the Romans was very considerable. The consul himself, who made up as a soldier for his deficiencies as a general, received a dangerous wound, and owed his safety entirely to the devotion of his son of seventeen, who, courageously dashing into the ranks of the enemy, compelled his squadron to follow him and rescued his father. Scipio, enlightened by this combat as to the strength of the enemy, saw the error which he had committed in posting himself, with a weaker army, in the plain with his back to the river, and resolved to return to the right bank of the Po under the eyes of his antagonist. As the operations became contracted into a narrower space and his illusions regarding Roman invincibility departed, he recovered the use of his considerable military talents, which the adventurous boldness of his youthful opponent's plans had for a moment paralyzed. While Hannibal was preparing for a pitched battle, Scipio by a rapidly projected and steadily executed march succeeded in reaching the right bank of the river which in an evil hour he had abandoned, and broke down the bridge over the Po behind his army; the Roman detachment of 600 men charged to cover the process of destruction were, however, intercepted and made prisoners. But as the upper course of the river was in the hands of Hannibal, he could not be prevented from marching up the stream, crossing on a bridge of boats, and in a few days confronting the Roman army on the right bank. The latter had taken a position in the plain in front of Placentia; but the mutiny of a Celtic division in the Roman camp, and the Gallic insurrection breaking out afresh all around, compelled the consul to evacuate the plain and to post himself on the hills behind the Trebia.

Page 531

This was accomplished without notable loss, because the Numidian horsemen sent in pursuit lost their time in plundering, and setting fire to, the abandoned camp. In this strong position, with his left wing resting on the Apennines, his right on the Po and the fortress of Placentia, and covered in front by the Trebia—no inconsiderable stream at that season—Scipio was unable to save the rich stores of Clastidium (Casteggio) from which in this position he was cut off by the army of the enemy; nor was he able to avert the insurrectionary movement on the part of almost all the Gallic cantons, excepting the Cenomani who were friendly to Rome; but he completely checked the progress of Hannibal, and compelled him to pitch his camp opposite to that of the Romans. Moreover, the position taken up by Scipio, and the circumstance of the Cenomani threatening the borders of the Insubres, hindered the main body of the Gallic insurgents from directly joining the enemy, and gave to the second Roman army, which meanwhile had arrived at Ariminum from Lilybaeum, the opportunity of reaching Placentia through the midst of the insurgent country without material hindrance, and of uniting itself with the army of the Po.

Battle on the Trebia

Scipio had thus solved his difficult task completely and brilliantly. The Roman army, now close on 40,000 strong, and though not a match for its antagonist in cavalry, at least equal in infantry, had simply to remain in its existing position, in order to compel the enemy either to attempt in the winter season the passage of the river and an attack upon the camp, or to suspend his advance and to test the fickle temper of the Gauls by the burden of winter quarters. Clear, however, as this was, it was no less clear that it was now December, and that under the course proposed the victory might perhaps be gained by Rome, but would not be gained by the consul Tiberius Sempronius, who held the sole command in consequence of Scipio's wound, and whose year of office expired in a few months. Hannibal knew the man, and neglected no means of alluring him to fight. The Celtic villages that had remained faithful to the Romans were cruelly laid waste, and, when this brought on a conflict between the cavalry, Hannibal allowed his opponents to boast of the victory. Soon thereafter on a raw rainy day a general engagement came on, unlocked for by the Romans. From the earliest hour of the morning the Roman light troops had been skirmishing with the light cavalry of the enemy; the latter slowly retreated, and the Romans eagerly pursued it through the deeply swollen Trebia to follow up the advantage which they had gained. Suddenly the cavalry halted; the Roman vanguard found itself face to face with the army of Hannibal drawn up for battle on a field chosen by himself; it was lost, unless the main body should cross the stream with all speed to its support. Hungry, weary, and wet, the Romans came on and hastened to form in order of battle, the cavalry, as usual,

Page 532

on the wings, the infantry in the centre. The light troops, who formed the vanguard on both sides, began the combat: but the Romans had already almost exhausted their missiles against the cavalry, and immediately gave way. In like manner the cavalry gave way on the wings, hard pressed by the elephants in front, and outflanked right and left by the far more numerous Carthaginian horse. But the Roman infantry proved itself worthy of its name: at the beginning of the battle it fought with very decided superiority against the infantry of the enemy, and even when the repulse of the Roman horse allowed the enemy's cavalry and light-armed troops to turn their attacks against the Roman infantry, the latter, although ceasing to advance, obstinately maintained its ground. At this stage a select Carthaginian band of 1000 infantry, and as many horsemen, under the leadership of Mago, Hannibal's youngest brother, suddenly emerged from an ambush in the rear of the Roman army, and fell upon the densely entangled masses. The wings of the army and the rear ranks of the Roman centre were broken up and scattered by this attack, while the first division, 10,000 men strong, in compact array broke through the Carthaginian line, and made a passage for itself obliquely through the midst of the enemy, inflicting great loss on the opposing infantry and more especially on the Gallic insurgents. This brave body, pursued but feebly, thus reached Placentia. The remaining mass was for the most part slaughtered by the elephants and light troops of the enemy in attempting to cross the river: only part of the cavalry and some divisions of infantry were able, by wading through the river, to gain the camp whither the Carthaginians did not follow them, and thus they too reached Placentia.(1) Few battles confer more honour on the Roman soldier than this on the Trebia, and few at the same time furnish graver impeachment of the general in command; although the candid judge will not forget that a commandership in chief expiring on a definite day was an unmilitary institution, and that figs cannot be reaped from thistles. The victory came to be costly even to the victors. Although the loss in the battle fell chiefly on the Celtic insurgents, yet a multitude of the veteran soldiers of Hannibal died afterwards from diseases engendered by that raw and wet winter day, and all the elephants perished except one.

Hannibal Master of Northern Italy

The effect of this first victory of the invading army was, that the national insurrection now spread and assumed shape without hindrance throughout the Celtic territory. The remains of the Roman army of the Po threw themselves into the fortresses of Placentia and Cremona: completely cut off from home, they were obliged to procure their supplies by way of the river. The consul Tiberius Sempronius only escaped, as if by miracle, from being taken prisoner, when with a weak escort of cavalry he went to Rome on account

Page 533

of the elections. Hannibal, who would not hazard the health of his troops by further marches at that inclement season, bivouacked for the winter where he was; and, as a serious attempt on the larger fortresses would have led to no result, contented himself with annoying the enemy by attacks on the river port of Placentia and other minor Roman positions. He employed himself mainly in organizing the Gallic insurrection: more than 60,000 foot soldiers and 4000 horsemen from the Celts are said to have joined his army.

Military and Political Position of Hannibal

No extraordinary exertions were made in Rome for the campaign of 537. The senate thought, and not unreasonably, that, despite the lost battle, their position was by no means fraught with serious danger. Besides the coast garrisons, which were despatched to Sardinia, Sicily, and Tarentum, and the reinforcements which were sent to Spain, the two new consuls Gaius Flaminius and Gnaeus Servilius obtained only as many men as were necessary to restore the four legions to their full complement; additions were made to the strength of the cavalry alone. The consuls had to protect the northern frontier, and stationed themselves accordingly on the two highways which led from Rome to the north, the western of which at that time terminated at Arretium, and the eastern at Ariminum; Gaius Flaminius occupied the former, Gnaeus Servilius the latter. There they ordered the troops from the fortresses on the Po to join them, probably by water, and awaited the commencement of the favourable season, when they proposed to occupy in the defensive the passes of the Apennines, and then, taking up the offensive, to descend into the valley of the Po and effect a junction somewhere near Placentia. But Hannibal by no means intended to defend the valley of the Po. He knew Rome better perhaps than the Romans knew it themselves, and was very well aware how decidedly he was the weaker and continued to be so notwithstanding the brilliant battle on the Trebia; he knew too that his ultimate object, the humiliation of Rome, was not to be wrung from the unbending Roman pride either by terror or by surprise, but could only be gained by the actual subjugation of the haughty city. It was clearly apparent that the Italian federation was in political solidity and in military resources infinitely superior to an adversary, who received only precarious and irregular support from home, and who in Italy was dependent for primary aid solely on the vacillating and capricious nation of the Celts; and that the Phoenician foot soldier was, notwithstanding all the pains taken by Hannibal, far inferior in point of tactics to the legionary, had been completely proved by the defensive movements of Scipio and the brilliant retreat of the defeated infantry on the Trebia. From this conviction flowed the two fundamental principles which determined Hannibal's whole method of operations in Italy—viz., that the war should be carried on, in somewhat adventurous

Page 534

fashion, with constant changes in the plan and in the theatre of operations; and that its favourable issue could only be looked for as the result of political and not of military successes—of the gradual loosening and final breaking up of the Italian federation. That mode of carrying on the war was necessary, because the single element which Hannibal had to throw into the scale against so many disadvantages—his military genius—only told with its full weight, when he constantly foiled his opponents by unexpected combinations; he was undone, if the war became stationary. That aim was the aim dictated to him by right policy, because, mighty conqueror though he was in battle, he saw very clearly that on each occasion he vanquished the generals and not the city, and that after each new battle the Romans remained just as superior to the Carthaginians as he was personally superior to the Roman commanders. That Hannibal even at the height of his fortune never deceived himself on this point, is worthier of admiration than his most admired battles.

Hannibal Crosses the Apennines

It was these motives, and not the entreaties of the Gauls that he should spare their country—which would not have influenced him—that induced Hannibal now to forsake, as it were, his newly acquired basis of operations against Italy, and to transfer the scene of war to Italy itself. Before doing so he gave orders that all the prisoners should be brought before him. He ordered the Romans to be separated and loaded with chains as slaves—the statement that Hannibal put to death all the Romans capable of bearing arms, who here and elsewhere fell into his hands, is beyond doubt at least strongly exaggerated. On the other hand, all the Italian allies were released without ransom, and charged to report at home that Hannibal waged war not against Italy, but against Rome; that he promised to every Italian community the restoration of its ancient independence and its ancient boundaries; and that the deliverer was about to follow those whom he had set free, bringing release and revenge. In fact, when the winter ended, he started from the valley of the Po to search for a route through the difficult defiles of the Apennines. Gaius Flaminius, with the Etruscan army, was still for the moment at Arezzo, intending to move from that point towards Lucca in order to protect the vale of the Arno and the passes of the Apennines, so soon as the season should allow. But Hannibal anticipated him. The passage of the Apennines was accomplished without much difficulty, at a point as far west as possible or, in other words, as distant as possible from the enemy; but the marshy low grounds between the Serchio and the Arno were so flooded by the melting of the snow and the spring rains, that the army had to march four days in water, without finding any other dry spot for resting by night than was supplied by piling the baggage or by the sumpter animals that had fallen.

Page 535

The troops underwent unutterable sufferings, particularly the Gallic infantry, which marched behind the Carthaginians along tracks already rendered impassable: they murmured loudly and would undoubtedly have dispersed to a man, had not the Carthaginian cavalry under Mago, which brought up the rear, rendered flight impossible. The horses, assailed by a distemper in their hoofs, fell in heaps; various diseases decimated the soldiers; Hannibal himself lost an eye in consequence of ophthalmia.

Flaminius

But the object was attained. Hannibal encamped at Fiesole, while Gaius Flaminius was still waiting at Arezzo until the roads should become passable that he might blockade them. After the Roman defensive position had thus been turned, the best course for the consul, who might perhaps have been strong enough to defend the mountain passes but certainly was unable now to face Hannibal in the open field, would have been to wait till the second army, which had now become completely superfluous at Ariminum, should arrive. He himself, however, judged otherwise. He was a political party leader, raised to distinction by his efforts to limit the power of the senate; indignant at the government in consequence of the aristocratic intrigues concocted against him during his consulship; carried away, through a doubtless justifiable opposition to their beaten track of partisanship, into a scornful defiance of tradition and custom; intoxicated at once by blind love of the common people and equally bitter hatred of the party of the nobles; and, in addition to all this, possessed with the fixed idea that he was a military genius. His campaign against the Insubres of 531, which to unprejudiced judges only showed that good! soldiers often repair the errors of bad generals,(2) was regarded by him and by his adherents as an irrefragable proof that the Romans had only to put Gaius Flaminius at the head of the army in order to make a speedy end of Hannibal. Talk of this sort had procured for him his second consulship, and hopes of this sort had now brought to his camp so great a multitude of unarmed followers eager for spoil, that their number, according to the assurance of sober historians, exceeded that of the legionaries. Hannibal based his plan in part on this circumstance. So far from attacking him, he marched past him, and caused the country all around to be pillaged by the Celts who thoroughly understood plundering, and by his numerous cavalry. The complaints and indignation of the multitude which had to submit to be plundered under the eyes of the hero who had promised to enrich them, and the protestation of the enemy that they did not believe him possessed of either the power or the resolution to undertake anything before the arrival of his colleague, could not but induce such a man to display his genius for strategy, and to give a sharp lesson to his inconsiderate and haughty foe.

Battle on the Trasimene Lake

Page 536

No plan was ever more successful. In haste, the consul followed the line of march of the enemy, who passed by Arezzo and moved slowly through the rich valley of the Chiana towards Perugia. He overtook him in the district of Cortona, where Hannibal, accurately informed of his antagonist's march, had had full time to select his field of battle—a narrow defile between two steep mountain walls, closed at its outlet by a high hill, and at its entrance by the Trasimene lake. With the flower of his infantry he barred the outlet; the light troops and the cavalry placed themselves in concealment on either side. The Roman columns advanced without hesitation into the unoccupied pass; the thick morning mist concealed from them the position of the enemy. As the head of the Roman line approached the hill, Hannibal gave the signal for battle; the cavalry, advancing behind the heights, closed the entrance of the pass, and at the same time the mist rolling away revealed the Phoenician arms everywhere along the crests on the right and left. There was no battle; it was a mere rout. Those that remained outside of the defile were driven by the cavalry into the lake. The main body was annihilated in the pass itself almost without resistance, and most of them, including the consul himself, were cut down in the order of march. The head of the Roman column, formed of 6000 infantry, cut their way through the infantry of the enemy, and proved once more the irresistible might of the legions; but, cut off from the rest of the army and without knowledge of its fate, they marched on at random, were surrounded on the following day, on a hill which they had occupied, by a corps of Carthaginian cavalry, and—as the capitulation, which promised them a free retreat, was rejected by Hannibal—were all treated as prisoners of war. 15,000 Romans had fallen, and as many were captured; in other words, the army was annihilated. The slight Carthaginian loss—1500 men—again fell mainly upon the Gauls.(3) And, as if this were not enough, immediately after the battle on the Trasimene lake, the cavalry of the army of Ariminum under Gaius Centenius, 4000 strong, which Gnaeus Servilius had sent forward for the temporary support of his colleague while he himself advanced by slow marches, was likewise surrounded by the Phoenician army, and partly slain, partly made prisoners. All Etruria was lost, and Hannibal might without hindrance march on Rome. The Romans prepared themselves for the worst; they broke down the bridges over the Tiber, and nominated Quintus Fabius Maximus dictator to repair the walls and conduct the defence, for which an army of reserve was formed. At the same time two new legions were summoned under arms in the room of those annihilated, and the fleet, which might become of importance in the event of a siege, was put in order.

Hannibal on the East Coast
Reorganization of the Carthaginian Army

Page 537

But Hannibal was more farsighted than king Pyrrhus. He did not march on Rome; nor even against Gnaeus Servilius, an able general, who had with the help of the fortresses on the northern road preserved his army hitherto uninjured, and would perhaps have kept his antagonist at bay. Once more a movement occurred which was quite unexpected. Hannibal marched past the fortress of Spoletium, which he attempted in vain to surprise, through Umbria, fearfully devastated the territory of Picenum which was covered all over with Roman farmhouses, and halted on the shores of the Adriatic. The men and horses of his army had not yet recovered from the painful effects of their spring campaign; here he rested for a considerable time to allow his army to recruit its strength in a pleasant district and at a fine season of the year, and to reorganize his Libyan infantry after the Roman mode, the means for which were furnished to him by the mass of Roman arms among the spoil. From this point, moreover, he resumed his long-interrupted communication with his native land, sending his messages of victory by water to Carthage. At length, when his army was sufficiently restored and had been adequately exercised in the use of the new arms, he broke up and marched slowly along the coast into southern Italy.

War in Lower Italy Fabius

He had calculated correctly, when he chose this time for remodelling his infantry. The surprise of his antagonists, who were in constant expectation of an attack on the capital, allowed him at least four weeks of undisturbed leisure for the execution of the unprecedentedly bold experiment of changing completely his military system in the heart of a hostile country and with an army still comparatively small, and of attempting to oppose African legions to the invincible legions of Italy. But his hope that the confederacy would now begin to break up was not fulfilled. In this respect the Etruscans, who had carried on their last wars of independence mainly with Gallic mercenaries, were of less moment; the flower of the confederacy, particularly in a military point of view, consisted—next to the Latins—of the Sabellian communities, and with good reason Hannibal had now come into their neighbourhood. But one town after another closed its gates; not a single Italian community entered into alliance with the Phoenicians. This was a great, in fact an all-important, gain for the Romans. Nevertheless it was felt in the capital that it would be imprudent to put the fidelity of their allies to such a test, without a Roman army to keep the field. The dictator Quintus Fabius combined the two supplementary legions formed in Rome with the army of Ariminum, and when Hannibal marched past the Roman fortress of Luceria towards Arpi, the Roman standards appeared on his right flank at Aeca. Their leader, however, pursued a course different from that of his predecessors. Quintus Fabius was a man advanced in years, of a deliberation and firmness,

Page 538

which to not a few seemed procrastination and obstinacy. Zealous in his reverence for the good old times, for the political omnipotence of the senate, and for the command of the burgomasters, he looked to a methodical prosecution of the war as —next to sacrifices and prayers—the means of saving the state. A political antagonist of Gaius Flaminius, and summoned to the head of affairs in virtue of the reaction against his foolish war-demagogism, Fabius departed for the camp just as firmly resolved to avoid a pitched battle at any price, as his predecessor had been determined at any price to fight one; he was without doubt convinced that the first elements of strategy would forbid Hannibal to advance so long as the Roman army confronted him intact, and that accordingly it would not be difficult to weaken by petty conflicts and gradually to starve out the enemy's army, dependent as it was on foraging for its supplies.

March to Capua and Back to Apulia War in Apulia

Hannibal, well served by his spies in Rome and in the Roman army, immediately learned how matters stood, and, as usual, adjusted the plan of his campaign in accordance with the individual character of the opposing leader. Passing the Roman army, he marched over the Apennines into the heart of Italy towards Beneventum, took the open town of Telesia on the boundary between Samnium and Campania, and thence turned against Capua, which as the most important of all the Italian cities dependent on Rome, and the only one standing in some measure on a footing of equality with it, had for that very reason felt more severely than any other community the oppression of the Roman government. He had formed connections there, which led him to hope that the Campanians might revolt from the Roman alliance; but in this hope he was disappointed. So, retracing his steps, he took the road to Apulia. During all this march of the Carthaginian army the dictator had followed along the heights, and had condemned his soldiers to the melancholy task of looking on with arms in their hands, while the Numidian cavalry plundered the faithful allies far and wide, and the villages over all the plain rose in flames. At length he opened up to the exasperated Roman army the eagerly-coveted opportunity of attacking the enemy. When Hannibal had begun his retreat, Fabius intercepted his route near Casilinum (the modern Capua), by strongly garrisoning that town on the left bank of the Volturnus and occupying the heights that crowned the right bank with his main army, while a division of 4000 men encamped on the road itself that led along by the river. But Hannibal ordered his light-armed troops to climb the heights which rose immediately alongside of the road, and to drive before them a number of oxen with lighted faggots on their horns, so that it seemed as if the Carthaginian army were thus marching off during the night by torchlight. The Roman division, which barred the road, imagining that they were evaded

Page 539

and that further covering of the road was superfluous, marched by a side movement to the same heights. Along the road thus left free Hannibal then retreated with the bulk of his army, without encountering the enemy; next morning he without difficulty, but with severe loss to the Romans, disengaged and recalled his light troops. Hannibal then continued his march unopposed in a north-easterly direction; and by a widely-circuitous route, after traversing and laying under contribution the lands of the Hirpinians, Campanians, Samnites, Paelignians, and Frentanians without resistance, he arrived with rich booty and a full chest once more in the region of Luceria, just as the harvest there was about to begin. Nowhere in his extensive march had he met with active opposition, but nowhere had he found allies. Clearly perceiving that no course remained for him but to take up winter quarters in the open field, he began the difficult operation of collecting the winter supplies requisite for the army, by means of its own agency, from the fields of the enemy. For this purpose he had selected the broad and mostly flat district of northern Apulia, which furnished grain and grass in abundance, and which could be completely commanded by his excellent cavalry. An entrenched camp was constructed at Gerunium, twenty-five miles to the north of Luceria. Two-thirds of the army were daily despatched from it to bring in the stores, while Hannibal with the remainder took up a position to protect the camp and the detachments sent out.

Fabius and Minucius

The master of the horse, Marcus Minucius, who held temporary command in the Roman camp during the absence of the dictator, deemed this a suitable opportunity for approaching the enemy more closely, and formed a camp in the territory of the Larinates; where on the one hand by his mere presence he checked the sending out of detachments and thereby hindered the provisioning of the enemy's army, and on the other hand, in a series of successful conflicts in which his troops encountered isolated Phoenician divisions and even Hannibal himself, drove the enemy from their advanced positions and compelled them to concentrate themselves at Gerunium. On the news of these successes, which of course lost nothing in the telling, the storm broke, forth in the capital against Quintus Fabius. It was not altogether unwarranted. Prudent as it was on the part of Rome to abide by the defensive and to expect success mainly from the cutting off of the enemy's means of subsistence, there was yet something strange in a system of defence and of starving out, under which the enemy had laid waste all central Italy without opposition beneath the eyes of a Roman army of equal numbers, and had provisioned themselves sufficiently for the winter by an organized method of foraging on the greatest scale. Publius Scipio, when he commanded on the Po, had not adopted this view of a defensive attitude, and the attempt of his successor to imitate him at Casilinum had failed

Page 540

in such a way as to afford a copious fund of ridicule to the scoffers of the city. It was wonderful that the Italian communities had not wavered, when Hannibal so palpably showed them the superiority of the Phoenicians and the nullity of Roman aid; but how long could they be expected to bear the burden of a double war, and to allow themselves to be plundered under the very eyes of the Roman troops and of their own contingents? Finally, it could not be alleged that the condition of the Roman army compelled the general to adopt this mode of warfare. It was composed, as regarded its core, of the capable legions of Ariminum, and, by their side, of militia called out, most of whom were likewise accustomed to service; and, far from being discouraged by the last defeats, it was indignant at the but little honourable task which its general, "Hannibal's lackey," assigned to it, and it demanded with a loud voice to be led against the enemy. In the assemblies of the people the most violent invectives were directed against the obstinate old man. His political opponents, with the former praetor Gaius Terentius Varro at their head, laid hold of the quarrel—for the understanding of which we must not forget that the dictator was practically nominated by the senate, and the office was regarded as the palladium of the conservative party—and, in concert with the discontented soldiers and the possessors of the plundered estates, they carried an unconstitutional and absurd resolution of the people conferring the dictatorship, which was destined to obviate the evils of a divided command in times of danger, on Marcus Minucius,⁽⁴⁾ who had hitherto been the lieutenant of Quintus Fabius, in the same way as on Fabius himself. Thus the Roman army, after its hazardous division into two separate corps had just been appropriately obviated, was once more divided; and not only so, but the two sections were placed under leaders who notoriously followed quite opposite plans of war. Quintus Fabius of course adhered more than ever to his methodical inaction; Marcus Minucius, compelled to justify in the field of battle his title of dictator, made a hasty attack with inadequate forces, and would have been annihilated had not his colleague averted greater misfortune by the seasonable interposition of a fresh corps. This last turn of matters justified in some measure the system of passive resistance. But in reality Hannibal had completely attained in this campaign all that arms could attain: not a single material operation had been frustrated either by his impetuous or by his deliberate opponent; and his foraging, though not unattended with difficulty, had yet been in the main so successful that the army passed the winter without complaint in the camp at Gerunium. It was not the Cunctator that saved Rome, but the compact structure of its confederacy and, not less perhaps, the national hatred with which the Phoenician hero was regarded on the part of Occidentals.

Page 541

New War-like Preparations in Rome Paullus and Varro

Despite all its misfortunes, Roman pride stood no less unshaken than the Roman symmarchy. The donations which were offered by king Hiero of Syracuse and the Greek cities in Italy for the next campaign—the war affected the latter less severely than the other Italian allies of Rome, for they sent no contingents to the land army—were declined with thanks; the chieftains of Illyria were informed that they could not be allowed to neglect payment of their tribute; and even the king of Macedonia was once more summoned to surrender Demetrius of Pharos. The majority of the senate, notwithstanding the semblance of legitimation which recent events had given to the Fabian system of delay, had firmly resolved to depart from a mode of war that was slowly but certainly ruining the state; if the popular dictator had failed in his more energetic method of warfare, they laid the blame of the failure, and not without reason, on the fact that they had adopted a half-measure and had given him too few troops. This error they determined to avoid and to equip an army, such as Rome had never sent out before—eight legions, each raised a fifth above the normal strength, and a corresponding number of allies—enough to crush an opponent who was not half so strong. Besides this, a legion under the praetor Lucius Postumius was destined for the valley of the Po, in order, if possible, to draw off the Celts serving in the army of Hannibal to their homes. These resolutions were judicious; everything depended on their coming to an equally judicious decision respecting the supreme command. The stiff carriage of Quintus Fabius, and the attacks of the demagogues which it provoked, had rendered the dictatorship and the senate generally more unpopular than ever: amongst the people, not without the connivance of their leaders, the foolish report circulated that the senate was intentionally prolonging the war. As, therefore, the nomination of a dictator was not to be thought of, the senate attempted to procure the election of suitable consuls; but this only had the effect of thoroughly rousing suspicion and obstinacy. With difficulty the senate carried one of its candidates, Lucius Aemilius Paullus, who had with judgment conducted the Illyrian war in 535;(5) an immense majority of the citizens assigned to him as colleague the candidate of the popular party, Gaius Terentius Varro, an incapable man, who was known only by his bitter opposition to the senate and more especially as the main author of the proposal to elect Marcus Minucius co-dictator, and who was recommended to the multitude solely by his humble birth and his coarse effrontery.

Battle at Cannae

Page 542

While these preparations for the next campaign were being made in Rome, the war had already recommenced in Apulia. As soon as the season allowed him to leave his winter quarters, Hannibal, determining as usual the course of the war and assuming the offensive, set out from Gerunium in a southerly direction, and marching past Luceria crossed the Aufidus and took the citadel of Cannae (between Canosa and Barletta) which commanded the plain of Canusium, and had hitherto served the Romans as their chief magazine. The Roman army which, since Fabius had conformably to the constitution resigned his dictatorship in the middle of autumn, was now commanded by Gnaeus Servilius and Marcus Regulus, first as consuls then as proconsuls, had been unable to avert a loss which they could not but feel. On military as well as on political grounds, it became more than ever necessary to arrest the progress of Hannibal by a pitched battle. With definite orders to this effect from the senate, accordingly, the two new commanders-in-chief, Paullus and Varro, arrived in Apulia in the beginning of the summer of 538. With the four new legions and a corresponding contingent of Italians which they brought up, the Roman army rose to 80,000 infantry, half burgesses, half allies, and 6000 cavalry, of whom one-third were burgesses and two-thirds allies; whereas Hannibal's army numbered 10,000 cavalry, but only about 40,000 infantry. Hannibal wished nothing so much as a battle, not merely for the general reasons which we have explained above, but specially because the wide Apulian plain allowed him to develop the whole superiority of his cavalry, and because the providing supplies for his numerous army would soon, in spite of that excellent cavalry, be rendered very difficult by the proximity of an enemy twice as strong and resting on a chain of fortresses. The leaders of the Roman forces also had, as we have said, made up their minds on the general question of giving battle, and approached the enemy with that view; but the more sagacious of them saw the position of Hannibal, and were disposed accordingly to wait in the first instance and simply to station themselves in the vicinity of the enemy, so as to compel him to retire and accept battle on a ground less favourable to him. Hannibal encamped at Cannae on the right bank of the Aufidus. Paullus pitched his camp on both banks of the stream, so that the main force came to be stationed on the left bank, but a strong corps took up a position on the right immediately opposite to the enemy, in order to impede his supplies and perhaps also to threaten Cannae. Hannibal, to whom it was all-important to strike a speedy blow, crossed the stream with the bulk of his troops, and offered battle on the left bank, which Paullus did not accept. But such military pedantry was disapproved by the democratic consul—so much had been said about men taking the field not to stand guard, but to use their swords—and he gave orders

Page 543

accordingly to attack the enemy, wherever and whenever they found him. According to the old custom foolishly retained, the decisive voice in the council of war alternated between the commanders-in-chief day by day; it was necessary therefore on the following day to submit, and to let the hero of the pavement have his way. On the left bank, where the wide plain offered full scope to the superior cavalry of the enemy, certainly even he would not fight; but he determined to unite the whole Roman forces on the right bank, and there, taking up a position between the Carthaginian camp and Cannae and seriously threatening the latter, to offer battle. A division of 10,000 men was left behind in the principal Roman camp, charged to capture the Carthaginian encampment during the conflict and thus to intercept the retreat of the enemy's army across the river. The bulk of the Roman army, at early dawn on the 28th of August according to the unconnected, perhaps in tune according to the correct, calendar, crossed the river which at this season was shallow and did not materially hamper the movements of the troops, and took up a position in line near the smaller Roman camp to the westward of Cannae. The Carthaginian army followed and likewise crossed the stream, on which rested the right Roman as well as the left Carthaginian wing. The Roman cavalry was stationed on the wings: the weaker portion consisting of burgesses, led by Paullus, on the right next the river; the stronger consisting of the allies, led by Varro, on the left towards the plain. In the centre was stationed the infantry in unusually deep files, under the command of the consul of the previous year Gnaeus Servilius. Opposite to this centre Hannibal arranged his infantry in the form of a crescent, so that the Celtic and Iberian troops in their national armour formed the advanced centre, and the Libyans, armed after the Roman fashion, formed the drawn-back wings on either side. On the side next the river the whole heavy cavalry under Hasdrubal was stationed, on the side towards the plain the light Numidian horse. After a short skirmish between the light troops the whole line was soon engaged. Where the light cavalry of the Carthaginians fought against the heavy cavalry of Varro, the conflict was prolonged, amidst constant charges of the Numidians, without decisive result. In the centre, on the other hand, the legions completely overthrew the Spanish and Gallic troops that first encountered them; eagerly the victors pressed on and followed up their advantage. But meanwhile, on the right wing, fortune had turned against the Romans. Hannibal had merely sought to occupy the left cavalry wing of the enemy, that he might bring Hasdrubal with the whole regular cavalry to bear against the weaker right and to overthrow it first. After a brave resistance, the Roman horse gave way, and those that were not cut down were chased up the river and scattered in the plain; Paullus, wounded, rode to the centre

Page 544

to turn or, if not, to share the fate of the legions. These, in order the better to follow up the victory over the advanced infantry of the enemy, had changed their front disposition into a column of attack, which, in the shape of a wedge, penetrated the enemy's centre. In this position they were warmly assailed on both sides by the Libyan infantry wheeling inward upon them right and left, and a portion of them were compelled to halt in order to defend themselves against the flank attack; by this means their advance was checked, and the mass of infantry, which was already too closely crowded, now had no longer room to develop itself at all. Meanwhile Hasdrubal, after having completed the defeat of the wing of Paullus, had collected and arranged his cavalry anew and led them behind the enemy's centre against the wing of Varro. His Italian cavalry, already sufficiently occupied with the Numidians, was rapidly scattered before the double attack, and Hasdrubal, leaving the pursuit of the fugitives to the Numidians, arranged his squadrons for the third time, to lead them against the rear of the Roman infantry. This last charge proved decisive. Flight was not possible, and quarter was not given. Never, perhaps, was an army of such size annihilated on the field of battle so completely, and with so little loss to its antagonist, as was the Roman army at Cannae. Hannibal had lost not quite 6000 men, and two-thirds of that loss fell upon the Celts, who sustained the first shock of the legions. On the other hand, of the 76,000 Romans who had taken their places in the line of battle 70,000 covered the field, amongst whom were the consul Lucius Paullus, the proconsul Gnaeus Servilius, two-thirds of the staff-officers, and eighty men of senatorial rank. The consul Gaius Varro was saved solely by his quick resolution and his good steed, reached Venusia, and was not ashamed to survive. The garrison also of the Roman camp, 10,000 strong, were for the most part made prisoners of war; only a few thousand men, partly of these troops, partly of the line, escaped to Canusium. Nay, as if in this year an end was to be made with Rome altogether, before its close the legion sent to Gaul fell into an ambush, and was, with its general Lucius Postumius who was nominated as consul for the next year, totally destroyed by the Gauls.

Consequences of the Battle of Cannae Prevention of Reinforcements from Spain

This unexampled success appeared at length to mature the great political combination, for the sake of which Hannibal had come to Italy. He had, no doubt, based his plan primarily upon his army; but with accurate knowledge of the power opposed to him he designed that army to be merely the vanguard, in support of which the powers of the west and east were gradually to unite their forces, so as to prepare destruction for the proud city. That support however, which seemed the most secure, namely the sending of reinforcements

Page 545

from Spain, had been frustrated by the boldness and firmness of the Roman general sent thither, Gnaeus Scipio. After Hannibal's passage of the Rhone Scipio had sailed for Emporiae, and had made himself master first of the coast between the Pyrenees and the Ebro, and then, after conquering Hanno, of the interior also (536). In the following year (537) he had completely defeated the Carthaginian fleet at the mouth of the Ebro, and after his brother Publius, the brave defender of the valley of the Po, had joined him with a reinforcement of 8000 men, he had even crossed the Ebro, and advanced as far as Saguntum. Hasdrubal had indeed in the succeeding year (538), after obtaining reinforcements from Africa, made an attempt in accordance with his brother's orders to conduct an army over the Pyrenees; but the Scipios opposed his passage of the Ebro, and totally defeated him, nearly at the same time that Hannibal conquered at Cannae. The powerful tribe of the Celtiberians and numerous other Spanish tribes had joined the Scipios; they commanded the sea, the passes of the Pyrenees, and, by means of the trusty Massiliots, the Gallic coast also. Now therefore support to Hannibal was less than ever to be looked for from Spain.

Reinforcements from Spain

On the part of Carthage as much had hitherto been done in support of her general in Italy as could be expected. Phoenician squadrons threatened the coasts of Italy and of the Roman islands and guarded Africa from a Roman landing, and there the matter ended. More substantial assistance was prevented not so much by the uncertainty as to where Hannibal was to be found and the want of a port of disembarkation in Italy, as by the fact that for many years the Spanish army had been accustomed to be self-sustaining, and above all by the murmurs of the peace party. Hannibal severely felt the consequences of this unpardonable inaction; in spite of all his saving of his money and of the soldiers whom he had brought with him, his chests were gradually emptied, the pay fell into arrear, and the ranks of his veterans began to thin. But now the news of the victory of Cannae reduced even the factious opposition at home to silence. The Carthaginian senate resolved to place at the disposal of the general considerable assistance in money and men, partly from Africa, partly from Spain, including 4000 Numidian horse and 40 elephants, and to prosecute the war with energy in Spain as well as in Italy.

Alliance between Carthage and Macedonia

The long-discussed offensive alliance between Carthage and Macedonia had been delayed, first by the sudden death of Antigonos, and then by the indecision of his successor Philip and the unseasonable war waged by him and his Hellenic allies against the Aetolians (534-537). It was only now, after the battle of Cannae, that Demetrius of Pharos found Philip disposed to listen to his proposal to cede to Macedonia his Illyrian possessions—which it was necessary, no doubt, to wrest in the

first place from the Romans—and it was only now that the court of Pella came to terms with Carthage. Macedonia undertook to land an invading army on the east coast of Italy, in return for which she received an assurance that the Roman possessions in Epirus should be restored to her.

Page 546

Alliance between Carthage and Syracuse

In Sicily king Hiero had during the years of peace maintained a policy of neutrality, so far as he could do so with safety, and he had shown a disposition to accommodate the Carthaginians during the perilous crises after the peace with Rome, particularly by sending supplies of corn. There is no doubt that he saw with the utmost regret a renewed breach between Carthage and Rome; but he had no power to avert it, and when it occurred he adhered with well-calculated fidelity to Rome. But soon afterwards (in the autumn of 538) death removed the old man after a reign of fifty-four years. The grandson and successor of the prudent veteran, the young and incapable Hieronymus, entered at once into negotiations with the Carthaginian diplomatists; and, as they made no difficulty in consenting to secure to him by treaty, first, Sicily as far as the old Carthagino-Sicilian frontier, and then, when he rose in the arrogance of his demands, the possession even of the whole island, he entered into alliance with Carthage, and ordered the Syracusan fleet to unite with the Carthaginian which had come to threaten Syracuse. The position of the Roman fleet at Lilybaeum, which already had to deal with a second Carthaginian squadron stationed near the Aegates, became all at once very critical, while at the same time the force that was in readiness at Rome for embarkation to Sicily had, in consequence of the defeat at Cannae, to be diverted to other and more urgent objects.

Capua and Most of the Communities of Lower Italy Pass over to Hannibal

Above all came the decisive fact, that now at length the fabric of the Roman confederacy began to be unhinged, after it had survived unshaken the shocks of two severe years of war. There passed over to the side of Hannibal Arpi in Apulia, and Ugentum in Messapia, two old towns which had been greatly injured by the Roman colonies of Luceria and Brundisium; all the towns of the Bruttii—who took the lead—with the exception of the Petelini and the Consentini who had to be besieged before yielding; the greater portion of the Lucanians; the Picentes transplanted into the region of Salernum; the Hirpini; the Samnites with the exception of the Pentri; lastly and chiefly, Capua the second city of Italy, which was able to bring into the field 30,000 infantry and 4000 horse, and whose secession determined that of the neighbouring towns Atella and Caiatia. The aristocratic party, indeed, attached by many ties to the interest of Rome everywhere, and more especially in Capua, very earnestly opposed this change of sides, and the obstinate internal conflicts which arose regarding it diminished not a little the advantage which Hannibal derived from these accessions. He found himself obliged, for instance, to have one of the leaders of the aristocratic party in Capua, Decius Magius, who even after the entrance of the Phoenicians obstinately contended for the Roman alliance, seized and conveyed to Carthage;

Page 547

thus furnishing a demonstration, very inconvenient for himself, of the small value of the liberty and sovereignty which had just been solemnly assured to the Campanians by the Carthaginian general. On the other hand, the south Italian Greeks adhered to the Roman alliance—a result to which the Roman garrisons no doubt contributed, but which was still more due to the very decided dislike of the Hellenes towards the Phoenicians themselves and towards their new Lucanian and Bruttian allies, and their attachment on the other hand to Rome, which had zealously embraced every opportunity of manifesting its Hellenism, and had exhibited towards the Greeks in Italy an unwonted gentleness. Thus the Campanian Greeks, particularly Neapolis, courageously withstood the attack of Hannibal in person: in Magna Graecia Rhegium, Thurii, Metapontum, and Tarentum did the same notwithstanding their very perilous position. Croton and Locri on the other hand were partly carried by storm, partly forced to capitulate, by the united Phoenicians and Bruttians; and the citizens of Croton were conducted to Locri, while Bruttian colonists occupied that important naval station. The Latin colonies in southern Italy, such as Brundisium, Venusia, Paesturn, Cosa, and Cales, of course maintained unshaken fidelity to Rome. They were the strongholds by which the conquerors held in check a foreign land, settled on the soil of the surrounding population, and at feud with their neighbours; they, too, would be the first to be affected, if Hannibal should keep his word and restore to every Italian community its ancient boundaries. This was likewise the case with all central Italy, the earliest seat of the Roman rule, where Latin manners and language already everywhere preponderated, and the people felt themselves to be the comrades rather than the subjects of their rulers. The opponents of Hannibal in the Carthaginian senate did not fail to appeal to the fact that not one Roman citizen or one Latin community had cast itself into the arms of Carthage. This groundwork of the Roman power could only be broken up, like the Cyclopean walls, stone by stone.

Attitude of the Romans

Such were the consequences of the day of Cannae, in which the flower of the soldiers and officers of the confederacy, a seventh of the whole number of Italians capable of bearing arms, perished. It was a cruel but righteous punishment for the grave political errors with which not merely some foolish or miserable individuals, but the Roman people themselves, were justly chargeable. A constitution adapted for a small country town was no longer suitable for a great power; it was simply impossible that the question as to the leadership of the armies of the city in such a war should be left year after year to be decided by the Pandora's box of the balloting-urn. As a fundamental revision of the constitution, if practicable at all, could not at least be undertaken now, the practical superintendence of the war, and

Page 548

in particular the bestowal and prolongation of the command, should have been at once left to the only authority which was in a position to undertake it—the senate—and there should have been reserved for the comitia the mere formality of confirmation. The brilliant successes of the Scipios in the difficult arena of Spanish warfare showed what might in this way be achieved. But political demagogism, which was already gnawing at the aristocratic foundations of the constitution, had seized on the management of the Italian war. The absurd accusation, that the nobles were conspiring with the enemy without, had made an impression on the “people.” The saviours to whom political superstition looked for deliverance, Gaius Flaminius and Gaius Varro, both “new men” and friends of the people of the purest dye, had accordingly been empowered by the multitude itself to execute the plans of operations which, amidst the approbation of that multitude, they had unfolded in the Forum; and the results were the battles on the Trasimene lake and at Cannae. Duty required that the senate, which now of course understood its task better than when it recalled half the army of Regulus from Africa, should take into its hands the management of affairs, and should oppose such mischievous proceedings; but when the first of those two defeats had for the moment placed the rudder in its hands, it too had hardly acted in a manner unbiassed by the interests of party. Little as Quintus Fabius may be compared with these Roman Cleons, he had yet conducted the war not as a mere military leader, but had adhered to his rigid attitude of defence specially as the political opponent of Gaius Flaminius; and in the treatment of the quarrel with his subordinate, had done what he could to exasperate at a time when unity was needed. The consequence was, first, that the most important instrument which the wisdom of their ancestors had placed in the hands of the senate just for such cases—the dictatorship—broke down in his hands; and, secondly—at least indirectly—the battle of Cannae. But the headlong fall of the Roman power was owing not to the fault of Quintus Fabius or Gaius Varro, but to the distrust between the government and the governed—to the variance between the senate and the burgesses. If the deliverance and revival of the state were still possible, the work had to begin at home with the re-establishment of unity and of confidence. To have perceived this and, what is of more importance, to have done it, and done it with an abstinence from all recriminations however just, constitutes the glorious and imperishable honour of the Roman senate. When Varro—alone of all the generals who had command in the battle—returned to Rome, and the Roman senators met him at the gate and thanked him that he had not despaired of the salvation of his country, this was no empty phraseology veiling the disaster under sounding words, nor was it bitter mockery over a poor wretch; it was the conclusion

Page 549

of peace between the government and the governed. In presence of the gravity of the time and the gravity of such an appeal, the chattering of demagogues was silent; henceforth the only thought of the Romans was how they might be able jointly to avert the common peril. Quintus Fabius, whose tenacious courage at this decisive moment was of more service to the state than all his feats of war, and the other senators of note took the lead in every movement, and restored to the citizens confidence in themselves and in the future. The senate preserved its firm and unbending attitude, while messengers from all sides hastened to Rome to report the loss of battles, the secession of allies, the capture of posts and magazines, and to ask reinforcements for the valley of the Po and for Sicily at a time when Italy was abandoned and Rome was almost without a garrison. Assemblages of the multitude at the gates were forbidden; onlookers and women were sent to their houses; the time of mourning for the fallen was restricted to thirty days that the service of the gods of joy, from which those clad in mourning attire were excluded, might not be too long interrupted—for so great was the number of the fallen, that there was scarcely a family which had not to lament its dead. Meanwhile the remnant saved from the field of battle had been assembled by two able military tribunes, Appius Claudius and Publius Scipio the younger, at Canusium. The latter managed, by his lofty spirit and by the brandished swords of his faithful comrades, to change the views of those genteel young lords who, in indolent despair of the salvation of their country, were thinking of escape beyond the sea. The consul Gaius Varro joined them with a handful of men; about two legions were gradually collected there; the senate gave orders that they should be reorganized and reduced to serve in disgrace and without pay. The incapable general was on a suitable pretext recalled to Rome; the praetor Marcus Claudius Marcellus, experienced in the Gallic wars, who had been destined to depart for Sicily with the fleet from Ostia, assumed the chief command. The utmost exertions were made to organize an army capable of taking the field. The Latins were summoned to render aid in the common peril. Rome itself set the example, and called to arms all the men above boyhood, armed the debtor-serfs and criminals, and even incorporated in the army eight thousand slaves purchased by the state. As there was a want of arms, they took the old spoils from the temples, and everywhere set the workshops and artisans in action. The senate was completed, not as timid patriots urged, from the Latins, but from the Roman burgesses who had the best title. Hannibal offered a release of captives at the expense of the Roman treasury; it was declined, and the Carthaginian envoy who had arrived with the deputation of captives was not admitted into the city: nothing should look as if the senate thought of peace. Not only were the allies to be prevented from believing that Rome was disposed to enter into negotiations, but even the meanest citizen was to be made to understand that for him as for all there was no peace, and that safety lay only in victory.

Page 550

Notes for Chapter V

1. Polybius's account of the battle on the Trebia is quite clear. If Placentia lay on the right bank of the Trebia where it falls into the Po, and if the battle was fought on the left bank, while the Roman encampment was pitched upon the right—both of which points have been disputed, but are nevertheless indisputable—the Roman soldiers must certainly have passed the Trebia in order to gain Placentia as well as to gain the camp. But those who crossed to the camp must have made their way through the disorganized portions of their own army and through the corps of the enemy that had gone round to their rear, and must then have crossed the river almost in hand-to-hand combat with the enemy. On the other hand the passage near Placentia was accomplished after the pursuit had slackened; the corps was several miles distant from the field of battle, and had arrived within reach of a Roman fortress; it may even have been the case, although it cannot be proved, that a bridge led over the Trebia at that point, and that the -tete de pont- on the other bank was occupied by the garrison of Placentia. It is evident that the first passage was just as difficult as the second was easy, and therefore with good reason Polybius, military judge as he was, merely says of the corps of 10,000, that in close columns it cut its way to Placentia (iii. 74, 6), without mentioning the passage of the river which in this case was unattended with difficulty.

The erroneousness of the view of Livy, which transfers the Phoenician camp to the right, the Roman to the left bank of the Trebia, has lately been repeatedly pointed out. We may only further mention, that the site of Clastidium, near the modern Casteggio, has now been established by inscriptions (Orelli-Henzen, 5117).

2. III. III. The Celts Attacked in Their Own Land

3. The date of the battle, 23rd June according to the uncorrected calendar, must, according to the rectified calendar, fall somewhere in April, since Quintus Fabius resigned his dictatorship, after six months, in the middle of autumn (Lav. xxii. 31, 7; 32, i), and must therefore have entered upon it about the beginning of May. The confusion of the calendar (p. 117) in Rome was even at this period very great.

4. The inscription of the gift devoted by the new dictator on account of his victory at Gerunium to Hercules Victor— -Hercolei sacrom M. Minuci(us) C. f. dictator vovit- — was found in the year 1862 at Rome, near S. Lorenzo.

5. III. III. Northern Italy

CHAPTER VI

The War under Hannibal from Cannae to Zama

The Crisis

Page 551

The aim of Hannibal in his expedition to Italy had been to break up the Italian confederacy: after three campaigns that aim had been attained, so far as it was at all attainable. It was clear that the Greek and Latin or Latinized communities of Italy, since they had not been shaken in their allegiance by the day of Cannae, would not yield to terror, but only to force; and the desperate courage with which even in Southern Italy isolated little country towns, such as the Bruttian Petelia, maintained their forlorn defence against the Phoenicians, showed very plainly what awaited them among the Marsians and Latins. If Hannibal had expected to accomplish more in this way and to be able to lead even the Latins against Rome, these hopes had proved vain. But it appears as if even in other respects the Italian coalition had by no means produced the results which Hannibal hoped for. Capua had at once stipulated that Hannibal should not have the right to call Campanian citizens compulsorily to arms; the citizens had not forgotten how Pyrrhus had acted in Tarentum, and they foolishly imagined that they should be able to withdraw at once from the Roman and from the Phoenician rule. Samnium and Luceria were no longer what they had been, when king Pyrrhus had thought of marching into Rome at the head of the Sabellian youth.

Not only did the chain of Roman fortresses everywhere cut the nerves and sinews of the land, but the Roman rule, continued for many years, had rendered the inhabitants unused to arms—they furnished only a moderate contingent to the Roman armies—had appeased their ancient hatred, and had gained over a number of individuals everywhere to the interest of the ruling community. They joined the conqueror of the Romans, indeed, after the cause of Rome seemed fairly lost, but they felt that the question was no longer one of liberty; it was simply the exchange of an Italian for a Phoenician master, and it was not enthusiasm, but despair that threw the Sabellian communities into the arms of the victor. Under such circumstances the war in Italy flagged. Hannibal, who commanded the southern part of the peninsula as far up as the Volturnus and Garganus, and who could not simply abandon these lands again as he had abandoned that of the Celts, had now likewise a frontier to protect, which could not be left uncovered with impunity; and for the purpose of defending the districts that he had gained against the fortresses which everywhere defied him and the armies advancing from the north, and at the same time of resuming the difficult offensive against central Italy, his forces—an army of about 40,000 men, without reckoning the Italian contingents—were far from sufficient.

Marcellus

Page 552

Above all, he found that other antagonists were opposed to him. Taught by fearful experience, the Romans adopted a more judicious system of conducting the war, placed none but experienced officers at the head of their armies, and left them, at least where it was necessary, for a longer period in command. These generals neither looked down on the enemy's movements from the mountains, nor did they throw themselves on their adversary wherever they found him; but, keeping the true mean between inaction and precipitation, they took up their positions in entrenched camps under the walls of fortresses, and accepted battle where victory would lead to results and defeat would not be destruction. The soul of this new mode of warfare was Marcus Claudius Marcellus. With true instinct, after the disastrous day of Cannae, the senate and people had turned their eyes to this brave and experienced officer, and entrusted him at once with the actual supreme command. He had received his training in the troublesome warfare against Hamilcar in Sicily, and had given brilliant evidence of his talents as a leader as well as of his personal valour in the last campaigns against the Celts. Although far above fifty, he still glowed with all the ardour of the most youthful soldier, and only a few years before this he had, as general, cut down the mounted general of the enemy(1)—the first and only Roman consul who achieved that feat of arms. His life was consecrated to the two divinities, to whom he erected the splendid double temple at the Capene Gate—to Honour and to Valour; and, while the merit of rescuing Rome from this extremity of danger belonged to no single individual, but pertained to the Roman citizens collectively and pre-eminently to the senate, yet no single man contributed more towards the success of the common enterprise than Marcus Marcellus.

Hannibal Proceeds to Campania

From the field of battle Hannibal had turned his steps to Campania, He knew Rome better than the simpletons, who in ancient and modern times have fancied that he might have terminated the struggle by a march on the enemy's capital. Modern warfare, it is true, decides a war on the field of battle; but in ancient times, when the system of attacking fortresses was far less developed than the system of defence, the most complete success in the field was on numberless occasions neutralized by the resistance of the walls of the capitals. The council and citizens of Carthage were not at all to be compared to the senate and people of Rome; the peril of Carthage after the first campaign of Regulus was infinitely more urgent than that of Rome after the battle of Cannae; yet Carthage had made a stand and been completely victorious. With what colour could it be expected that Rome would now deliver her keys to the victor, or even accept an equitable peace? Instead therefore of sacrificing practicable and important successes for the sake of such empty demonstrations, or losing time in the besieging

Page 553

of the two thousand Roman fugitives enclosed within the walls of Canusium, Hannibal had immediately proceeded to Capua before the Romans could throw in a garrison, and by his advance had induced this second city of Italy after long hesitation to join him. He might hope that, in possession of Capua, he would be able to seize one of the Campanian ports, where he might disembark the reinforcements which his great victories had wrung from the opposition at home.

Renewal of the War in Campania The War in Apulia

When the Romans learned whither Hannibal had gone, they also left Apulia, where only a weak division was retained, and collected their remaining forces on the right bank of the Volturnus. With the two legions saved from Cannae Marcus Marcellus marched to Teanum Sidicinum, where he was joined by such troops as were at the moment disposable from Rome and Ostia, and advanced—while the dictator Marcus Junius slowly followed with the main army which had been hastily formed—as far as the Volturnus at Casilinum, with a view if possible to save Capua. That city he found already in the power of the enemy; but on the other hand the attempts of the enemy on Neapolis had been thwarted by the courageous resistance of the citizens, and the Romans were still in good time to throw a garrison into that important port. With equal fidelity the two other large coast towns, Cumae and Nuceria, adhered to Rome. In Nola the struggle between the popular and senatorial parties as to whether they should attach themselves to the Carthaginians or to the Romans, was still undecided. Informed that the former were gaining the superiority, Marcellus crossed the river at Caiatia, and marching along the heights of Suessula so as to evade the enemy's army, he reached Nola in sufficient time to hold it against the foes without and within. In a sally he even repulsed Hannibal in person with considerable loss; a success which, as the first defeat sustained by Hannibal, was of far more importance from its moral effect than from its material results. In Campania indeed, Nuceria, Acerrae, and, after an obstinate siege prolonged into the following year (539), Casilinum also, the key of the Volturnus, were conquered by Hannibal, and the severest punishments were inflicted on the senates of these towns which had adhered to Rome. But terror is a bad weapon of proselytism; the Romans succeeded, with comparatively trifling loss, in surmounting the perilous moment of their first weakness. The war in Campania came to a standstill; then winter came on, and Hannibal took up his quarters in Capua, the luxury of which was by no means fraught with benefit to his troops who for three years had not been under a roof. In the next year (539) the war acquired another aspect. The tried general Marcus Marcellus, Tiberius Sempronius Gracchus who had distinguished himself in the campaign of the previous year as master of the horse to the dictator, and the veteran Quintus Fabius Maximus, took—Marcellus

Page 554

as proconsul, the two others as consuls—the command of the three Roman armies which were destined to surround Capua and Hannibal; Marcellus resting on Nola and Suessula, Maximus taking a position on the right bank of the Volturnus near Cales, and Gracchus on the coast near Liternum, covering Neapolis and Cumae. The Campanians, who marched to Hamae three miles from Cumae with a view to surprise the Cumaeans, were thoroughly defeated by Gracchus; Hannibal, who had appeared before Cumae to wipe out the stain, was himself worsted in a combat, and when the pitched battle offered by him was declined, retreated in ill humour to Capua. While the Romans in Campania thus not only maintained what they possessed, but also recovered Compteria and other smaller places, loud complaints were heard from the eastern allies of Hannibal. A Roman army under the praetor Marcus Valerius had taken position at Luceria, partly that it might, in connection with the Roman fleet, watch the east coast and the movements of the Macedonians; partly that it might, in connection with the army of Nola, levy contributions on the revolted Samnites, Lucanians, and Hirpini. To give relief to these, Hannibal turned first against his most active opponent, Marcus Marcellus; but the latter achieved under the walls of Nola no inconsiderable victory over the Phoenician army, and it was obliged to depart, without having cleared off the stain, from Campania for Arpi, in order at length to check the progress of the enemy's army in Apulia. Tiberius Gracchus followed it with his corps, while the two other Roman armies in Campania made arrangements to proceed next spring to the attack of Capua.

Hannibal Reduced to the Defensive His Prospects as to Reinforcements

The clear vision of Hannibal had not been dazzled by his victories. It became every day more evident that he was not thus gaining his object. Those rapid marches, that adventurous shifting of the war to and fro, to which Hannibal was mainly indebted for his successes, were at an end; the enemy had become wiser; further enterprises were rendered almost impossible by the inevitable necessity of defending what had been gained. The offensive was not to be thought of; the defensive was difficult, and threatened every year to become more so. He could not conceal from himself that the second half of his great task, the subjugation of the Latins and the conquest of Rome, could not be accomplished with his own forces and those of his Italian allies alone. Its accomplishment depended on the council at Carthage, on the head-quarters at Cartagena, on the courts of Pella and of Syracuse. If all the energies of Africa, Spain, Sicily, and Macedonia should now be exerted in common against the common enemy; if Lower Italy should become the great rendezvous for the armies and fleets of the west, south, and east; he might hope successfully to finish what the vanguard under his leadership had so brilliantly begun. The most natural and easy

Page 555

course would have been to send to him adequate support from home; and the Carthaginian state, which had remained almost untouched by the war and had been brought from deep decline so near to complete victory by a small band of resolute patriots acting of their own accord and at their own risk, could beyond doubt have done this. That it would have been possible for a Phoenician fleet of any desired strength to effect a landing at Locri or Croton, especially as long as the port of Syracuse remained open to the Carthaginians and the fleet at Brundisium was kept in check by Macedonia, is shown by the unopposed disembarkation at Locri of 4000 Africans, whom Bomilcar about this time brought over from Carthage to Hannibal, and still more by Hannibal's undisturbed embarkation, when all had been already lost. But after the first impression of the victory of Cannae had died away, the peace party in Carthage, which was at all times ready to purchase the downfall of its political opponents at the expense of its country, and which found faithful allies in the shortsightedness and indolence of the citizens, refused the entreaties of the general for more decided support with the half-simple, half-malicious reply, that he in fact needed no help inasmuch as he was really victor; and thus contributed not much less than the Roman senate to save Rome. Hannibal, reared in the camp and a stranger to the machinery of civic factions, found no popular leader on whose support he could rely, such as his father had found in Hasdrubal; and he was obliged to seek abroad the means of saving his native country—means which itself possessed in rich abundance at home.

For this purpose he might, at least with more prospect of success, reckon on the leaders of the Spanish patriot army, on the connections which he had formed in Syracuse, and on the intervention of Philip. Everything depended on bringing new forces into the Italian field of war against Rome from Spain, Syracuse, or Macedonia; and for the attainment or for the prevention of this object wars were carried on in Spain, Sicily, and Greece. All of these were but means to an end, and historians have often erred in accounting them of greater importance. So far as the Romans were concerned, they were essentially defensive wars, the proper objects of which were to hold the passes of the Pyrenees, to detain the Macedonian army in Greece, to defend Messina and to bar the communication between Italy and Sicily. Of course this defensive warfare was, wherever it was possible, waged by offensive methods; and, should circumstances be favourable, it might develop into the dislodging of the Phoenicians from Spain and Sicily, and into the dissolution of Hannibal's alliances with Syracuse and with Philip. The Italian war in itself fell for the time being into the shade, and resolved itself into conflicts about fortresses and razzias, which had no decisive effect on the main issue. Nevertheless, so long as the Phoenicians retained the offensive at all, Italy always remained the central aim of operations; and all efforts were directed towards, as all interest centred in, the doing away, or perpetuating, of Hannibal's isolation in southern Italy.

Page 556

The Sending of Reinforcements Temporarily Frustrated

Had it been possible, immediately after the battle of Cannae, to bring into play all the resources on which Hannibal thought that he might reckon, he might have been tolerably certain of success. But the position of Hasdrubal at that time in Spain after the battle on the Ebro was so critical, that the supplies of money and men, which the victory of Cannae had roused the Carthaginian citizens to furnish, were for the most part expended on Spain, without producing much improvement in the position of affairs there. The Scipios transferred the theatre of war in the following campaign (539) from the Ebro to the Guadalquivir; and in Andalusia, in the very centre of the proper Carthaginian territory, they achieved at Illiturgi and Intibili two brilliant victories. In Sardinia communications entered into with the natives led the Carthaginians to hope that they should be able to master the island, which would have been of importance as an intermediate station between Spain and Italy. But Titus Manlius Torquatus, who was sent with a Roman army to Sardinia, completely destroyed the Carthaginian landing force, and reassured to the Romans the undisputed possession of the island (539). The legions from Cannae sent to Sicily held their ground in the north and east of the island with courage and success against the Carthaginians and Hieronymus; the latter met his death towards the end of 539 by the hand of an assassin. Even in the case of Macedonia the ratification of the alliance was delayed, principally because the Macedonian envoys sent to Hannibal were captured on their homeward journey by the Roman vessels of war. Thus the dreaded invasion of the east coast was temporarily suspended; and the Romans gained time to secure the very important station of Brundisium first by their fleet and then by the land army which before the arrival of Gracchus was employed for the protection of Apulia, and even to make preparations for an invasion of Macedonia in the event of war being declared. While in Italy the war thus came to a stand, out of Italy nothing was done on the part of Carthage to accelerate the movement of new armies or fleets towards the seat of war. The Romans, again, had everywhere with the greatest energy put themselves in a state of defence, and in that defensive attitude had fought for the most part with good results wherever the genius of Hannibal was absent. Thereupon the short-lived patriotism, which the victory of Cannae had awakened in Carthage, evaporated; the not inconsiderable forces which had been organized there were, either through factious opposition or merely through unskilful attempts to conciliate the different opinions expressed in the council, so frittered away that they were nowhere of any real service, and but a very small portion arrived at the spot where they would have been most useful. At the close of 539 the reflecting Roman statesman might assure himself that the urgency of the danger was past, and that the resistance so heroically begun had but to persevere in its exertions at all points in order to achieve its object.

Page 557

War in Sicily Siege of Syracuse

First of all the war in Sicily came to an end. It had formed no part of Hannibal's original plan to excite a war on the island; but partly through accident, chiefly through the boyish vanity of the imprudent Hieronymus, a land war had broken out there, which—doubtless because Hannibal had not planned it—the Carthaginian council look up with especial zeal. After Hieronymus was killed at the close of 539, it seemed more than doubtful whether the citizens would persevere in the policy which he had pursued. If any city had reason to adhere to Rome, that city was Syracuse; for the victory of the Carthaginians over the Romans could not but give to the former, at any rate, the sovereignty of all Sicily, and no one could seriously believe that the promises made by Carthage to the Syracusans would be really kept. Partly induced by this consideration, partly terrified by the threatening preparations of the Romans—who made every effort to bring once more under their complete control that important island, the bridge between Italy and Africa, and now for the campaign of 540 sent their best general, Marcus Marcellus, to Sicily—the Syracusan citizens showed a disposition to obtain oblivion of the past by a timely return to the Roman alliance. But, amidst the dreadful confusion in the city—which after the death of Hieronymus was agitated alternately by endeavours to re-establish the ancient freedom of the people and by the -coups de main- of the numerous pretenders to the vacant throne, while the captains of the foreign mercenary troops were the real masters of the place—Hannibal's dexterous emissaries, Hippocrates and Epicydes, found opportunity to frustrate the projects of peace. They stirred up the multitude in the name of liberty; descriptions, exaggerated beyond measure, of the fearful punishment that the Romans were said to have inflicted on the Leontines, who had just been re-conquered, awakened doubts even among the better portion of the citizens whether it was not too late to restore their old relations with Rome; while the numerous Roman deserters among the mercenaries, mostly runaway rowers from the fleet, were easily persuaded that a peace on the part of the citizens with Rome would be their death-warrant. So the chief magistrates were put to death, the armistice was broken, and Hippocrates and Epicydes undertook the government of the city. No course was left to the consul except to undertake a siege; but the skilful conduct of the defence, in which the Syracusan engineer Archimedes, celebrated as a learned mathematician, especially distinguished himself, compelled the Romans after besieging the city for eight months to convert the siege into a blockade by sea and land.

Carthaginian Expedition to Sicily The Carthaginian Troops Destroyed Conquest of Syracuse

Page 558

In the meanwhile Carthage, which hitherto had only supported the Syracusans with her fleets, on receiving news of their renewed rising in arms against the Romans had despatched a strong land army under Himilco to Sicily, which landed without interruption at Heraclea Minoa and immediately occupied the important town of Agrigentum. To effect a junction with Himilco, the bold and able Hippocrates marched forth from Syracuse with an army: the position of Marcellus between the garrison of Syracuse and the two hostile armies began to be critical. With the help of some reinforcements, however, which arrived from Italy, he maintained his position in the island and continued the blockade of Syracuse. On the other hand, the greater portion of the small inland towns were driven to the armies of the Carthaginians not so much by the armies of the enemy, as by the fearful severity of the Roman proceedings in the island, more especially the slaughter of the citizens of Enna, suspected of a design to revolt, by the Roman garrison which was stationed there. In 542 the besiegers of Syracuse during a festival in the city succeeded in scaling a portion of the extensive outer walls that had been deserted by the guard, and in penetrating into the suburbs which stretched from the "island" and the city proper on the shore (Achradina) towards the interior. The fortress of Euryalus, which, situated at the extreme western end of the suburbs, protected these and the principal road leading from the interior to Syracuse, was thus cut off and fell not long afterwards. When the siege of the city thus began to assume a turn favourable to the Romans, the two armies under Himilco and Hippocrates advanced to its relief, and attempted a simultaneous attack on the Roman positions, combined with an attempt at landing on the part of the Carthaginian fleet and a sally of the Syracusan garrison; but the attack was repulsed on all sides, and the two relieving armies were obliged to content themselves with encamping before the city, in the low marshy grounds along the Anapus, which in the height of summer and autumn engender pestilences fatal to those that tarry in them. These pestilences had often saved the city, oftener even than the valour of its citizens; in the times of the first Dionysius, two Phoenician armies in the act of besieging the city had been in this way destroyed under its very walls. Now fate turned the special defence of the city into the means of its destruction; while the army of Marcellus quartered in the suburbs suffered but little, fevers desolated the Phoenician and Syracusan bivouacs. Hippocrates died; Himilco and most of the Africans died also; the survivors of the two armies, mostly native Siceli, dispersed into the neighbouring cities. The Carthaginians made a further attempt to save the city from the sea side; but the admiral Bomilcar withdrew, when the Roman fleet offered him battle. Epicydes himself, who commanded in the city, now abandoned it as lost,

Page 559

and made his escape to Agrigentum. Syracuse would gladly have surrendered to the Romans; negotiations had already begun. But for the second time they were thwarted by the deserters: in another mutiny of the soldiers the chief magistrates and a number of respectable citizens were slain, and the government and the defence of the city were entrusted by the foreign troops to their captains. Marcellus now entered into a negotiation with one of these, which gave into his hands one of the two portions of the city that were still free, the "island"; upon which the citizens voluntarily opened to him the gates of Achradina also (in the autumn of 542). If mercy was to be shown in any case, it might, even according to the far from laudable principles of Roman public law as to the treatment of perfidious communities, have been extended to this city, which manifestly had not been at liberty to act for itself, and which had repeatedly made the most earnest attempts to get rid of the tyranny of the foreign soldiers. Nevertheless, not only did Marcellus stain his military honour by permitting a general pillage of the wealthy mercantile city, in the course of which Archimedes and many other citizens were put to death, but the Roman senate lent a deaf ear to the complaints which the Syracusans afterwards presented regarding the celebrated general, and neither returned to individuals their pillaged property nor restored to the city its freedom. Syracuse and the towns that had been previously dependent on it were classed among the communities tributary to Rome—Tauromenium and Neetum alone obtained the same privileges as Messana, while the territory of Leontini became Roman domain and its former proprietors Roman lessees—and no Syracusan citizen was henceforth allowed to reside in the "island," the portion of the city that commanded the harbour.

Guerilla War in Sicily
Agrigentum Occupied by the Romans
Sicily Tranquillized

Sicily thus appeared lost to the Carthaginians; but the genius of Hannibal exercised even from a distance its influence there. He despatched to the Carthaginian army, which remained at Agrigentum in perplexity and inaction under Hanno and Epicydes, a Libyan cavalry officer Muttines, who took the command of the Numidian cavalry, and with his flying squadrons, fanning into an open flame the bitter hatred which the despotic rule of the Romans had excited over all the island, commenced a guerilla warfare on the most extensive scale and with the happiest results; so that he even, when the Carthaginian and Roman armies met on the river Himera, sustained some conflicts with Marcellus himself successfully. The relations, however, which prevailed between Hannibal and the Carthaginian council, were here repeated on a small scale. The general appointed by the council pursued with jealous envy the officer sent by Hannibal, and insisted upon giving battle to the proconsul without Muttines and the Numidians. The wish of Hanno was carried

Page 560

out, and he was completely beaten. Muttines was not induced to deviate from his course; he maintained himself in the interior of the country, occupied several small towns, and was enabled by the not inconsiderable reinforcements which joined him from Carthage gradually to extend his operations. His successes were so brilliant, that at length the commander-in-chief, who could not otherwise prevent the cavalry officer from eclipsing him, deprived him summarily of the command of the light cavalry, and entrusted it to his own son. The Numidian, who had now for two years preserved the island for his Phoenician masters, had the measure of his patience exhausted by this treatment. He and his horsemen who refused to follow the younger Hanno entered into negotiations with the Roman general Marcus Valerius Laevinus and delivered to him Agrigentum. Hanno escaped in a boat, and went to Carthage to report to his superiors the disgraceful high treason of Hannibal's officer; the Phoenician garrison in the town was put to death by the Romans, and the citizens were sold into slavery (544). To secure the island from such surprises as the landing of 540, the city received a new body of inhabitants selected from Sicilians well disposed towards Rome; the old glorious Akragas was no more. After the whole of Sicily was thus subdued, the Romans exerted themselves to restore some sort of tranquillity and order to the distracted island. The pack of banditti that haunted the interior were driven together en masse and conveyed to Italy, that from their head-quarters at Rhegium they might burn and destroy in the territories of Hannibal's allies. The government did its utmost to promote the restoration of agriculture which had been totally neglected in the island. The Carthaginian council more than once talked of sending a fleet to Sicily and renewing the war there; but the project went no further.

Philip of Macedonia and His Delay

Macedonia might have exercised an influence over the course of events more decisive than that of Syracuse. From the Eastern powers neither furtherance nor hindrance was for the moment to be expected. Antiochus the Great, the natural ally of Philip, had, after the decisive victory of the Egyptians at Raphia in 537, to deem himself fortunate in obtaining peace from the indolent Philopator on the basis of the -status quo ante-. The rivalry of the Lagidae and the constant apprehension of a renewed outbreak of the war on the one hand, and insurrections of pretenders in the interior and enterprises of all sorts in Asia Minor, Bactria, and the eastern satrapies on the other, prevented him from joining that great anti-Roman alliance which Hannibal had in view. The Egyptian court was decidedly on the side of Rome, with which it renewed alliance in 544; but it was not to be expected of Ptolemy Philopator, that he would support otherwise than by cornships. Accordingly there was nothing to prevent Greece and Macedonia from throwing a decisive

Page 561

weight into the great Italian struggle except their own discord; they might save the Hellenic name, if they had the self-control to stand by each other for but a few years against the common foe. Such sentiments doubtless were current in Greece. The prophetic saying of Agelaus of Naupactus, that he was afraid that the prize-fights in which the Hellenes now indulged at home might soon be over; his earnest warning to direct their eyes to the west, and not to allow a stronger power to impose on all the parties now contending a peace of equal servitude—such sayings had essentially contributed to bring about the peace between Philip and the Aetolians (537), and it was a significant proof of the tendency of that peace that the Aetolian league immediately nominated Agelaus as its -strategus-.

National patriotism was bestirring itself in Greece as in Carthage: for a moment it seemed possible to kindle a Hellenic national war against Rome. But the general in such a crusade could only be Philip of Macedonia; and he lacked the enthusiasm and the faith in the nation, without which such a war could not be waged. He knew not how to solve the arduous problem of transforming himself from the oppressor into the champion of Greece. His very delay in the conclusion of the alliance with Hannibal damped the first and best zeal of the Greek patriots; and when he did enter into the conflict with Rome, his mode of conducting war was still less fitted to awaken sympathy and confidence. His first attempt, which was made in the very year of the battle of Cannae (538), to obtain possession of the city of Apollonia, failed in a way almost ridiculous, for Philip turned back in all haste on receiving the totally groundless report that a Roman fleet was steering for the Adriatic. This took place before there was a formal breach with Rome; when the breach at length ensued, friend and foe expected a Macedonian landing in Lower Italy. Since 539 a Roman fleet and army had been stationed at Brundisium to meet it; Philip, who was without vessels of war, was constructing a flotilla of light Illyrian barks to convey his army across. But when the endeavour had to be made in earnest, his courage failed to encounter the dreaded quinqueremes at sea; he broke the promise which he had given to his ally Hannibal to attempt a landing, and with the view of still doing something he resolved to make an attack on his own share of the spoil, the Roman possessions in Epirus (540). Nothing would have come of this even at the best; but the Romans, who well knew that offensive was preferable to defensive protection, were by no means content to remain—as Philip may have hoped—spectators of the attack from the opposite shore. The Roman fleet conveyed a division of the army from Brundisium to Epirus; Oricum was recaptured from the king, a garrison was thrown into Apollonia, and the Macedonian camp was stormed. Thereupon Philip passed from partial action to total inaction, and notwithstanding all the complaints of Hannibal, who vainly tried to breathe into such a halting and shortsighted policy his own fire and clearness of decision, he allowed some years to elapse in armed inactivity.

Page 562

Rome Heads a Greek Coalition against Macedonia

Nor was Philip the first to renew the hostilities. The fall of Tarentum (542), by which Hannibal acquired an excellent port on the coast which was the most convenient for the landing of a Macedonian army, induced the Romans to parry the blow from a distance and to give the Macedonians so much employment at home that they could not think of an attempt on Italy. The national enthusiasm in Greece had of course evaporated long ago. With the help of the old antagonism to Macedonia, and of the fresh acts of imprudence and injustice of which Philip had been guilty, the Roman admiral Laevinus found no difficulty in organizing against Macedonia a coalition of the intermediate and minor powers under the protectorate of Rome. It was headed by the Aetolians, at whose diet Laevinus had personally appeared and had gained its support by a promise of the Acarnanian territory which the Aetolians had long coveted. They concluded with Rome a modest agreement to rob the other Greeks of men and land on the joint account, so that the land should belong to the Aetolians, the men and moveables to the Romans. They were joined by the states of anti-Macedonian, or rather primarily of anti-Achaean, tendencies in Greece proper; in Attica by Athens, in the Peloponnesus by Elis and Messene and especially by Sparta, the antiquated constitution of which had been just about this time overthrown by a daring soldier Machanidas, in order that he might himself exercise despotic power under the name of king Pelops, a minor, and might establish a government of adventurers sustained by bands of mercenaries. The coalition was joined moreover by those constant antagonists of Macedonia, the chieftains of the half-barbarous Thracian and Illyrian tribes, and lastly by Attalus king of Pergamus, who followed out his own interest with sagacity and energy amidst the ruin of the two great Greek states which surrounded him, and had the acuteness even now to attach himself as a client to Rome when his assistance was still of some value.

Resultless Warfare

Peace between Philip and the Greeks

Peace between Philip and Rome

It is neither agreeable nor necessary to follow the vicissitudes of this aimless struggle. Philip, although he was superior to each one of his opponents and repelled their attacks on all sides with energy and personal valour, yet consumed his time and strength in that profitless defensive. Now he had to turn against the Aetolians, who in concert with the Roman fleet annihilated the unfortunate Acarnanians and threatened Locris and Thessaly; now an invasion of barbarians summoned him to the northern provinces; now the Achaeans solicited his help against the predatory expeditions of Aetolians and Spartans; now king Attalus of Pergamus and the Roman admiral Publius Sulpicius with their combined fleets threatened the east coast or landed troops in Euboea. The want of a war fleet paralyzed Philip in all his movements; he even

Page 563

went so far as to beg vessels of war from his ally Prusias of Bithynia, and even from Hannibal. It was only towards the close of the war that he resolved—as he should have done at first—to order the construction of 100 ships of war; of these however no use was made, if the order was executed at all. All who understood the position of Greece and sympathized with it lamented the unhappy war, in which the last energies of Greece preyed upon themselves and the prosperity of the land was destroyed; repeatedly the commercial states, Rhodes, Chios, Mitylene, Byzantium, Athens, and even Egypt itself had attempted a mediation. In fact both parties had an interest in coming to terms. The Aetolians, to whom their Roman allies attached the chief importance, had, like the Macedonians, much to suffer from the war; especially after the petty king of the Athamanes had been gained by Philip, and the interior of Aetolia had thus been laid open to Macedonian incursions. Many Aetolians too had their eyes gradually opened to the dishonourable and pernicious part which the Roman alliance condemned them to play; a cry of horror pervaded the whole Greek nation when the Aetolians in concert with the Romans sold whole bodies of Hellenic citizens, such as those of Anticyra, Oreus, Dyme, and Aegina, into slavery. But the Aetolians were no longer free; they ran a great risk if of their own accord they concluded peace with Philip, and they found the Romans by no means disposed, especially after the favourable turn which matters were taking in Spain and in Italy, to desist from a war, which on their part was carried on with merely a few ships, and the burden and injury of which fell mainly on the Aetolians. At length however the Aetolians resolved to listen to the mediating cities: and, notwithstanding the counter-efforts of the Romans, a peace was arranged in the winter of 548-9 between the Greek powers. Aetolia had converted an over-powerful ally into a dangerous enemy; but the Roman senate, which just at that time was summoning all the resources of the exhausted state for the decisive expedition to Africa, did not deem it a fitting moment to resent the breach of the alliance. The war with Philip could not, after the withdrawal of the Aetolians, have been carried on by the Romans without considerable exertions of their own; and it appeared to them more convenient to terminate it also by a peace, whereby the state of things before the war was substantially restored and Rome in particular retained all her possessions on the coast of Epirus except the worthless territory of the Atintanes. Under the circumstances Philip had to deem himself fortunate in obtaining such terms; but the fact proclaimed—what could not indeed be longer concealed—that all the unspeakable misery which ten years of a warfare waged with revolting inhumanity had brought upon Greece had been endured in vain, and that the grand and just combination, which Hannibal had projected and all Greece had for a moment joined, was shattered irretrievably.

Page 564

Spanish War

In Spain, where the spirit of Hamilcar and Hannibal was powerful, the struggle was more earnest. Its progress was marked by the singular vicissitudes incidental to the peculiar nature of the country and the habits of the people. The farmers and shepherds, who inhabited the beautiful valley of the Ebro and the luxuriantly fertile Andalusia as well as the rough intervening highland region traversed by numerous wooded mountain ranges, could easily be assembled in arms as a general levy; but it was difficult to lead them against the enemy or even to keep them together at all. The towns could just as little be combined for steady and united action, obstinately as in each case they bade defiance to the oppressor behind their walls. They all appear to have made little distinction between the Romans and the Carthaginians; whether the troublesome guests who had established themselves in the valley of the Ebro, or those who had established themselves on the Guadalquivir, possessed a larger or smaller portion of the peninsula, was probably to the natives very much a matter of indifference; and for that reason the tenacity of partisanship so characteristic of Spain was but little prominent in this war, with isolated exceptions such as Saguntum on the Roman and Astapa on the Carthaginian side. But, as neither the Romans nor the Africans had brought with them sufficient forces of their own, the war necessarily became on both sides a struggle to gain partisans, which was decided rarely by solid attachment, more usually by fear, money, or accident, and which, when it seemed about to end, resolved itself into an endless series of fortress-sieges and guerilla conflicts, whence it soon revived with fresh fury. Armies appeared and disappeared like sandhills on the seashore; on the spot where a hill stood yesterday, not a trace of it remains today. In general the superiority was on the side of the Romans, partly because they at first appeared in Spain as the deliverers of the land from Phoenician despotism, partly because of the fortunate selection of their leaders and of the stronger nucleus of trustworthy troops which these brought along with them. It is hardly possible, however, with the very imperfect and—in point of chronology especially—very confused accounts which have been handed down to us, to give a satisfactory view of a war so conducted.

Successes of the Scipios Syphax against Carthage

The two lieutenant-governors of the Romans in the peninsula, Gnaeus and Publius Scipio—both of them, but especially Gnaeus, good generals and excellent administrators—accomplished their task with the most brilliant success. Not only was the barrier of the Pyrenees steadfastly maintained, and the attempt to re-establish the interrupted communication by land between the commander-in-chief of the enemy and his head-quarters sternly repulsed; not only had a Spanish New Rome been created, after the model of

Page 565

the Spanish New Carthage, by means of the comprehensive fortifications and harbour works of Tarraco, but the Roman armies had already in 539 fought with success in Andalusia.(2) Their expedition thither was repeated in the following year (540) with still greater success. The Romans carried their arms almost to the Pillars of Hercules, extended their protectorate in South Spain, and lastly by regaining and restoring Saguntum secured for themselves an important station on the line from the Ebro to Cartagena, repaying at the same time as far as possible an old debt which the nation owed. While the Scipios thus almost dislodged the Carthaginians from Spain, they knew how to raise up a dangerous enemy to them in western Africa itself in the person of the powerful west African prince Syphax, ruling in the modern provinces of Oran and Algiers, who entered into connections with the Romans (about 541). Had it been possible to supply him with a Roman army, great results might have been expected; but at that time not a man could be spared from Italy, and the Spanish army was too weak to be divided. Nevertheless the troops belonging to Syphax himself, trained and led by Roman officers, excited so serious a ferment among the Libyan subjects of Carthage that the lieutenant-commander of Spain and Africa, Hasdrubal Barcas, went in person to Africa with the flower of his Spanish troops. His arrival in all likelihood gave another turn to the matter; the king Gala—in what is now the province of Constantine—who had long been the rival of Syphax, declared for Carthage, and his brave son Massinissa defeated Syphax, and compelled him to make peace. Little more is related of this Libyan war than the story of the cruel vengeance which Carthage, according to her wont, inflicted on the rebels after the victory of Massinissa.

The Scipios Defeated and Killed
Spain South of the Ebro Lost to the Romans
Nero Sent to Spain

This turn of affairs in Africa had an important effect on the war in Spain. Hasdrubal was able once more to turn to that country (543), whither he was soon followed by considerable reinforcements and by Massinissa himself. The Scipios, who during the absence of the enemy's general (541, 542) had continued to plunder and to gain partisans in the Carthaginian territory, found themselves unexpectedly assailed by forces so superior that they were under the necessity of either retreating behind the Ebro or calling out the Spaniards. They chose the latter course, and took into their pay 20,000 Celtiberians; and then, in order the better to encounter the three armies of the enemy under Hasdrubal Barcas, Hasdrubal the son of Gisgo, and Mago, they divided their army and did not even keep their Roman troops together. They thus prepared the way for their own destruction. While Gnaeus with his corps, containing a third of the Roman and all the Spanish troops, lay encamped opposite to Hasdrubal Barcas, the latter had no difficulty

Page 566

in inducing the Spaniards in the Roman army by means of a sum of money to withdraw—which perhaps to their free-lance ideas of morals did not even seem a breach of fidelity, seeing that they did not pass over to the enemies of their paymaster. Nothing was left to the Roman general but hastily to begin his retreat, in which the enemy closely followed him. Meanwhile the second Roman corps under Publius found itself vigorously assailed by the two other Phoenician armies under Hasdrubal son of Gisgo and Mago, and the daring squadrons of Massinissa's horse gave to the Carthaginians a decided advantage. The Roman camp was almost surrounded; when the Spanish auxiliaries already on the way should arrive, the Romans would be completely hemmed in. The bold resolve of the proconsul to encounter with his best troops the advancing Spaniards, before their appearance should fill up the gap in the blockade, ended unfortunately. The Romans indeed had at first the advantage; but the Numidian horse, who were rapidly despatched in pursuit, soon overtook them and prevented them both from following up the victory which they had already half gained, and from marching back, until the Phoenician infantry came up and at length the fall of the general converted the lost battle into a defeat. After Publius had thus fallen, Gnaeus, who slowly retreating had with difficulty defended himself against the one Carthaginian army, found himself suddenly assailed at once by three, and all retreat cut off by the Numidian cavalry. Hemmed in upon a bare hill, which did not even afford the possibility of pitching a camp, the whole corps were cut down or taken prisoners. As to the fate of the general himself no certain information was ever obtained. A small division alone was conducted by Gaius Marcius, an excellent officer of the school of Gnaeus, in safety to the other bank of the Ebro; and thither the legate Titus Fonteius also succeeded in bringing safely the portion of the corps of Publius that had been left in the camp; most even of the Roman garrisons scattered in the south of Spain were enabled to flee thither. In all Spain south of the Ebro the Phoenicians ruled undisturbed; and the moment seemed not far distant, when the river would be crossed, the Pyrenees would be open, and the communication with Italy would be restored. But the emergency in the Roman camp called the right man to the command. The choice of the soldiers, passing over older and not incapable officers, summoned that Gaius Marcius to become leader of the army; and his dexterous management and quite as much perhaps, the envy and discord among the three Carthaginian generals, wrested from these the further fruits of their important victory. Such of the Carthaginians as had crossed the river were driven back, and the line of the Ebro was held in the meanwhile, till Rome gained time to send a new army and a new general. Fortunately the turn of the war in Italy, where Capua had just fallen, allowed this to be done.

Page 567

A strong legion—12,000 men—arriving under the propraetor Gaius Claudius Nero, restored the balance of arms. An expedition to Andalusia in the following year (544) was most successful; Hasdrubal Barcas was beset and surrounded, and escaped a capitulation only by ignoble stratagem and open perfidy. But Nero was not the right general for the Spanish war. He was an able officer, but a harsh, irritable, unpopular man, who had little skill in the art of renewing old connections or of forming new ones, or in taking advantage of the injustice and arrogance with which the Carthaginians after the death of the Scipios had treated friend and foe in Further Spain, and had exasperated all against them.

Publius Scipio

The senate, which formed a correct judgment as to the importance and the peculiar character of the Spanish war, and had learned from the Uticensis brought in as prisoners by the Roman fleet the great exertions which were making in Carthage to send Hasdrubal and Massinissa with a numerous army over the Pyrenees, resolved to despatch to Spain new reinforcements and an extraordinary general of higher rank, the nomination of whom they deemed it expedient to leave to the people. For long—so runs the story—nobody announced himself as ready to take in hand the complicated and perilous business; but at last a young officer of twenty-seven, Publius Scipio (son of the general of the same name that had fallen in Spain), who had held the offices of military tribune and aedile, came forward to solicit it. It is incredible that the Roman senate should have left to accident an election of such importance in this meeting of the Comitia which it had itself suggested, and equally incredible that ambition and patriotism should have so died out in Rome that no tried officer presented himself for the important post. If on the other hand the eyes of the senate turned to the young, talented, and experienced officer, who had brilliantly distinguished himself in the hotly-contested days on the Ticinus and at Cannae, but who still had not the rank requisite for his coming forward as the successor of men who had been praetors and consuls, it was very natural to adopt this course, which compelled the people out of good nature to admit the only candidate notwithstanding his defective qualification, and which could not but bring both him and the Spanish expedition, which was doubtless very unpopular, into favour with the multitude. If the effect of this ostensibly unpremeditated candidature was thus calculated, it was perfectly successful. The son, who went to avenge the death of a father whose life he had saved nine years before on the Ticinus; the young man of manly beauty and long locks, who with modest blushes offered himself in the absence of a better for the post of danger; the mere military tribune, whom the votes of the centuries now raised at once to the roll of the highest magistracies—all this made a wonderful and indelible impression on

Page 568

the citizens and farmers of Rome. And in truth Publius Scipio was one, who was himself enthusiastic, and who inspired enthusiasm. He was not one of the few who by their energy and iron will constrain the world to adopt and to move in new paths for centuries, or who at any rate grasp the reins of destiny for years till its wheels roll over them. Publius Scipio gained battles and conquered countries under the instructions of the senate; with the aid of his military laurels he took also a prominent position in Rome as a statesman; but a wide interval separates such a man from an Alexander or a Caesar. As an officer he rendered at least no greater service to his country than Marcus Marcellus; and as a politician, although not perhaps himself fully conscious of the unpatriotic and personal character of his policy, he injured his country at least as much, as he benefited it by his military skill. Yet a special charm lingers around the form of that graceful hero; it is surrounded, as with a dazzling halo, by the atmosphere of serene and confident inspiration, in which Scipio with mingled credulity and adroitness always moved. With quite enough of enthusiasm to warm men's hearts, and enough of calculation to follow in every case the dictates of intelligence, while not leaving out of account the vulgar; not naive enough to share the belief of the multitude in his divine inspirations, nor straightforward enough to set it aside, and yet in secret thoroughly persuaded that he was a man specially favoured of the gods—in a word, a genuine prophetic nature; raised above the people, and not less aloof from them; a man of steadfast word and kingly spirit, who thought that he would humble himself by adopting the ordinary title of a king, but could never understand how the constitution of the republic should in his case be binding; so confident in his own greatness that he knew nothing of envy or of hatred, courteously acknowledged other men's merits, and compassionately forgave other men's faults; an excellent officer and a refined diplomatist without the repellent special impress of either calling, uniting Hellenic culture with the fullest national feeling of a Roman, an accomplished speaker and of graceful manners—Publius Scipio won the hearts of soldiers and of women, of his countrymen and of the Spaniards, of his rivals in the senate and of his greater Carthaginian antagonist. His name was soon on every one's lips, and his was the star which seemed destined to bring victory and peace to his country.

Scipio Goes to Spain Capture of New Carthage

Publius Scipio went to Spain in 544-5, accompanied by the propraetor Marcus Silanus, who was to succeed Nero and to serve as assistant and counsellor to the young commander-in-chief, and by his intimate friend Gaius Laelius as admiral, and furnished with a legion exceeding the usual strength and a well-filled chest. His appearance on the scene was at once signalized by one of the boldest and most fortunate -coups de

Page 569

main- that are known in history. Of the three Carthaginian generals Hasdrubal Barcas was stationed at the sources, Hasdrubal son of Gisgo at the mouth, of the Tagus, and Mago at the Pillars of Hercules; the nearest of them was ten days' march from the Phoenician capital New Carthage. Suddenly in the spring of 545, before the enemy's armies began to move, Scipio set out with his whole army of nearly 30,000 men and the fleet for this town, which he could reach from the mouth of the Ebro by the coast route in a few days, and surprised the Phoenician garrison, not above 1000 men strong, by a combined attack by sea and land. The town, situated on a tongue of land projecting into the harbour, found itself threatened at once on three sides by the Roman fleet, and on the fourth by the legions; and all help was far distant. Nevertheless the commandant Mago defended himself with resolution and armed the citizens, as the soldiers did not suffice to man the walls. A sortie was attempted; but the Romans repelled it with ease and, without taking time to open a regular siege, began the assault on the landward side. Eagerly the assailants pushed their advance along the narrow land approach to the town; new columns constantly relieved those that were fatigued; the weak garrison was utterly exhausted; but the Romans had gained no advantage. Scipio had not expected any; the assault was merely designed to draw away the garrison from the side next to the harbour, where, having been informed that part of the latter was left dry at ebb-tide, he meditated a second attack. While the assault was raging on the landward side, Scipio sent a division with ladders over the shallow bank "where Neptune himself showed them the way," and they had actually the good fortune to find the walls at that point undefended. Thus the city was won on the first day; whereupon Mago in the citadel capitulated. With the Carthaginian capital there fell into the hands of the Romans 18 dismantled vessels of war and 63 transports, the whole war-stores, considerable supplies of corn, the war-chest of 600 talents (more than; 40,000 pounds), ten thousand captives, among whom were eighteen Carthaginian gerusiasts or judges, and the hostages of all the Spanish allies of Carthage. Scipio promised the hostages permission to return home so soon as their respective communities should have entered into alliance with Rome, and employed the resources which the city afforded to reinforce and improve the condition of his army. He ordered the artisans of New Carthage, 2000 in number, to work for the Roman army, promising to them liberty at the close of the war, and he selected the able-bodied men among the remaining multitude to serve as rowers in the fleet. But the burgesses of the city were spared, and allowed to retain their liberty and former position. Scipio knew the Phoenicians, and was aware that they would obey; and it was important that a city possessing the only excellent harbour on the east coast and rich silver mines should be secured by something more than a garrison.

Page 570

Success thus crowned the bold enterprise—bold, because it was not unknown to Scipio that Hasdrubal Barcas had received orders from his government to advance towards Gaul and was engaged in fulfilling them, and because the weak division left behind on the Ebro was not in a position seriously to oppose that movement, should the return of Scipio be delayed. But he was again at Tarraco, before Hasdrubal made his appearance on the Ebro. The hazard of the game which the young general played, when he abandoned his primary task in order to execute a dashing stroke, was concealed by the fabulous success which Neptune and Scipio had gained in concert. The marvellous capture of the Phoenician capital so abundantly justified all the expectations which had been formed at home regarding the wondrous youth, that none could venture to utter any adverse opinion. Scipio's command was indefinitely prolonged; he himself resolved no longer to confine his efforts to the meagre task of guarding the passes of the Pyrenees. Already, in consequence of the fall of New Carthage, not only had the Spaniards on the north of the Ebro completely submitted, but even beyond the Ebro the most powerful princes had exchanged the Carthaginian for the Roman protectorate.

Scipio Goes to Andalusia Hasdrubal Crosses the Pyrenees

Scipio employed the winter of 545-6 in breaking up his fleet and increasing his land army with the men thus acquired, so that he might at once guard the north and assume the offensive in the south more energetically than before; and he marched in 546 to Andalusia. There he encountered Hasdrubal Barcas, who, in the execution of his long-cherished plan, was moving northward to the help of his brother. A battle took place at Baecula, in which the Romans claimed the victory and professed to have made 10,000 captives; but Hasdrubal substantially attained his end, although at the sacrifice of a portion of his army. With his chest, his elephants, and the best portion of his troops, he fought his way to the north coast of Spain; marching along the shore, he reached the western passes of the Pyrenees which appear to have been unoccupied, and before the bad season began he was in Gaul, where he took up quarters for the winter. It was evident that the resolve of Scipio to combine offensive operations with the defensive which he had been instructed to maintain was inconsiderate and unwise. The immediate task assigned to the Spanish army, which not only Scipio's father and uncle, but even Gaius Marcius and Gaius Nero had accomplished with much inferior means, was not enough for the arrogance of the victorious general at the head of a numerous army; and he was mainly to blame for the extremely critical position of Rome in the summer of 547, when the plan of Hannibal for a combined attack on the Romans was at length realized. But the gods covered the errors of their favourite with laurels. In Italy the peril fortunately passed over; the Romans were glad to accept the bulletin of the ambiguous victory of Baecula, and, when fresh tidings of victory arrived from Spain, they thought no more of the circumstance that they had had to combat the ablest general and the flower of the Hispano-Phoenician army in Italy.

Page 571

Spain Conquered
Mago Goes to Italy
Gades Becomes Roman

After the removal of Hasdrubal Barcas the two generals who were left in Spain determined for the time being to retire, Hasdrubal son of Gisgo to Lusitania, Mago even to the Baleares; and, until new reinforcements should arrive from Africa, they left the light cavalry of Massinissa alone to wage a desultory warfare in Spain, as Muttines had done so successfully in Sicily. The whole east coast thus fell into the power of the Romans. In the following year (547) Hanno actually made his appearance from Africa with a third army, whereupon Mago and Hasdrubal returned to Andalusia. But Marcus Silanus defeated the united armies of Mago and Hanno, and captured the latter in person. Hasdrubal upon this abandoned the idea of keeping the open field, and distributed his troops among the Andalusian cities, of which Scipio was during this year able to storm only one, Oringis. The Phoenicians seemed vanquished; but yet they were able in the following year (548) once more to send into the field a powerful army, 32 elephants, 4000 horse, and 70,000 foot, far the greater part of whom, it is true, were hastily-collected: Spanish militia. Again a battle took place at Baecula. The Roman army numbered little more than half that of the enemy, and was also to a considerable extent composed of Spaniards. Scipio, like Wellington in similar circumstances, disposed his Spaniards so that they should not partake in the fight—the only possible mode of preventing their dispersion—while on the other hand he threw his Roman troops in the first instance on the Spaniards. The day was nevertheless obstinately contested; but at length the Romans were the victors, and, as a matter of course, the defeat of such an army was equivalent to its complete dissolution—Hasdrubal and Mago singly made their escape to Gades. The Romans were now without a rival in the peninsula; the few towns that did not submit with good will were subdued one by one, and some of them were punished with cruel severity. Scipio was even able to visit Syphax on the African coast, and to enter into communications with him and also with Massinissa with reference to an expedition to Africa—a foolhardy venture, which was not warranted by any corresponding advantage, however much the report of it might please the curiosity of the citizens of the capital at home. Gades alone, where Mago held command, was still Phoenician. For a moment it seemed as if, after the Romans had entered upon the Carthaginian heritage and had sufficiently undeceived the expectation cherished here and there among the Spaniards that after the close of the Phoenician rule they would get rid of their Roman guests also and regain their ancient freedom, a general insurrection against the Romans would break forth in Spain, in which the former allies of Rome would take the lead. The sickness of the Roman general and the mutiny of one of his corps, occasioned by their pay being in

Page 572

arrear for many years, favoured the rising. But Scipio recovered sooner than was expected, and dexterously suppressed the tumult among the soldiers; upon which the communities that had taken the lead in the national rising were subdued at once before the insurrection gained ground. Seeing that nothing came of this movement and Gades could not be permanently held, the Carthaginian government ordered Mago to gather together whatever could be got in ships, troops, and money, and with these, if possible, to give another turn to the war in Italy. Scipio could not prevent this—his dismantling of the fleet now avenged itself—and he was a second time obliged to leave in the hands of his gods the defence, with which he had been entrusted, of his country against new invasions. The last of Hamilcar's sons left the peninsula without opposition. After his departure Gades, the oldest and last possession of the Phoenicians on Spanish soil, submitted on favourable conditions to the new masters. Spain was, after a thirteen years' struggle, converted from a Carthaginian into a Roman province, in which the conflict with the Romans was still continued for centuries by means of insurrections always suppressed and yet never subdued, but in which at the moment no enemy stood opposed to Rome. Scipio embraced the first moment of apparent peace to resign his command (in the end of 548), and to report at Rome in person the victories which he had achieved and the provinces which he had won.

Italian War Position of the Armies

While the war was thus terminated in Sicily by Marcellus, in Greece by Publius Sulpicius, and in Spain by Scipio, the mighty struggle went on without interruption in the Italian peninsula. There after the battle of Cannae had been fought and its effects in loss or gain could by degrees be discerned, at the commencement of 540, the fifth year of the war, the dispositions of the opposing Romans and Phoenicians were the following. North Italy had been reoccupied by the Romans after the departure of Hannibal, and was protected by three legions, two of which were stationed in the Celtic territory, the third as a reserve in Picenum. Lower Italy, as far as Mount Garganus and the Volturnus, was, with the exception of the fortresses and most of the ports, in the hands of Hannibal. He lay with his main army at Arpi, while Tiberius Gracchus with four legions confronted him in Apulia, resting upon the fortresses of Luceria and Beneventum. In the land of the Bruttians, where the inhabitants had thrown themselves entirely into the arms of Hannibal, and where even the ports—excepting Rhegium, which the Romans protected from Messina—had been occupied by the Phoenicians, there was a second Carthaginian army under Hanno, which in the meanwhile saw no enemy to face it. The Roman main army of four legions under the two consuls, Quintus Fabius and Marcus Marcellus, was on the point of attempting to recover Capua. To these there fell to be

Page 573

added on the Roman side the reserve of two legions in the capital, the garrisons placed in all the seaports—Tarentum and Brundisium having been reinforced by a legion on account of the Macedonian landing apprehended there—and lastly the strong fleet which had undisputed command of the sea. If we add to these the Roman armies in Sicily, Sardinia, and Spain, the whole number of the Roman forces, even apart from the garrison service in the fortresses of Lower Italy which was provided for by the colonists occupying them, may be estimated at not less than 200,000 men, of whom one-third were newly enrolled for this year, and about one-half were Roman citizens. It may be assumed that all the men capable of service from the 17th to the 46th year were under arms, and that the fields, where the war permitted them to be tilled at all, were cultivated by the slaves and the old men, women, and children. As may well be conceived, under such circumstances the finances were in the most grievous embarrassment; the land-tax, the main source of revenue, came in but very irregularly. Yet notwithstanding these difficulties as to men and money the Romans were able—slowly indeed and by exerting all their energies, but still surely—to recover what they had so rapidly lost; to increase their armies yearly, while those of the Phoenicians were diminishing; to gain ground year by year on the Italian allies of Hannibal, the Campanians, Apulians, Samnites, and Bruttians, who neither sufficed, like the Roman fortresses in Lower Italy, for their own protection nor could be adequately protected by the weak army of Hannibal; and finally, by means of the method of warfare instituted by Marcus Marcellus, to develop the talent of their officers and to bring into full play the superiority of the Roman infantry. Hannibal might doubtless still hope for victories, but no longer such victories as those on the Trasimene lake and on the Aufidus; the times of the citizen-generals were gone by. No course was left to him but to wait till either Philip should execute his long-promised descent or his own brothers should join him from Spain, and meanwhile to keep himself, his army, and his clients as far as possible free from harm and in good humour. We hardly recognize in the obstinate defensive system which he now began the same general who had carried on the offensive with almost unequalled impetuosity and boldness; it is marvellous in a psychological as well as in a military point of view, that the same man should have accomplished the two tasks set to him—tasks so diametrically opposite in their character—with equal completeness.

Conflicts in the South of Italy

Page 574

At first the war turned chiefly towards Campania. Hannibal appeared in good time to protect its capital, which he prevented from being invested; but he was unable either to wrest any of the Campanian towns held by the Romans from their strong Roman garrisons, or to prevent—in addition to a number of less important country towns—Casilinum, which secured his passage over the Volturnus, from being taken by the two consular armies after an obstinate defence. An attempt of Hannibal to gain Tarentum, with the view especially of acquiring a safe landing-place for the Macedonian army, proved unsuccessful. Meanwhile the Bruttian army of the Carthaginians under Hanno had various encounters in Lucania with the Roman army of Apulia; here Tiberius Gracchus sustained the struggle with good results, and after a successful combat not far from Beneventum, in which the slave legions pressed into service had distinguished themselves, he bestowed liberty and burgess-rights on his slave-soldiers in the name of the people.

Arpi Acquired by the Romans

In the following year (541) the Romans recovered the rich and important Arpi, whose citizens, after the Roman soldiers had stolen into the town, made common cause with them against the Carthaginian garrison. In general the bonds of the symmachy formed by Hannibal were relaxing; a number of the leading Capuans and several of the Bruttian towns passed over to Rome; even a Spanish division of the Phoenician army, when informed by Spanish emissaries of the course of events in their native land, passed from the Carthaginian into the Roman service.

Tarentum Taken by Hannibal

The year 542 was more unfavourable for the Romans in consequence of fresh political and military errors, of which Hannibal did not fail to take advantage. The connections which Hannibal maintained in the towns of Magna Graecia had led to no serious result; save that the hostages from Tarentum and Thurii, who were kept at Rome, were induced by his emissaries to make a foolhardy attempt at escape, in which they were speedily recaptured by the Roman posts. But the injudicious spirit of revenge displayed by the Romans was of more service to Hannibal than his intrigues; the execution of all the hostages who had sought to escape deprived them of a valuable pledge, and the exasperated Greeks thenceforth meditated how they might open their gates to Hannibal. Tarentum was actually occupied by the Carthaginians in consequence of an understanding with the citizens and of the negligence of the Roman commandant; with difficulty the Roman garrison maintained itself in the citadel. The example of Tarentum was followed by Heraclea, Thurii, and Metapontum, from which town the garrison had to be withdrawn in order to save the Tarentine Acropolis. These successes so greatly increased the risk of a Macedonian landing, that Rome felt herself compelled to direct renewed attention and renewed exertions to the Greek war, which had been almost totally neglected; and fortunately the capture of Syracuse and the favourable state of the Spanish war enabled her to do so.

Page 575

Conflicts around Capua

At the chief seat of war, in Campania, the struggle went on with very varying success. The legions posted in the neighbourhood of Capua had not yet strictly invested the city, but had so greatly hindered the cultivation of the soil and the ingathering of the harvest, that the populous city was in urgent need of supplies from without. Hannibal accordingly collected a considerable supply of grain, and directed the Campanians to receive it at Beneventum; but their tardiness gave the consuls Quintus Flaccus and Appius Claudius time to come up, to inflict a severe defeat on Hanno who protected the grain, and to seize his camp and all his stores. The two consuls then invested the town, while Tiberius Gracchus stationed himself on the Appian Way to prevent Hannibal from approaching to relieve it. But that brave officer fell in consequence of the shameful stratagem of a perfidious Lucanian; and his death was equivalent to a complete defeat, for his army, consisting mostly of those slaves whom he had manumitted, dispersed after the fall of their beloved leader. So Hannibal found the road to Capua open, and by his unexpected appearance compelled the two consuls to raise the blockade which they had barely begun. Their cavalry had already, before Hannibal's arrival, been thoroughly defeated by the Phoenician cavalry, which lay as a garrison in Capua under Hanno and Bostar, and by the equally excellent Campanian horse. The total destruction of the regular troops and free bands in Lucania led by Marcus Centenius, a man imprudently promoted from a subaltern to be a general, and the not much less complete defeat of the negligent and arrogant praetor Gnaeus Fulvius Flaccus in Apulia, closed the long series of the misfortunes of this year. But the stubborn perseverance of the Romans again neutralized the rapid success of Hannibal, at least at the most decisive point. As soon as Hannibal turned his back on Capua to proceed to Apulia, the Roman armies once more gathered around that city, one at Puteoli and Volturnum under Appius Claudius, another at Casilinum under Quintus Fulvius, and a third on the Nolan road under the praetor Gaius Claudius Nero. The three camps, well entrenched and connected with one another by fortified lines, precluded all access to the place, and the large, inadequately provisioned city could not but find itself compelled by the mere investment to surrender at no distant time, should no relief arrive. As the winter of 542-3 drew to an end, the provisions were almost exhausted, and urgent messengers, who were barely able to steal through the well-guarded Roman lines, requested speedy help from Hannibal, who was at Tarentum, occupied with the siege of the citadel. With 33 elephants and his best troops he departed by forced marches from Tarentum for Campania, captured the Roman post at Caiatia, and took up his camp on Mount Tifata close by Capua, in the confident expectation that the Roman generals would, now raise

Page 576

the siege as they had done the year before. But the Romans, who had had time to entrench their camps and their lines like a fortress, did not stir, and looked on unmoved from their ramparts, while on one side the Campanian horsemen, on the other the Numidian squadrons, dashed against their lines. A serious assault could not be thought of by Hannibal; he could foresee that his advance would soon draw the other Roman armies after him to Campania, if even before their arrival the scarcity of supplies in a region so systematically foraged did not drive him away. Nothing could be done in that quarter.

Hannibal Marches toward Rome

Hannibal tried a further expedient, the last which occurred to his inventive genius, to save the important city. After giving the Campanians information of his intention and exhorting them to hold out, he started with the relieving army from Capua and took the road for Rome. With the same dexterous boldness which he had shown in his first Italian campaigns, he threw himself with a weak army between the armies and fortresses of the enemy, and led his troops through Samnium and along the Valerian Way past Tibur to the bridge over the Anio, which he passed and encamped on the opposite bank, five miles from the city. The children's children of the Romans still shuddered, when they were told of "Hannibal at the gate"; real danger there was none. The country houses and fields in the neighbourhood of the city were laid waste by the enemy; the two legions in the city, who went forth against them, prevented the investment of the walls. Besides, Hannibal had never expected to surprise Rome by a -coup de main-, such as Scipio soon afterwards executed against New Carthage, and still less had he meditated a siege in earnest; his only hope was that in the first alarm part of the besieging army of Capua would march to Rome and thus give him an opportunity of breaking up the blockade. Accordingly after a brief stay he departed. The Romans saw in his withdrawal a miraculous intervention of the gods, who by portents and visions had compelled the wicked man to depart, when in truth the Roman legions were unable to compel him; at the spot where Hannibal had approached nearest to the city, at the second milestone on the Appian Way in front of the Capene gate, with grateful credulity the Romans erected an altar to the god "who turned back and protected" (-Rediculus Tutanus-), Hannibal in reality retreated, because this was part of his plan, and directed his march towards Capua. But the Roman generals had not committed the mistake on which their opponent had reckoned; the legions remained unmoved in the lines round Capua, and only a weak corps had been detached on the news of Hannibal's march towards Rome. When Hannibal learned this, he suddenly turned against the consul Publius Galba, who had imprudently followed him from Rome, and with whom he had hitherto avoided an engagement, vanquished him, and took his camp by storm.

Page 577

Capua Capitulates

But this was a poor compensation for the now inevitable fall of Capua. Long had its citizens, particularly the better passes, anticipated with sorrowful forebodings what was coming; the senate-house and the administration of the city were left almost exclusively to the leaders of the popular party hostile to Rome. Now despair seized high and low, Campanians and Phoenicians alike. Twenty-eight senators chose a voluntary death; the remainder gave over the city to the discretion of an implacably exasperated foe. Of course a bloody retribution had to follow; the only discussion was as to whether the process should be long or short: whether the wiser and more appropriate course was to probe to the bottom the further ramifications of the treason even beyond Capua, or to terminate the matter by rapid executions. Appius Claudius and the Roman senate wished to take the former course; the latter view, perhaps the less inhuman, prevailed. Fifty-three of the officers and magistrates of Capua were scourged and beheaded in the marketplaces of Cales and Teanum by the orders and before the eyes of the proconsul Quintus Flaccus, the rest of the senators were imprisoned, numbers of the citizens were sold into slavery, and the estates of the more wealthy were confiscated. Similar penalties were inflicted upon Atella and Caiatia. These punishments were severe; but, when regard is had to the importance of the revolt of Capua from Rome, and to what was the ordinary if not warrantable usage of war in those times, they were not unnatural. And had not the citizens themselves pronounced their own sentence, when immediately after their defection they put to death all the Roman citizens present in Capua at the time of the revolt? But it was unjustifiable in Rome to embrace this opportunity of gratifying the secret rivalry that had long subsisted between the two largest cities of Italy, and of wholly annihilating, in a political point of view, her hated and envied competitor by abolishing the constitution of the Campanian city.

Superiority of the Romans Tarentum Capitulates

Immense was the impression produced by the fall of Capua, and all the more that it had not been brought about by surprise, but by a two years' siege carried on in spite of all the exertions of Hannibal. It was quite as much a token that the Romans had recovered their ascendancy in Italy, as its defection some years before to Hannibal had been a token that that ascendancy was lost. In vain Hannibal had tried to counteract the impression of this news on his allies by the capture of Rhegium or of the citadel of Tarentum. His forced march to surprise Rhegium had yielded no result. The citadel of Tarentum suffered greatly from famine, after the Tarentino-Carthaginian squadron closed the harbour; but, as the Romans with their much more powerful fleet were able to cut off the supplies from that squadron itself, and the territory, which Hannibal commanded,

Page 578

scarce sufficed to maintain his army, the besiegers on the side next the sea suffered not much less than did the besieged in the citadel, and at length they left the harbour. No enterprise was now successful; Fortune herself seemed to have deserted the Carthaginians. These consequences of the fall of Capua—the deep shock given to the respect and confidence which Hannibal had hitherto enjoyed among the Italian allies, and the endeavours made by every community that was not too deeply compromised to gain readmission on tolerable terms into the Roman symmachy —affected Hannibal much more keenly than the immediate loss. He had to choose one of two courses; either to throw garrisons into the wavering towns, in which case he would weaken still more his army already too weak and would expose his trusty troops to destruction in small divisions or to treachery—500 of his select Numidian horsemen were put to death in this way in 544 on the defection of the town of Salapia; or to pull down and burn the towns which could not be depended on, so as to keep them out of the enemy's hands—a course, which could not raise the spirits of his Italian clients. On the fall of Capua the Romans felt themselves once more confident as to the final issue of the war in Italy; they despatched considerable reinforcements to Spain, where the existence of the Roman army was placed in jeopardy by the fall of the two Scipios; and for the first time since the beginning of the war they ventured on a diminution in the total number of their troops, which had hitherto been annually augmented notwithstanding the annually-increasing difficulty of levying them, and had risen at last to 23 legions. Accordingly in the next year (544) the Italian war was prosecuted more remissly than hitherto by the Romans, although Marcus Marcellus had after the close of the Sicilian war resumed the command of the main army; he applied himself to the besieging of fortresses in the interior, and had indecisive conflicts with the Carthaginians. The struggle for the Acropolis of Tarentum also continued without decisive result. In Apulia Hannibal succeeded in defeating the proconsul Gnaeus Fulvius Centumalus at Herdoneae. In the following year (545) the Romans took steps to regain possession of the second large city, which had passed over to Hannibal, the city of Tarentum. While Marcus Marcellus continued the struggle against Hannibal in person with his wonted obstinacy and energy, and in a two days' battle, beaten on the first day, achieved on the second a costly and bloody victory; while the consul Quintus Fulvius induced the already wavering Lucanians and Hirpinians to change sides and to deliver up their Phoenician garrisons; while well-conducted razzias from Rhegium compelled Hannibal to hasten to the aid of the hard-pressed Bruttians; the veteran Quintus Fabius, who had once more—for the fifth time—accepted the consulship and along with it the commission to reconquer Tarentum, established

Page 579

himself firmly in the neighbouring Messapian territory, and the treachery of a Bruttian division of the garrison surrendered to him the city. Fearful excesses were committed by the exasperated victors. They put to death all of the garrison or of the citizens whom they could find, and pillaged the houses. 30,000 Tarentines are said to have been sold as slaves, and 3000 talents (730,000 pounds) are stated to have been sent to the state treasury. It was the last feat in arms of the general of eighty years; Hannibal arrived to the relief of the city when all was over, and withdrew to Metapontum.

Hannibal Driven Back Death of Marcellus

After Hannibal had thus lost his most important acquisitions and found himself hemmed in by degrees to the south-western point of the peninsula, Marcus Marcellus, who had been chosen consul for the next year (546), hoped that, in connection with his capable colleague Titus Quintius Crispinus, he should be able to terminate the war by a decisive attack. The old soldier was not disturbed by the burden of his sixty years; sleeping and waking he was haunted by the one thought of defeating Hannibal and of liberating Italy. But fate reserved that wreath of victory for a younger brow. While engaged in an unimportant reconnaissance in the district of Venusia, both consuls were suddenly attacked by a division of African cavalry. Marcellus maintained the unequal struggle—as he had fought forty years before against Hamilcar and fourteen years before at Clastidium—till he sank dying from his horse; Crispinus escaped, but died of his wounds received in the conflict (546).

Pressure of the War

It was now the eleventh year of the war. The danger which some years before had threatened the very existence of the state seemed to have vanished; but all the more the Romans felt the heavy burden—a burden pressing more severely year after year—of the endless war. The finances of the state suffered beyond measure. After the battle of Cannae (538) a special bank-commission (-tres viri mensarii-) had been appointed, composed of men held in the highest esteem, to form a permanent and circumspect board of superintendence for the public finances in these difficult times. It may have done what it could; but the state of things was such as to baffle all financial sagacity. At the very beginning of the war the Romans had debased the silver and copper coin, raised the legal value of the silver piece more than a third, and issued a gold coin far above the value of the metal. This very soon proved insufficient; they were obliged to take supplies from the contractors on credit, and connived at their conduct because they needed them, till the scandalous malversation at last induced the aediles to make an example of some of the worst by impeaching them before the people. Appeals were often made, and not in vain, to the patriotism of the wealthy, who were in fact the very persons that

Page 580

suffered comparatively the most. The soldiers of the better classes and the subaltern officers and equites in a body, either voluntarily or constrained by the -esprit de corps-, declined to receive pay. The owners of the slaves armed by the state and manumitted after the engagement at Beneventum(3) replied to the bank-commission, which offered them payment, that they would allow it to stand over to the end of the war (540). When there was no longer money in the exchequer for the celebration of the national festivals and the repairs of the public buildings, the companies which had hitherto contracted for these matters declared themselves ready to continue their services for a time without remuneration (540). A fleet was even fitted out and manned, just as in the first Punic war, by means of a voluntary loan among the rich (544). They spent the moneys belonging to minors; and at length, in the year of the conquest of Tarentum, they laid hands on the last long-spared reserve fund (164,000 pounds). The state nevertheless was unable to meet its most necessary payments; the pay of the soldiers fell dangerously into arrear, particularly in the more remote districts. But the embarrassment of the state was not the worst part of the material distress. Everywhere the fields lay fallow: even where the war did not make havoc, there was a want of hands for the hoe and the sickle. The price of the -medimnus-(a bushel and a half) had risen to 15 -denarii- (10s.), at least three times the average price in the capital; and many would have died of absolute want, if supplies had not arrived from Egypt, and if, above all, the revival of agriculture in Sicily(4) had not prevented the distress from coming to the worst. The effect which such a state of things must have had in ruining the small farmers, in eating away the savings which had been so laboriously acquired, and in converting flourishing villages into nests of beggars and brigands, is illustrated by similar wars of which fuller details have been preserved.

The Allies

Still more ominous than this material distress was the increasing aversion of the allies to the Roman war, which consumed their substance and their blood. In regard to the non-Latin communities, indeed, this was of less consequence. The war itself showed that they could do nothing, so long as the Latin nation stood by Rome; their greater or less measure of dislike was not of much moment. Now, however, Latium also began to waver. Most of the Latin communes in Etruria, Latium, the territory of the Marsians, and northern Campania—and so in those very districts of Italy which directly had suffered least from the war—announced to the Roman senate in 545 that thenceforth they would send neither contingents nor contributions, and would leave it to the Romans themselves to defray the costs of a war waged in their interest. The consternation in Rome was great; but for the moment there were no means of compelling the refractory. Fortunately

Page 581

all the Latin communities did not act in this way. The colonies in the land of the Gauls, in Picenum, and in southern Italy, headed by the powerful and patriotic Fregellae, declared on the contrary that they adhered the more closely and faithfully to Rome; in fact, it was very clearly evident to all of these that in the present war their existence was, if possible, still more at stake than that of the capital, and that this war was really waged not for Rome merely, but for the Latin hegemony in Italy, and in truth for the independence of the Italian nation. That partial defection itself was certainly not high treason, but merely the result of shortsightedness and exhaustion; beyond doubt these same towns would have rejected with horror an alliance with the Phoenicians. But still there was a variance between Romans and Latins, which did not fail injuriously to react on the subject population of these districts. A dangerous ferment immediately showed itself in Arretium; a conspiracy organized in the interest of Hannibal among the Etruscans was discovered, and appeared so perilous that Roman troops were ordered to march thither. The military and police suppressed this movement without difficulty; but it was a significant token of what might happen in those districts, if once the Latin strongholds ceased to inspire terror.

Hasdrubal's Approach

Amidst these difficulties and strained relations, news suddenly arrived that Hasdrubal had crossed the Pyrenees in the autumn of 546, and that the Romans must be prepared to carry on the war next year with both the sons of Hamilcar in Italy. Not in vain had Hannibal persevered at his post throughout the long anxious years; the aid, which the factious opposition at home and the shortsighted Philip had refused to him, was at length in the course of being brought to him by his brother, who, like himself, largely inherited the spirit of Hamilcar. Already 8000 Ligurians, enlisted by Phoenician gold, were ready to unite with Hasdrubal; if he gained the first battle, he might hope that like his brother he should be able to bring the Gauls and perhaps the Etruscans into arms against Rome. Italy, moreover, was no longer what it had been eleven years before; the state and the individual citizens were exhausted, the Latin league was shaken, their best general had just fallen in the field of battle, and Hannibal was not subdued. In reality Scipio might bless the star of his genius, if it averted the consequences of his unpardonable blunder from himself and from his country.

New Armaments

Hasdrubal and Hannibal on the March

Page 582

As in the times of the utmost danger, Rome once more called out twenty-three legions. Volunteers were summoned to arm, and those legally exempt from military service were included in the levy. Nevertheless, they were taken by surprise. Far earlier than either friends or foes expected, Hasdrubal was on the Italian side of the Alps (547); the Gauls, now accustomed to such transits, were readily bribed to open their passes, and furnished what the army required. If the Romans had any intention of occupying the outlets of the Alpine passes, they were again too late; already they heard that Hasdrubal was on the Po, that he was calling the Gauls to arms as successfully as his brother had formerly done, that Placentia was invested. With all haste the consul Marcus Livius proceeded to the northern army; and it was high time that he should appear. Etruria and Umbria were in sullen ferment; volunteers from them reinforced the Phoenician army. His colleague Gaius Nero summoned the praetor Gaius Hostilius Tubulus from Venusia to join him, and hastened with an army of 40,000 men to intercept the march of Hannibal to the north. The latter collected all his forces in the Bruttian territory, and, advancing along the great road leading from Rhegium to Apulia, encountered the consul at Grumentum. An obstinate engagement took place in which Nero claimed the victory; but Hannibal was able at all events, although with some loss, to evade the enemy by one of his usual adroit flank-marches, and to reach Apulia without hindrance. There he halted, and encamped at first at Venusia, then at Canusium: Nero, who had followed closely in his steps, encamped opposite to him at both places. That Hannibal voluntarily halted and was not prevented from advancing by the Roman army, appears to admit of no doubt; the reason for his taking up his position exactly at this point and not farther to the north, must have depended on arrangements concerted between himself and Hasdrubal, or on conjectures as to the route of the latter's march, with which we are not acquainted. While the two armies thus lay inactive, face to face, the despatch from Hasdrubal which was anxiously expected in Hannibal's camp was intercepted by the outposts of Nero. It stated that Hasdrubal intended to take the Flaminian road, in other words, to keep in the first instance along the coast and then at Fanum to turn across the Apennines towards Narnia, at which place he hoped to meet Hannibal. Nero immediately ordered the reserve in the capital to proceed to Narnia as the point selected for the junction of the two Phoenician armies, while the division stationed at Capua went to the capital, and a new reserve was formed there. Convinced that Hannibal was not acquainted with the purpose of his brother and would continue to await him in Apulia, Nero resolved on the bold experiment of hastening northward by forced marches with a small but select corps of 7000 men and, if possible, in connection with his colleague, compelling Hasdrubal to fight. He was able to do so, for the Roman army which he left behind still continued strong enough either to hold its ground against Hannibal if he should attack it, or to accompany him and to arrive simultaneously with him at the decisive scene of action, should he depart.

Page 583

Battle of Sena
Death of Hasdrubal

Nero found his colleague Marcus Livius at Sena Gallica awaiting the enemy. Both consuls at once marched against Hasdrubal, whom they found occupied in crossing the Metaurus. Hasdrubal wished to avoid a battle and to escape from the Romans by a flank movement, but his guides left him in the lurch; he lost his way on the ground strange to him, and was at length attacked on the march by the Roman cavalry and detained until the Roman infantry arrived and a battle became inevitable. Hasdrubal stationed the Spaniards on the right wing, with his ten elephants in front of it, and the Gauls on the left, which he kept back. Long the fortune of battle wavered on the right wing, and the consul Livius who commanded there was hard pressed, till Nero, repeating his strategical operation as a tactical manoeuvre, allowed the motionless enemy opposite to him to remain as they stood, and marching round his own army fell upon the flank of the Spaniards. This decided the day. The severely fought and very bloody victory was complete; the army, which had no retreat, was destroyed, and the camp was taken by assault. Hasdrubal, when he saw the admirably-conducted battle lost, sought and found like his father an honourable soldier's death. As an officer and a man, he was worthy to be the brother of Hannibal.

Hannibal Retires to the Bruttian Territory

On the day after the battle Nero started, and after scarcely fourteen days' absence once more confronted Hannibal in Apulia, whom no message had reached, and who had not stirred. The consul brought the message with him; it was the head of Hannibal's brother, which the Roman ordered to be thrown into the enemy's outposts, repaying in this way his great antagonist, who scorned to war with the dead, for the honourable burial which he had given to Paullus, Gracchus, and Marcellus. Hannibal saw that his hopes had been in vain, and that all was over. He abandoned Apulia and Lucania, even Metapontum, and retired with his troops to the land of the Bruttians, whose ports formed his only means of withdrawal from Italy. By the energy of the Roman generals, and still more by a conjuncture of unexampled good fortune, a peril was averted from Rome, the greatness of which justified Hannibal's tenacious perseverance in Italy, and which fully bears comparison with the magnitude of the peril of Cannae. The joy in Rome was boundless; business was resumed as in time of peace; every one felt that the danger of the war was surmounted.

Stagnation of the War in Italy

Nevertheless the Romans were in no hurry to terminate the war. The state and the citizens were exhausted by the excessive moral and material strain on their energies; men gladly abandoned themselves to carelessness and repose.

The army and fleet were reduced; the Roman and Latin farmers were brought back to their desolate homesteads the exchequer was filled by the sale of a portion of the Campanian domains. The administration of the state was regulated anew and the disorders which had prevailed were done away; the repayment of the voluntary war-loan was begun, and the Latin communities that remained in arrears were compelled to fulfil their neglected obligations with heavy interest.

Page 584

The war in Italy made no progress. It forms a brilliant proof of the strategic talent of Hannibal as well as of the incapacity of the Roman generals now opposed to him, that after this he was still able for four years to keep the field in the Bruttian country, and that all the superiority of his opponents could not compel him either to shut himself up in fortresses or to embark. It is true that he was obliged to retire farther and farther, not so much in consequence of the indecisive engagements which took place with the Romans, as because his Bruttian allies were always becoming more troublesome, and at last he could only reckon on the towns which his army garrisoned. Thus he voluntarily abandoned Thurii; Locri was, on the suggestion of Publius Scipio, recaptured by an expedition from Rhegium (549). As if at last his projects were to receive a brilliant justification at the hands of the very Carthaginian authorities who had thwarted him in them, these now, in their apprehension as to the anticipated landing of the Romans, revived of their own accord those plans (548, 549), and sent reinforcements and subsidies to Hannibal in Italy, and to Mago in Spain, with orders to rekindle the war in Italy so as to achieve some further respite for the trembling possessors of the Libyan country houses and the shops of Carthage. An embassy was likewise sent to Macedonia, to induce Philip to renew the alliance and to land in Italy (549). But it was too late. Philip had made peace with Rome some months before; the impending political annihilation of Carthage was far from agreeable to him, but he took no step openly at least against Rome. A small Macedonian corps went to Africa, the expenses of which, according to the assertion of the Romans, were defrayed by Philip from his own pocket; this may have been the case, but the Romans had at any rate no proof of it, as the subsequent course of events showed. No Macedonian landing in Italy was thought of.

Mago in Italy

Mago, the youngest son of Hamilcar, set himself to his task more earnestly. With the remains of the Spanish army, which he had conducted in the first instance to Minorca, he landed in 549 at Genoa, destroyed the city, and summoned the Ligurians and Gauls to arms. Gold and the novelty of the enterprise led them now, as always, to come to him in troops; he had formed connections even throughout Etruria, where political prosecutions never ceased. But the troops which he had brought with him were too few for a serious enterprise against Italy proper; and Hannibal likewise was much too weak, and his influence in Lower Italy had fallen much too low, to permit him to advance with any prospect of success. The rulers of Carthage had not been willing to save their native country, when its salvation was possible; now, when they were willing, it was possible no longer.

The African Expedition of Scipio

Page 585

Nobody probably in the Roman senate doubted either that the war on the part of Carthage against Rome was at an end, or that the war on the part of Rome against Carthage must now be begun; but unavoidable as was the expedition to Africa, they were afraid to enter on its preparation. They required for it, above all, an able and beloved leader; and they had none. Their best generals had either fallen in the field of battle, or they were, like Quintus Fabius and Quintus Fulvius, too old for such an entirely new and probably tedious war. The victors of Sena, Gaius Nero and Marcus Livius, would perhaps have been equal to the task, but they were both in the highest degree unpopular aristocrats; it was doubtful whether they would succeed in procuring the command—matters had already reached such a pass that ability, as such, determined the popular choice only in times of grave anxiety—and it was more than doubtful whether these were the men to stimulate the exhausted people to fresh exertions. At length Publius Scipio returned from Spain, and the favourite of the multitude, who had so brilliantly fulfilled, or at any rate seemed to have fulfilled, the task with which it had entrusted him, was immediately chosen consul for the next year. He entered on office (549) with the firm determination of now realizing that African expedition which he had projected in Spain. In the senate, however, not only was the party favourable to a methodical conduct of the war unwilling to entertain the project of an African expedition so long as Hannibal remained in Italy, but the majority was by no means favourably disposed towards the young general himself. His Greek refinement and his modern culture and tone of thought were but little agreeable to the austere and somewhat boorish fathers of the city; and serious doubts existed both as to his conduct of the Spanish war and as to his military discipline. How much ground there was for the objection that he showed too great indulgence towards his officers of division, was very soon demonstrated by the disgraceful proceedings of Gaius Pleminius at Locri, the blame of which certainly was indirectly chargeable to the scandalous negligence which marked Scipio's supervision. In the proceedings in the senate regarding the organization of the African expedition and the appointment of a general for it, the new consul, wherever usage or the constitution came into conflict with his private views, showed no great reluctance to set such obstacles aside, and very clearly indicated that in case of need he was disposed to rely for support against the governing board on his fame and his popularity with the people. These things could not but annoy the senate and awaken, moreover, serious apprehension as to whether, in the impending decisive war and the eventual negotiations for peace with Carthage, such a general would hold himself bound by the instructions which he received—an apprehension which his arbitrary management of the Spanish expedition

Page 586

was by no means fitted to allay. Both sides, however, displayed wisdom enough not to push matters too far. The senate itself could not fail to see that the African expedition was necessary, and that it was not wise indefinitely to postpone it; it could not fail to see that Scipio was an extremely able officer and so far well adapted to be the leader in such a war, and that he, if any one, could prevail on the people to protract his command as long as was necessary and to put forth their last energies. The majority came to the resolution not to refuse to Scipio the desired commission, after he had previously observed, at least in form, the respect due to the supreme governing board and had submitted himself beforehand to the decree of the senate. Scipio was to proceed this year to Sicily to superintend the building of the fleet, the preparation of siege materials, and the formation of the expeditionary army, and then in the following year to land in Africa. For this purpose the army of Sicily—still composed of those two legions that were formed from the remnant of the army of Cannae—was placed at his disposal, because a weak garrison and the fleet were quite sufficient for the protection of the island; and he was permitted moreover to raise volunteers in Italy. It was evident that the senate did not appoint the expedition, but merely allowed it: Scipio did not obtain half the resources which had formerly been placed at the command of Regulus, and he got that very corps which for years had been subjected by the senate to intentional degradation. The African army was, in the view of the majority of the senate, a forlorn hope of disrated companies and volunteers, the loss of whom in any event the state had no great occasion to regret.

Any one else than Scipio would perhaps have declared that the African expedition must either be undertaken with other means, or not at all; but Scipio's confidence accepted the terms, whatever they were, solely with the view of attaining the eagerly-coveted command. He carefully avoided, as far as possible, the imposition of direct burdens on the people, that he might not injure the popularity of the expedition. Its expenses, particularly those of building the fleet which were considerable, were partly procured by what was termed a voluntary contribution of the Etruscan cities—that is, by a war tribute imposed as a punishment on the Arretines and other communities disposed to favour the Phoenicians—partly laid upon the cities of Sicily. In forty days the fleet was ready for sea. The crews were reinforced by volunteers, of whom seven thousand from all parts of Italy responded to the call of the beloved officer. So Scipio set sail for Africa in the spring of 550 with two strong legions of veterans (about 30,000 men), 40 vessels of war, and 400 transports, and landed successfully, without meeting the slightest resistance, at the Fair Promontory in the neighbourhood of Utica.

Page 587

Preparations in Africa

The Carthaginians, who had long expected that the plundering expeditions, which the Roman squadrons had frequently made during the last few years to the African coast, would be followed by a more serious invasion, had not only, in order to ward it off, endeavoured to bring about a revival of the Italo-Macedonian war, but had also made armed preparation at home to receive the Romans. Of the two rival Berber kings, Massinissa of Cirta (Constantine), the ruler of the Massylians, and Syphax of Siga (at the mouth of the Tafna westward from Oran), the ruler of the Massaesylians, they had succeeded in attaching the latter, who was far the more powerful and hitherto had been friendly to the Romans, by treaty and marriage alliance closely to Carthage, while they cast off the other, the old rival of Syphax and ally of the Carthaginians. Massinissa had after desperate resistance succumbed to the united power of the Carthaginians and of Syphax, and had been obliged to leave his territories a prey to the latter; he himself wandered with a few horsemen in the desert. Besides the contingent to be expected from Syphax, a Carthaginian army of 20,000 foot, 6000 cavalry, and 140 elephants—Hanno had been sent out to hunt elephants for the very purpose—was ready to fight for the protection of the capital, under the command of Hasdrubal son of Gisgo, a general who had gained experience in Spain; in the port there lay a strong fleet. A Macedonian corps under Sopater, and a consignment of Celtiberian mercenaries, were immediately expected.

Scipio Driven Back to the Coast Surprise of the Carthaginian Camp

On the report of Scipio's landing, Massinissa immediately arrived in the camp of the general, whom not long before he had confronted as an enemy in Spain; but the landless prince brought in the first instance nothing beyond his personal ability to the aid of the Romans, and the Libyans, although heartily weary of levies and tribute, had acquired too bitter experience in similar cases to declare at once for the invaders. So Scipio began the campaign. So long as he was only opposed by the weaker Carthaginian army, he had the advantage, and was enabled after some successful cavalry skirmishes to proceed to the siege of Utica; but when Syphax arrived, according to report with 50,000 infantry and 10,000 cavalry, the siege had to be raised, and a fortified naval camp had to be constructed for the winter on a promontory, which easily admitted of entrenchment, between Utica and Carthage. Here the Roman general passed the winter of 550-1. From the disagreeable situation in which the spring found him he extricated himself by a fortunate -coup de main-. The Africans, lulled into security by proposals of peace suggested by Scipio with more artifice than honour, allowed themselves to be surprised on one and the same night in their two camps; the reed huts of the Numidians burst into flames, and, when the Carthaginians hastened to their help, their

Page 588

own camp shared the same fate; the fugitives were slain without resistance by the Roman divisions. This nocturnal surprise was more destructive than many a battle; nevertheless the Carthaginians did not suffer their courage to sink, and they rejected even the advice of the timid, or rather of the judicious, to recall Mago and Hannibal. Just at this time the expected Celtiberian and Macedonian auxiliaries arrived; it was resolved once more to try a pitched battle on the "Great Plains," five days' march from Utica. Scipio hastened to accept it; with little difficulty his veterans and volunteers dispersed the hastily-collected host of Carthaginians and Numidians, and the Celtiberians, who could not reckon on any mercy from Scipio, were cut down after obstinate resistance. After this double defeat the Africans could no longer keep the field. An attack on the Roman naval camp attempted by the Carthaginian fleet, while not unsuccessful, was far from decisive, and was greatly outweighed by the capture of Syphax, which Scipio's singular good fortune threw in his way, and by which Massinissa became to the Romans what Syphax had been at first to the Carthaginians.

Negotiations for Peace Machinations of the Carthaginian Patriots

After such defeats the Carthaginian peace party, which had been reduced to silence for sixteen years, was able once more to raise its head and openly to rebel against the government of the Barcides and the patriots. Hasdrubal son of Gisgo was in his absence condemned by the government to death, and an attempt was made to obtain an armistice and peace from Scipio. He demanded the cession of their Spanish possessions and of the islands of the Mediterranean, the transference of the kingdom of Syphax to Massinissa, the surrender of all their vessels of war except 20, and a war contribution of 4000 talents (nearly 1,000,000 pounds)—terms which seemed so singularly favourable to Carthage, that the question obtrudes itself whether they were offered by Scipio more in his own interest or in that of Rome. The Carthaginian plenipotentiaries accepted them under reservation of their being ratified by the respective authorities, and accordingly a Carthaginian embassy was despatched to Rome. But the patriot party in Carthage were not disposed to give up the struggle so cheaply; faith in the nobleness of their cause, confidence in their great leader, even the example that had been set to them by Rome herself, stimulated them to persevere, apart from the fact that peace of necessity involved the return of the opposite party to the helm of affairs and their own consequent destruction. The patriotic party had the ascendancy among the citizens; it was resolved to allow the opposition to negotiate for peace, and meanwhile to prepare for a last and decisive effort. Orders were sent to Mago and Hannibal to return with all speed to Africa. Mago, who for three years (549-551) had been labouring to bring about a coalition

Page 589

in Northern Italy against Rome, had just at this time in the territory of the Insubres (about Milan) been defeated by the far superior double army of the Romans. The Roman cavalry had been brought to give way, and the infantry had been thrown into confusion; victory seemed on the point of declaring for the Carthaginians, when a bold attack by a Roman troop on the enemy's elephants, and above all a serious wound received by their beloved and able commander, turned the fortune of the battle. The Phoenician army was obliged to retreat to the Ligurian coast, where it received and obeyed the order to embark; but Mago died of his wound on the voyage.

Hannibal Recalled to Africa

Hannibal would probably have anticipated the order, had not the last negotiations with Philip presented to him a renewed prospect of rendering better service to his country in Italy than in Libya; when he received it at Croton, where he latterly had his headquarters, he lost no time in complying with it. He caused his horses to be put to death as well as the Italian soldiers who refused to follow him over the sea, and embarked in the transports that had been long in readiness in the roadstead of Croton. The Roman citizens breathed freely, when the mighty Libyan lion, whose departure no one even now ventured to compel, thus voluntarily turned his back on Italian ground. On this occasion the decoration of a grass wreath was bestowed by the senate and burgesses on the only survivor of the Roman generals who had traversed that troubled time with honour, the veteran of nearly ninety years, Quintus Fabius. To receive this wreath—which by the custom of the Romans the army that a general had saved presented to its deliverer—at the hands of the whole community was the highest distinction which had ever been bestowed upon a Roman citizen, and the last honorary decoration accorded to the old general, who died in the course of that same year (551). Hannibal, doubtless not under the protection of the armistice, but solely through his rapidity of movement and good fortune, arrived at Leptis without hindrance, and the last of the “lion's brood” of Hamilcar trode once more, after an absence of thirty-six years, his native soil. He had left it, when still almost a boy, to enter on that noble and yet so thoroughly fruitless career of heroism, in which he had set out towards the west to return homewards from the east, having described a wide circle of victory around the Carthaginian sea. Now, when what he had wished to prevent, and what he would have prevented had he been allowed, was done, he was summoned to help and if possible, to save; and he obeyed without complaint or reproach.

Recommencement of Hostilities

Page 590

On his arrival the patriot party came forward openly; the disgraceful sentence against Hasdrubal was cancelled; new connections were formed with the Numidian sheiks through the dexterity of Hannibal; and not only did the assembly of the people refuse to ratify the peace practically concluded, but the armistice was broken by the plundering of a Roman transport fleet driven ashore on the African coast, and by the seizure even of a Roman vessel of war carrying Roman envoys. In just indignation Scipio started from his camp at Tunes (552) and traversed the rich valley of the Bagradas (Mejerdah), no longer allowing the townships to capitulate, but causing the inhabitants of the villages and towns to be seized en masse and sold. He had already penetrated far into the interior, and was at Naraggara (to the west of Sicca, now El Kef, on the frontier between Tunis and Algiers), when Hannibal, who had marched out from Hadrumetum, fell in with him. The Carthaginian general attempted to obtain better conditions from the Roman in a personal conference; but Scipio, who had already gone to the extreme verge of concession, could not possibly after the breach of the armistice agree to yield further, and it is not credible that Hannibal had any other object in this step than to show to the multitude that the patriots were not absolutely opposed to peace. The conference led to no result.

Battle of Zama

The two armies accordingly came to a decisive battle at Zama (presumably not far from Sicca).(5) Hannibal arranged his infantry in three lines; in the first rank the Carthaginian hired troops, in the second the African militia and the Phoenician civic force along with the Macedonian corps, in the third the veterans who had followed him from Italy. In front of the line were placed the 80 elephants; the cavalry were stationed on the wings. Scipio likewise disposed his legions in three ranks, as was the wont of the Romans, and so arranged them that the elephants could pass through and alongside of the line without breaking it. Not only was this disposition completely successful, but the elephants making their way to the side disordered also the Carthaginian cavalry on the wings, so that Scipio's cavalry—which moreover was by the arrival of Massinissa's troops rendered far superior to the enemy—had little trouble in dispersing them, and were soon engaged in full pursuit. The struggle of the infantry was more severe. The conflict lasted long between the first ranks on either side; at length in the extremely bloody hand-to-hand encounter both parties fell into confusion, and were obliged to seek a support in the second ranks. The Romans found that support; but the Carthaginian militia showed itself so unsteady and wavering, that the mercenaries believed themselves betrayed and a hand-to-hand combat arose between them and the Carthaginian civic force. But Hannibal now hastily withdrew what remained of the first two lines to the flanks, and pushed forward his choice

Page 591

Italian troops along the whole line. Scipio, on the other hand, gathered together in the centre as many of the first line as still were able to fight, and made the second and third ranks close up on the right and left of the first. Once more on the same spot began a still more fearful conflict; Hannibal's old soldiers never wavered in spite of the superior numbers of the enemy, till the cavalry of the Romans and of Massinissa, returning from the pursuit of the beaten cavalry of the enemy, surrounded them on all sides. This not only terminated the struggle, but annihilated the Phoenician army; the same soldiers, who fourteen years before had given way at Cannae, had retaliated on their conquerors at Zama. With a handful of men Hannibal arrived, a fugitive, at Hadrumetum.

Peace

After this day folly alone could counsel a continuance of the war on the part of Carthage. On the other hand it was in the power of the Roman general immediately to begin the siege of the capital, which was neither protected nor provisioned, and, unless unforeseen accidents should intervene, now to subject Carthage to the fate which Hannibal had wished to bring upon Rome. Scipio did not do so; he granted peace (553), but no longer upon the former terms. Besides the concessions which had already in the last negotiations been demanded in favour of Rome and of Massinissa, an annual contribution of 200 talents (48,000 pounds) was imposed for fifty years on the Carthaginians; and they had to bind themselves that they would not wage war against Rome or its allies or indeed beyond the bounds of Africa at all, and that in Africa they would not wage war beyond their own territory without having sought the permission of Rome—the practical effect of which was that Carthage became tributary and lost her political independence. It even appears that the Carthaginians were bound in certain cases to furnish ships of war to the Roman fleet.

Scipio has been accused of granting too favourable conditions to the enemy, lest he might be obliged to hand over the glory of terminating the most severe war which Rome had waged, along with his command, to a successor. The charge might have had some foundation, had the first proposals been carried out; it seems to have no warrant in reference to the second. His position in Rome was not such as to make the favourite of the people, after the victory of Zama, seriously apprehensive of recall—already before the victory an attempt to supersede him had been referred by the senate to the burgesses, and by them decidedly rejected. Nor do the conditions themselves warrant such a charge. The Carthaginian city never, after its hands were thus tied and a powerful neighbour was placed by its side, made even an attempt to withdraw from Roman supremacy, still less to enter into rivalry with Rome; besides, every one who cared to know knew that the war just terminated had been undertaken much more by Hannibal than by Carthage,

Page 592

and that it was absolutely impossible to revive the gigantic plan of the patriot party. It might seem little in the eyes of the vengeful Italians, that only the five hundred surrendered ships of war perished in the flames, and not the hated city itself; spite and pedantry might contend for the view that an opponent is only really vanquished when he is annihilated, and might censure the man who had disdained to punish more thoroughly the crime of having made Romans tremble. Scipio thought otherwise; and we have no reason and therefore no right to assume that the Roman was in this instance influenced by vulgar motives rather than by the noble and magnanimous impulses which formed part of his character. It was not the consideration of his own possible recall or of the mutability of fortune, nor was it any apprehension of the outbreak of a Macedonian war at certainly no distant date, that prevented the self-reliant and confident hero, with whom everything had hitherto succeeded beyond belief, from accomplishing the destruction of the unhappy city, which fifty years afterwards his adopted grandson was commissioned to execute, and which might indeed have been equally well accomplished now. It is much more probable that the two great generals, on whom the decision of the political question now devolved, offered and accepted peace on such terms in order to set just and reasonable limits on the one hand to the furious vengeance of the victors, on the other to the obstinacy and imprudence of the vanquished. The noble-mindedness and statesmanlike gifts of the great antagonists are no less apparent in the magnanimous submission of Hannibal to what was inevitable, than in the wise abstinence of Scipio from an extravagant and insulting use of victory. Is it to be supposed that one so generous, unprejudiced, and intelligent should not have asked himself of what benefit it could be to his country, now that the political power of the Carthaginian city was annihilated, utterly to destroy that ancient seat of commerce and of agriculture, and wickedly to overthrow one of the main pillars of the then existing civilization? The time had not yet come when the first men of Rome lent themselves to destroy the civilization of their neighbours, and frivolously fancied that they could wash away from themselves the eternal infamy of the nation by shedding an idle tear.

Results of the War

Thus ended the second Punic or, as the Romans more correctly called it, the Hannibalic war, after it had devastated the lands and islands from the Hellespont to the Pillars of Hercules for seventeen years. Before this war the policy of the Romans had no higher aim than to acquire command of the mainland of the Italian peninsula within its natural boundaries, and of the Italian islands and seas; it is clearly proved by their treatment of Africa on the conclusion of peace that they also terminated the war with the impression, not that they had laid the foundation of sovereignty

Page 593

over the states of the Mediterranean or of the so-called universal empire, but that they had rendered a dangerous rival innocuous and had given to Italy agreeable neighbours. It is true doubtless that other results of the war, the conquest of Spain in particular, little accorded with such an idea; but their very successes led them beyond their proper design, and it may in fact be affirmed that the Romans came into possession of Spain accidentally. The Romans achieved the sovereignty of Italy, because they strove for it; the hegemony—and the sovereignty which grew out of it—over the territories of the Mediterranean was to a certain extent thrown into the hands of the Romans by the force of circumstances without intention on their part to acquire it.

Out of Italy

The immediate results of the war out of Italy were, the conversion of Spain into two Roman provinces—which, however, were in perpetual insurrection; the union of the hitherto dependent kingdom of Syracuse with the Roman province of Sicily; the establishment of a Roman instead of a Carthaginian protectorate over the most important Numidian chiefs; and lastly the conversion of Carthage from a powerful commercial state into a defenceless mercantile town. In other words, it established the uncontested hegemony of Rome over the western region of the Mediterranean. Moreover, in its further development, it led to that necessary contact and interaction between the state systems of the east and the west, which the first Punic war had only foreshadowed; and thereby gave rise to the proximate decisive interference of Rome in the conflicts of the Alexandrine monarchies.

In Italy

As to its results in Italy, first of all the Celts were now certainly, if they had not been already beforehand, destined to destruction; and the execution of the doom was only a question of time. Within the Roman confederacy the effect of the war was to bring into more distinct prominence the ruling Latin nation, whose internal union had been tried and attested by the peril which, notwithstanding isolated instances of wavering, it had surmounted on the whole in faithful fellowship; and to depress still further the non-Latin or non-Latinized Italians, particularly the Etruscans and the Sabellians of Lower Italy. The heaviest punishment or rather vengeance was inflicted partly on the most powerful, partly on those who were at once the earliest and latest, allies of Hannibal—the community of Capua, and the land of the Bruttians. The Capuan constitution was abolished, and Capua was reduced from the second city into the first village of Italy; it was even proposed to raze the city and level it with the ground. The whole soil, with the exception of a few possessions of foreigners or of Campanians well disposed towards Rome, was declared by the senate to be public domain, and was thereafter parcelled out to small occupiers on temporary lease. The Picentes on the Silarus were similarly treated;

Page 594

their capital was razed, and the inhabitants were dispersed among the surrounding villages. The doom of the Bruttians was still more severe; they were converted en masse into a sort of bondsmen to the Romans, and were for ever excluded from the right of bearing arms. The other allies of Hannibal also dearly expiated their offence. The Greek cities suffered severely, with the exception of the few which had steadfastly adhered to Rome, such as the Campanian Greeks and the Rhegines. Punishment not much lighter awaited the Arpanians and a number of other Apulian, Lucanian, and Samnite communities, most of which lost portions of their territory. On a part of the lands thus acquired new colonies were settled. Thus in the year 560 a succession of burgess-colonies was sent to the best ports of Lower Italy, among which Sipontum (near Manfredonia) and Croton may be named, as also Salernum placed in the former territory of the southern Picentes and destined to hold them in check, and above all Puteoli, which soon became the seat of the genteel -villeggiatura-and of the traffic in Asiatic and Egyptian luxuries. Thurii became a Latin fortress under the new name of Copia (560), and the rich Bruttian town of Vibo under the name of Valentia (562). The veterans of the victorious army of Africa were settled singly on various patches of land in Samnium and Apulia; the remainder was retained as public land, and the pasture stations of the grandees of Rome replaced the gardens and arable fields of the farmers. As a matter of course, moreover, in all the communities of the peninsula the persons of note who were not well affected to Rome were got rid of, so far as this could be accomplished by political processes and confiscations of property. Everywhere in Italy the non-Latin allies felt that their name was meaningless, and that they were thenceforth subjects of Rome; the vanquishing of Hannibal was felt as a second subjugation of Italy, and all the exasperation and all the arrogance of the victor vented themselves especially on the Italian allies who were not Latin. Even the colourless Roman comedy of this period, well subjected as it was to police control, bears traces of this. When the subjugated towns of Capua and Atella were abandoned without restraint to the unbridled wit of the Roman farce, so that the latter town became its very stronghold, and when other writers of comedy jested over the fact that the Campanian serfs had already learned to survive amidst the deadly atmosphere in which even the hardiest race of slaves, the Syrians, pined away; such unfeeling mockeries re-echoed the scorn of the victors, but not less the cry of distress from the down-trodden nations. The position in which matters stood is shown by the anxious carefulness, which during the ensuing Macedonian war the senate evinced in the watching of Italy, and by the reinforcements which were despatched from Rome to the most important colonies, to Venusia in 554, Narnia in 555, Cosa in 557, and Cales shortly before 570.

Page 595

What blanks were produced by war and famine in the ranks of the Italian population, is shown by the example of the burgesses of Rome, whose numbers during the war had fallen almost a fourth. The statement, accordingly, which puts the whole number of Italians who fell in the war under Hannibal at 300,000, seems not at all exaggerated. Of course this loss fell chiefly on the flower of the burgesses, who in fact furnished the -elite- as well as the mass of the combatants. How fearfully the senate in particular was thinned, is shown by the filling up of its complement after the battle of Cannae, when it had been reduced to 123 persons, and was with difficulty restored to its normal state by an extraordinary nomination of 177 senators. That, moreover, the seventeen years' war, which had been carried on simultaneously in all districts of Italy and towards all the four points of the compass abroad, must have shaken to the very heart the national economy, is, as a general position, clear; but our tradition does not suffice to illustrate it in detail. The state no doubt gained by the confiscations, and the Campanian territory in particular thenceforth remained an inexhaustible source of revenue to the state; but by this extension of the domain system the national prosperity of course lost just about as much as at other times it had gained by the breaking up of the state lands. Numbers of flourishing townships—four hundred, it was reckoned—were destroyed and ruined; the capital laboriously accumulated was consumed; the population were demoralized by camp life; the good old traditional habits of the burgesses and farmers were undermined from the capital down to the smallest village. Slaves and desperadoes associated themselves in robber-bands, of the dangers of which an idea may be formed from the fact that in a single year (569) 7000 men had to be condemned for highway robbery in Apulia alone; the extension of the pastures, with their half-savage slave-herdsmen, favoured this mischievous barbarizing of the land. Italian agriculture saw its very existence endangered by the proof, first afforded in this war, that the Roman people could be supported by grain from Sicily and from Egypt instead of that which they reaped themselves.

Nevertheless the Roman, whom the gods had allowed to survive the close of that gigantic struggle, might look with pride to the past and with confidence to the future. Many errors had been committed, but much suffering had also been endured; the people, whose whole youth capable of arms had for ten years hardly laid aside shield or sword, might excuse many faults. The living of different nations side by side in peace and amity upon the whole—although maintaining an attitude of mutual antagonism—which appears to be the aim of modern phases of national life, was a thing foreign to antiquity. In ancient times it was necessary to be either anvil or hammer; and in the final struggle between the victors victory

Page 596

remained with the Romans. Whether they would have the judgment to use it rightly—to attach the Latin nation by still closer bonds to Rome, gradually to Latinize Italy, to rule their dependents in the provinces as subjects and not to abuse them as slaves, to reform the constitution, to reinvigorate and to enlarge the tottering middle class—many a one might ask. If they should know how to use it, Italy might hope to see happy times, in which prosperity based on personal exertion under favourable circumstances, and the most decisive political supremacy over the then civilized world, would impart a just self-reliance to every member of the great whole, furnish a worthy aim for every ambition, and open a career for every talent. It would, no doubt, be otherwise, should they fail to use aright their victory. But for the moment doubtful voices and gloomy apprehensions were silent, when from all quarters the warriors and victors returned to their homes; thanksgivings and amusements, and rewards to the soldiers and burgesses were the order of the day; the released prisoners of war were sent home from Gaul, Africa, and Greece; and at length the youthful conqueror moved in splendid procession through the decorated streets of the capital, to deposit his laurels in the house of the god by whose direct inspiration, as the pious whispered one to another, he had been guided in counsel and in action.

Notes for Chapter VI

1. III. III. The Celts Conquered by Rome
2. III. Vi. The Sending of Reinforcements Temporarily Frustrated
3. III. Vi. Conflicts in the South of Italy
4. III. Vi. Sicily Tranquillized
5. Of the two places bearing this name, the more westerly, situated about 60 miles west of Hadrumentum, was probably the scene of the battle (comp. Hermes, xx. 144, 318). The time was the spring or summer of the year 552; the fixing of the day as the 19th October, on account of the alleged solar eclipse, is of no account.

CHAPTER VII

The West from the Peace of Hannibal to the Close of the Third Period

Subjugation of the Valley of the Po

The war waged by Hannibal had interrupted Rome in the extension of her dominion to the Alps or to the boundary of Italy, as was even now the Roman phrase, and in the

organization and colonizing of the Celtic territories. It was self-evident that the task would now be resumed at the point where it had been broken off, and the Celts were well aware of this. In the very year of the conclusion of peace with Carthage (553) hostilities had recommenced in the territory of the Boii, who were the most immediately exposed to danger; and a first success obtained by them over the hastily-assembled Roman levy, coupled with the persuasions of a Carthaginian officer, Hamilcar, who had been left behind from the expedition of Mago in

Page 597

northern Italy, produced in the following year (554) a general insurrection spreading beyond the two tribes immediately threatened, the Boii and Insubres. The Ligurians were driven to arms by the nearer approach of the danger, and even the youth of the Cenomani on this occasion listened less to the voice of their cautious chiefs than to the urgent appeal of their kinsmen who were in peril. Of "the two barriers against the raids of the Gauls," Placentia and Cremona, the former was sacked—not more than 2000 of the inhabitants of Placentia saved their lives—and the second was invested. In haste the legions advanced to save what they could. A great battle took place before Cremona. The dexterous management and the professional skill of the Phoenician leader failed to make up for the deficiencies of his troops; the Gauls were unable to withstand the onset of the legions, and among the numerous dead who covered the field of battle was the Carthaginian officer. The Celts, nevertheless, continued the struggle; the same Roman army which had conquered at Cremona was next year (555), chiefly through the fault of its careless leader, almost destroyed by the Insubres; and it was not till 556 that Placentia could be partially re-established. But the league of the cantons associated for the desperate struggle suffered from intestine discord; the Boii and Insubres quarrelled, and the Cenomani not only withdrew from the national league, but purchased their pardon from the Romans by a disgraceful betrayal of their countrymen; during a battle in which the Insubres engaged the Romans on the Mincius, the Cenomani attacked in rear, and helped to destroy, their allies and comrades in arms (557). Thus humbled and left in the lurch, the Insubres, after the fall of Comum, likewise consented to conclude a separate peace (558). The conditions, which the Romans prescribed to the Cenomani and Insubres, were certainly harder than they had been in the habit of granting to the members of the Italian confederacy; in particular, they were careful to confirm by law the barrier of separation between Italians and Celts, and to enact that never should a member of these two Celtic tribes be capable of acquiring the citizenship of Rome. But these Transpadane Celtic districts were allowed to retain their existence and their national constitution—so that they formed not town-domains, but tribal cantons—and no tribute, as it would seem, was imposed on them. They were intended to serve as a bulwark for the Roman settlements south of the Po, and to ward off from Italy the incursions of the migratory northern tribes and the aggressions of the predatory inhabitants of the Alps, who were wont to make regular razzias in these districts. The process of Latinizing, moreover, made rapid progress in these regions; the Celtic nationality was evidently far from able to oppose such resistance as the more civilized nations of Sabellians and Etruscans. The celebrated Latin comic poet Statius Caecilius, who died in 586, was a manumitted Insubrian; and Polybius, who visited these districts towards the close of the sixth century, affirms, not perhaps without some exaggeration, that in that quarter only a few villages among the Alps remained Celtic. The Veneti, on the other hand, appear to have retained their nationality longer.

Page 598

Measures Adopted to Check the Immigrations of the Transalpine Gauls

The chief efforts of the Romans in these regions were naturally directed to check the immigration of the Transalpine Celts, and to make the natural wall, which separates the peninsula from the interior of the continent, also its political boundary. That the terror of the Roman name had already penetrated to the adjacent Celtic cantons beyond the Alps, is shown not only by the totally passive attitude which they maintained during the annihilation or subjugation of their Cisalpine countrymen, but still more by the official disapproval and disavowal which the Transalpine cantons—we shall have to think primarily of the Helvetii (between the lake of Geneva and the Main) and the Carni or Taurisci (in Carinthia and Styria)—expressed to the envoys from Rome, who complained of the attempts made by isolated Celtic bands to settle peacefully on the Roman side of the Alps. Not less significant was the humble spirit in which these same bands of emigrants first came to the Roman senate entreating an assignment of land, and then without remonstrance obeyed the rigorous order to return over the Alps (568-575), and allowed the town, which they had already founded not far from the later Aquileia, to be again destroyed. With wise severity the senate permitted no sort of exception to the principle that the gates of the Alps should be henceforth closed for the Celtic nation, and visited with heavy penalties those Roman subjects in Italy, who had instigated any such schemes of immigration. An attempt of this kind which was made on a route hitherto little known to the Romans, in the innermost recess of the Adriatic, and still more, as it would seem, the project of Philip of Macedonia for invading Italy from the east as Hannibal had done from the west, gave occasion to the founding of a fortress in the extreme north-eastern corner of Italy—Aquileia, the most northerly of the Italian colonies (571-573)—which was intended not only to close that route for ever against foreigners, but also to secure the command of the gulf which was specially convenient for navigation, and to check the piracy which was still not wholly extirpated in those waters. The establishment of Aquileia led to a war with the Istrians (576, 577), which was speedily terminated by the storming of some strongholds and the fall of the king, Aepulo, and which was remarkable for nothing except for the panic, which the news of the surprise of the Roman camp by a handful of barbarians called forth in the fleet and throughout Italy.

Colonizing of the Region on the South of the Po

Page 599

A different course was adopted with the region on the south of the Po, which the Roman senate had determined to incorporate with Italy. The Boii, who were immediately affected by this step, defended themselves with the resolution of despair. They even crossed the Po and made an attempt to rouse the Insubres once more to arms (560); they blockaded a consul in his camp, and he was on the point of succumbing; Placentia maintained itself with difficulty against the constant assaults of the exasperated natives. At length the last battle was fought at Mutina; it was long and bloody, but the Romans conquered (561); and thenceforth the struggle was no longer a war, but a slave-hunt. The Roman camp soon was the only asylum in the Boian territory; thither the better part of the still surviving population began to take refuge; and the victors were able, without much exaggeration, to report to Rome that nothing remained of the nation of the Boii but old men and children. The nation was thus obliged to resign itself to the fate appointed for it. The Romans demanded the cession of half the territory (563); the demand could not be refused, and even within the diminished district which was left to the Boii, they soon disappeared, and amalgamated with their conquerors.(1)

After the Romans had thus cleared the ground for themselves, the fortresses of Placentia and Cremona, whose colonists had been in great part swept away or dispersed by the troubles of the last few years, were reorganized, and new settlers were sent thither. The new foundations were, in or near the former territory of the Senones, Potentia (near Recanati not far from Ancona: in 570) and Pisaurum (Pesaro: in 570), and, in the newly acquired district of the Boii, the fortresses of Bononia (565), Mutina (571), and Parma (571); the colony of Mutina had been already instituted before the war under Hannibal, but that war had interrupted the completion of the settlement. The construction of fortresses was associated, as was always the case, with the formation of military roads. The Flaminian way was prolonged from its northern termination at Ariminum, under the name of the Aemilian way, to Placentia (567). Moreover, the road from Rome to Arretium or the Cassian way, which perhaps had already been long a municipal road, was taken in charge and constructed anew by the Roman community probably in 583; while in 567 the track from Arretium over the Apennines to Bononia as far as the new Aemilian road had been put in order, and furnished a shorter communication between Rome and the fortresses on the Po. By these comprehensive measures the Apennines were practically superseded as the boundary between the Celtic and Italian territories, and were replaced by the Po. South of the Po there henceforth prevailed mainly the urban constitution of the Italians, beyond it mainly the cantonal constitution of the Celts; and, if the district between the Apennines and the Po was still reckoned Celtic land, it was but an empty name.

Page 600

Liguria

In the north-western mountain-land of Italy, whose valleys and hills were occupied chiefly by the much-subdivided Ligurian stock, the Romans pursued a similar course. Those dwelling immediately to the north of the Arno were extirpated. This fate befell chiefly the Apuani, who dwelt on the Apennines between the Arno and the Magra, and incessantly plundered on the one side the territory of Pisae, on the other that of Bononia and Mutina. Those who did not fall victims in that quarter to the sword of the Romans were transported into Lower Italy to the region of Beneventum (574); and by energetic measures the Ligurian nation, from which the Romans were obliged in 578 to recover the colony of Mutina which it had conquered, was completely crushed in the mountains which separate the valley of the Po from that of the Arno. The fortress of Luna (not far from Spezzia), established in 577 in the former territory of the Apuani, protected the frontier against the Ligurians just as Aquileia did against the Transalpines, and gave the Romans at the same time an excellent port which henceforth became the usual station for the passage to Massilia and to Spain. The construction of the coast or Aurelian road from Rome to Luna, and of the cross road carried from Luca by way of Florence to Arretium between the Aurelian and Cassian ways, probably belongs to the same period.

With the more western Ligurian tribes, who held the Genoese Apennines and the Maritime Alps, there were incessant conflicts. They were troublesome neighbours, accustomed to pillage by land and by sea: the Pisans and Massiliots suffered no little injury from their incursions and their piracies. But no permanent results were gained amidst these constant hostilities, or perhaps even aimed at; except apparently that, with a view to have a communication by land with Transalpine Gaul and Spain in addition to the regular route by sea, the Romans endeavoured to clear the great coast road from Luna by way of Massilia to Emporiae, at least as far as the Alps—beyond the Alps it devolved on the Massiliots to keep the coast navigation open for Roman vessels and the road along the shore open for travellers by land. The interior with its impassable valleys and its rocky fastnesses, and with its poor but dexterous and crafty inhabitants, served the Romans mainly as a school of war for the training and hardening of soldiers and officers.

Corsica Sardinia

Wars as they are called, of a similar character with those against the Ligurians, were waged with the Corsicans and to a still greater extent with the inhabitants of the interior of Sardinia, who retaliated for the predatory expeditions directed against them by sudden attacks on the districts along the coast. The expedition of Tiberius Gracchus against the Sardinians in 577 was specially held in remembrance, not so much because it gave “peace” to the province, as because he asserted that he had slain or captured as many as 80,000 of the islanders, and dragged slaves thence in such multitudes to Rome that “cheap as a Sardinian” became a proverb.

Page 601

Carthage

In Africa the policy of Rome was substantially summed up in the one idea, as short-sighted as it was narrow-minded, that she ought to prevent the revival of the power of Carthage, and ought accordingly to keep the unhappy city constantly oppressed and apprehensive of a declaration of war suspended over it by Rome like the sword of Damocles. The stipulation in the treaty of peace, that the Carthaginians should retain their territory undiminished, but that their neighbour Massinissa should have all those possessions guaranteed to him which he or his predecessor had possessed within the Carthaginian bounds, looks almost as if it had been inserted not to obviate, but to provoke disputes. The same remark applies to the obligation imposed by the Roman treaty of peace on the Carthaginians not to make war upon the allies of Rome; so that, according to the letter of the treaty, they were not even entitled to expel their Numidian neighbours from their own undisputed territory. With such stipulations and amidst the uncertainty of African frontier questions in general, the situation of Carthage in presence of a neighbour equally powerful and unscrupulous and of a liege lord who was at once umpire and party in the cause, could not but be a painful one; but the reality was worse than the worst expectations. As early as 561 Carthage found herself suddenly assailed under frivolous pretexts, and saw the richest portion of her territory, the province of Emporiae on the Lesser Syrtis, partly plundered by the Numidians, partly even seized and retained by them. Encroachments of this kind were multiplied; the level country passed into the hands of the Numidians, and the Carthaginians with difficulty maintained themselves in the larger places. Within the last two years alone, the Carthaginians declared in 582, seventy villages had been again wrested from them in opposition to the treaty. Embassy after embassy was despatched to Rome; the Carthaginians adjured the Roman senate either to allow them to defend themselves by arms, or to appoint a court of arbitration with power to enforce their award, or to regulate the frontier anew that they might at least learn once for all how much they were to lose; otherwise it were better to make them Roman subjects at once than thus gradually to deliver them over to the Libyans. But the Roman government, which already in 554 had held forth a direct prospect of extension of territory to their client, of course at the expense of Carthage, seemed to have little objection that he should himself take the booty destined for him; they moderated perhaps at times the too great impetuosity of the Libyans, who now retaliated fully on their old tormentors for their former sufferings; but it was in reality for the very sake of inflicting this torture that the Romans had assigned Massinissa as a neighbour to Carthage. All the requests and complaints had no result, except either that Roman commissions made their appearance in Africa and after

Page 602

a thorough investigation came to no decision, or that in the negotiations at Rome the envoys of Massinissa pretended a want of instructions and the matter was adjourned. Phoenician patience alone was able to submit meekly to such a position, and even to exhibit towards the despotic victors every attention and courtesy, solicited or unsolicited with unwearied perseverance. The Carthaginians especially courted Roman favour by sending supplies of grain.

Hannibal
Reform of the Carthaginian Constitution
Hannibal's Flight

This pliability on the part of the vanquished, however was not mere patience and resignation. There was still in Carthage a patriotic party, and at its head stood the man who, wherever fate placed him, was still dreaded by the Romans. It had not abandoned the idea of resuming the struggle by taking advantage of those complications that might be easily foreseen between Rome and the eastern powers; and, as the failure of the magnificent scheme of Hamilcar and his sons had been due mainly to the Carthaginian oligarchy, the chief object was internally to reinvigorate the country for this new struggle. The salutary influence of adversity, and the clear, noble, and commanding mind of Hannibal, effected political and financial reforms. The oligarchy, which had filled up the measure of its guilty follies by raising a criminal process against the great general, charging him with having intentionally abstained from the capture of Rome and with embezzlement of the Italian spoil—that rotten oligarchy was, on the proposition of Hannibal, overthrown, and a democratic government was introduced such as was suited to the circumstances of the citizens (before 559). The finances were so rapidly reorganized by the collection of arrears and of embezzled moneys and by the introduction of better control, that the contribution due to Rome could be paid without burdening the citizens in any way with extraordinary taxes. The Roman government, just then on the point of beginning its critical war with the great-king of Asia, observed the progress of these events, as may easily be conceived, with apprehension; it was no imaginary danger that the Carthaginian fleet might land in Italy and a second war under Hannibal might spring up there, while the Roman legions fighting in Asia Minor. We can scarcely, therefore, censure the Romans for sending an embassy to Carthage (in 559) which was presumably charged to demand the surrender of Hannibal. The spiteful Carthaginian oligarchs, who sent letter after letter to Rome to denounce to the national foe the hero who had overthrown them as having entered into secret communications with the powers unfriendly to Rome, were contemptible, but their information was probably correct; and, true as it was that that embassy involved a humiliating confession of the dread with which the simple shofete of Carthage inspired so powerful a people, and natural and honourable as it was that

Page 603

the proud conqueror of Zama should take exception in the senate to so humiliating a step, still that confession was nothing but the simple truth, and Hannibal was of a genius so extraordinary, that none but sentimental politicians in Rome could tolerate him longer at the head of the Carthaginian state. The marked recognition thus accorded to him by the Roman government scarcely took himself by surprise. As it was Hannibal and not Carthage that had carried on the last war, so it was he who had to bear the fate of the vanquished. The Carthaginians could do nothing but submit and be thankful that Hannibal, sparing them the greater disgrace by his speedy and prudent flight to the east, left to his ancestral city merely the lesser disgrace of having banished its greatest citizen for ever from his native land, confiscated his property, and razed his house. The profound saying that those are the favourites of the gods, on whom they lavish infinite joys and infinite sorrows, thus verified itself in full measure in the case of Hannibal.

Continued Irritation in Rome towards Carthage

A graver responsibility than that arising out of their proceedings against Hannibal attaches to the Roman government for their persistence in suspecting and tormenting the city after his removal. Parties indeed fermented there as before; but, after the withdrawal of the extraordinary man who had wellnigh changed the destinies of the world, the patriot party was not of much more importance in Carthage than in Aetolia or Achaia. The most rational of the various ideas which then agitated the unhappy city was beyond doubt that of attaching themselves to Massinissa and of converting him from the oppressor into the protector of the Phoenicians. But neither the national section of the patriots nor the section with Libyan tendencies attained the helm; on the contrary the government remained in the hands of the oligarchs friendly to Rome, who, so far as they did not altogether renounce thought of the future, clung to the single idea of saving the material welfare and the communal freedom of Carthage under Roman protection. With this state of matters the Romans might well have been content. But neither the multitude, nor even the ruling lords of the average stamp, could rid themselves of the profound alarm produced by the Hannibalic war; and the Roman merchants with envious eyes beheld the city even now, when its political power was gone, possessed of extensive commercial dependencies and of a firmly established wealth which nothing could shake. Already in 567 the Carthaginian government offered to pay up at once the whole instalments stipulated in the peace of 553—an offer which the Romans, who attached far more importance to the having Carthage tributary than to the sums of money themselves, naturally declined, and only deduced from it the conviction that, in spite of all the trouble they had taken, the city was not ruined and was not capable of ruin.

Page 604

Fresh reports were ever circulating through Rome as to the intrigues of the faithless Phoenicians. At one time it was alleged that Aristo of Tyre had been seen in Carthage as an emissary of Hannibal, to prepare the citizens for the landing of an Asiatic war-fleet (561); at another, that the council had, in a secret nocturnal sitting in the temple of the God of Healing, given audience to the envoys of Perseus (581); at another there was talk of the powerful fleet which was being equipped in Carthage for the Macedonian war (583). It is probable that these and similar reports were founded on nothing more than, at most, individual indiscretions; but still they were the signal for new diplomatic ill usage on the part of Rome, and for new aggressions on the part of Massinissa, and the idea gained ground the more, the less sense and reason there was in it, that the Carthaginian question would not be settled without a third Punic war.

Numidians

While the power of the Phoenicians was thus sinking in the land of their choice, just as it had long ago succumbed in their original home, a new state grew up by their side. The northern coast of Africa has been inhabited from time immemorial, and is inhabited still, by the people, who themselves assume the name of Shilah or Tamazigt, whom the Greeks and Romans call Nomades or Numidians, i. e. the “pastoral” people, and the Arabs call Berbers, although they also at times designate them as “shepherds” (Shawie), and to whom we are wont to give the name of Berbers or Kabyles. This people is, so far as its language has been hitherto investigated, related to no other known nation. In the Carthaginian period these tribes, with the exception of those dwelling immediately around Carthage or immediately on the coast, had on the whole maintained their independence, and had also substantially retained their pastoral and equestrian life, such as the inhabitants of the Atlas lead at the present day; although they were not strangers to the Phoenician alphabet and Phoenician civilization generally,(2) and instances occurred in which the Berber sheiks had their sons educated in Carthage and intermarried with the families of the Phoenician nobility. It was not the policy of the Romans to have direct possessions of their own in Africa; they preferred to rear a state there, which should not be of sufficient importance to be able to dispense with Roman protection, and yet should be sufficiently strong to keep down the power of Carthage now that it was restricted to Africa, and to render all freedom of movement impossible for the tortured city. They found what they sought among the native princes. About the time of the Hannibalic war the natives of North Africa were subject to three principal kings, each of whom, according to the custom there, had a multitude of princes bound to follow his banner; Bocchar king of the Mauri, who ruled from the Atlantic Ocean to the river Molochath (now Mluia, on the boundary between Morocco and the French territory);

Page 605

Syphax king of the Massaesyli, who ruled from the last-named point to the “Perforated Promontory,” as it was called (Seba Rus, between Jijeli and Bona), in what are now the provinces of Oran and Algiers; and Massinissa king of the Massyli, who ruled from the Tretum Promontorium to the boundary of Carthage, in what is now the province of Constantine. The most powerful of these, Syphax king of Siga, had been vanquished in the last war between Rome and Carthage and carried away captive to Rome, where he died in captivity. His wide dominions were mainly given to Massinissa; although Vermina the son of Syphax by humble petition recovered a small portion of his father’s territory from the Romans (554), he was unable to deprive the earlier ally of the Romans of his position as the privileged oppressor of Carthage.

Massinissa

Massinissa became the founder of the Numidian kingdom; and seldom has choice or accident hit upon a man so thoroughly fitted for his post. In body sound and supple up to extreme old age; temperate and sober like an Arab; capable of enduring any fatigue, of standing on the same spot from morning to evening, and of sitting four-and-twenty hours on horseback; tried alike as a soldier and a general amidst the romantic vicissitudes of his youth as well as on the battle-fields of Spain, and not less master of the more difficult art of maintaining discipline in his numerous household and order in his dominions; with equal unscrupulousness ready to throw himself at the feet of his powerful protector, or to tread under foot his weaker neighbour; and, in addition to all this, as accurately acquainted with the circumstances of Carthage, where he was educated and had been on familiar terms in the noblest houses, as he was filled with an African bitterness of hatred towards his own and his people’s oppressors, —this remarkable man became the soul of the revival of his nation, which had seemed on the point of perishing, and of whose virtues and faults he appeared as it were a living embodiment. Fortune favoured him, as in everything, so especially in the fact, that it allowed him time for his work. He died in the ninetieth year of his age (516-605), and in the sixtieth year of his reign, retaining to the last the full possession of his bodily and mental powers, leaving behind him a son one year old and the reputation of having been the strongest man and the best and most fortunate king of his age.

Extension and Civilization of Numidia

We have already narrated how purposely and clearly the Romans in their management of African affairs evinced their taking part with Massinissa, and how zealously and constantly the latter availed himself of the tacit permission to enlarge his territory at the expense of Carthage. The whole interior to the border of the desert fell to the native sovereign as it were of its own accord, and even the upper valley of the Bagradas (Mejerdah) with the rich town of Vaga

Page 606

became subject to the king; on the coast also to the east of Carthage he occupied the old Sidonian city of Great Leptis and other districts, so that his kingdom stretched from the Mauretanian to the Cyrenaean frontier, enclosed the Carthaginian territory on every side by land, and everywhere pressed, in the closest vicinity, on the Phoenicians. It admits of no doubt, that he looked on Carthage as his future capital; the Libyan party there was significant. But it was not only by the diminution of her territory that Carthage suffered injury. The roving shepherds were converted by their great king into another people. After the example of the king, who brought the fields under cultivation far and wide and bequeathed to each of his sons considerable landed estates, his subjects also began to settle and to practise agriculture. As he converted his shepherds into settled citizens, he converted also his hordes of plunderers into soldiers who were deemed by Rome worthy to fight side by side with her legions; and he bequeathed to his successors a richly-filled treasury, a well-disciplined army, and even a fleet. His residence Cirta (Constantine) became the stirring capital of a powerful state, and a chief seat of Phoenician civilization, which was zealously fostered at the court of the Berber king—fostered perhaps studiously with a view to the future Carthagino-Numidian kingdom. The hitherto degraded Libyan nationality thus rose in its own estimation, and the native manners and language made their way even into the old Phoenician towns, such as Great Leptis. The Berber began, under the aegis of Rome, to feel himself the equal or even the superior of the Phoenician; Carthaginian envoys at Rome had to submit to be told that they were aliens in Africa, and that the land belonged to the Libyans. The Phoenico-national civilization of North Africa, which still retained life and vigour even in the levelling times of the Empire, was far more the work of Massinissa than of the Carthaginians.

The State of Culture in Spain

In Spain the Greek and Phoenician towns along the coast, such as Emporiae, Saguntum, New Carthage, Malaca, and Gades, submitted to the Roman rule the more readily, that, left to their own resources, they would hardly have been able to protect themselves from the natives; as for similar reasons Massilia, although far more important and more capable of self-defence than those towns, did not omit to secure a powerful support in case of need by closely attaching itself to the Romans, to whom it was in return very serviceable as an intermediate station between Italy and Spain. The natives, on the other hand, gave to the Romans endless trouble. It is true that there were not wanting the rudiments of a national Iberian civilization, although of its special character it is scarcely possible for us to acquire any clear idea. We find among the Iberians a widely diffused national writing, which divides itself into two chief kinds, that of the valley of

Page 607

the Ebro, and the Andalusian, and each of these was presumably subdivided into various branches: this writing seems to have originated at a very early period, and to be traceable rather to the old Greek than to the Phoenician alphabet. There is even a tradition that the Turdetani (round Seville) possessed lays from very ancient times, a metrical book of laws of 6000 verses, and even historical records; at any rate this tribe is described as the most civilized of all the Spanish tribes, and at the same time the least warlike; indeed, it regularly carried on its wars by means of foreign mercenaries. To the same region probably we must refer the descriptions given by Polybius of the flourishing condition of agriculture and the rearing of cattle in Spain—so that, in the absence of opportunity of export, grain and flesh were to be had at nominal prices—and of the splendid royal palaces with golden and silver jars full of “barley wine.” At least a portion of the Spaniards, moreover, zealously embraced the elements of culture which the Romans brought along with them, so that the process of Latinizing made more rapid progress in Spain than anywhere else in the transmarine provinces. For example, warm baths after the Italian fashion came into use even at this period among the natives. Roman money, too, was to all appearance not only current in Spain far earlier than elsewhere out of Italy, but was imitated in Spanish coins; a circumstance in some measure explained by the rich silver-mines of the country. The so-called “silver of Osca” (now Huesca in Arragon), i. e. Spanish -denarii- with Iberian inscriptions, is mentioned in 559; and the commencement of their coinage cannot be placed much later, because the impression is imitated from that of the oldest Roman -denarii-.

But, while in the southern and eastern provinces the culture of the natives may have so far prepared the way for Roman civilization and Roman rule that these encountered no serious difficulties, the west and north on the other hand, and the whole of the interior, were occupied by numerous tribes more or less barbarous, who knew little of any kind of civilization—in Intercatia, for instance, the use of gold and silver was still unknown about 600—and who were on no better terms with each other than with the Romans. A characteristic trait in these free Spaniards was the chivalrous spirit of the men and, at least to an equal extent, of the women. When a mother sent forth her son to battle, she roused his spirit by the recital of the feats of his ancestors; and the fairest maiden unasked offered her hand in marriage to the bravest man. Single combat was common, both with a view to determine the prize of valour, and for the settlement of lawsuits; even disputes among the relatives of princes as to the succession were settled in this way. It not unfrequently happened that a well-known warrior confronted the ranks of the enemy and challenged an antagonist by name; the defeated champion then surrendered his mantle

Page 608

and sword to his opponent, and even entered into relations of friendship and hospitality with him. Twenty years after the close of the second Punic war, the little Celtiberian community of Complega (in the neighbourhood of the sources of the Tagus) sent a message to the Roman general, that unless he sent to them for every man that had fallen a horse, a mantle, and a sword, it would fare ill with him. Proud of their military honour, so that they frequently could not bear to survive the disgrace of being disarmed, the Spaniards were nevertheless disposed to follow any one who should enlist their services, and to stake their lives in any foreign quarrel. The summons was characteristic, which a Roman general well acquainted with the customs of the country sent to a Celtiberian band righting in the pay of the Turdetani against the Romans—either to return home, or to enter the Roman service with double pay, or to fix time and place for battle. If no recruiting officer made his appearance, they met of their own accord in free bands, with the view of pillaging the more peaceful districts and even of capturing and occupying towns, quite after the manner of the Campanians. The wildness and insecurity of the inland districts are attested by the fact that banishment into the interior westward of Cartagena was regarded by the Romans as a severe punishment, and that in periods of any excitement the Roman commandants of Further Spain took with them escorts of as many as 6000 men. They are still more clearly shown by the singular relations subsisting between the Greeks and their Spanish neighbours in the Graeco-Spanish double city of Emporiae, at the eastern extremity of the Pyrenees. The Greek settlers, who dwelt on the point of the peninsula separated on the landward side from the Spanish part of the town by a wall, took care that this wall should be guarded every night by a third of their civic force, and that a higher official should constantly superintend the watch at the only gate; no Spaniard was allowed to set foot in the Greek city, and the Greeks conveyed their merchandise to the natives only in numerous and well-escorted companies.

Wars between the Romans and Spaniards

These natives, full of restlessness and fond of war—full of the spirit of the Cid and of Don Quixote—were now to be tamed and, if possible, civilized by the Romans. In a military point of view the task was not difficult. It is true that the Spaniards showed themselves, not only when behind the walls of their cities or under the leadership of Hannibal, but even when left to themselves and in the open field of battle, no contemptible opponents; with their short two-edged sword which the Romans subsequently adopted from them, and their formidable assaulting columns, they not unfrequently made even the Roman legions waver. Had they been able to submit to military discipline and to political combination, they might perhaps have shaken off the foreign yoke imposed on

Page 609

them. But their valour was rather that of the guerilla than of the soldier, and they were utterly void of political judgment. Thus in Spain there was no serious war, but as little was there any real peace; the Spaniards, as Caesar afterwards very justly pointed out to them, never showed themselves quiet in peace or strenuous in war. Easy as it was for a Roman general to scatter a host of insurgents, it was difficult for the Roman statesman to devise any suitable means of really pacifying and civilizing Spain. In fact, he could only deal with it by palliative measures; because the only really adequate expedient, a comprehensive Latin colonization, was not accordant with the general aim of Roman policy at this period.

The Romans Maintain a Standing Army in Spain

Cato

Gracchus

The territory which the Romans acquired in Spain in the course of the second Punic war was from the beginning divided into two masses—the province formerly Carthaginian, which embraced in the first instance the present districts of Andalusia, Granada, Murcia, and Valencia, and the province of the Ebro, or the modern Arragon and Catalonia, the fixed quarters of the Roman army during the last war. Out of these territories were formed the two Roman provinces of Further and Hither Spain. The Romans sought gradually to reduce to subjection the interior corresponding nearly to the two Castiles, which they comprehended under the general name of Celtiberia, while they were content with checking the incursions of the inhabitants of the western provinces, more especially those of the Lusitanians in the modern Portugal and the Spanish Estremadura, into the Roman territory; with the tribes on the north coast, the Callaecians, Asturians, and Cantabrians, they did not as yet come into contact at all. The territories thus won, however, could not be maintained and secured without a standing garrison, for the governor of Hither Spain had no small trouble every year with the chastisement of the Celtiberians, and the governor of the more remote province found similar employment in repelling the Lusitanians. It was needful accordingly to maintain in Spain a Roman army of four strong legions, or about 40,000 men, year after year; besides which the general levy had often to be called out in the districts occupied by Rome, to reinforce the legions. This was of great importance for two reasons: it was in Spain first, at least first on any larger scale, that the military occupation of the land became continuous; and it was there consequently that the service acquired a permanent character. The old Roman custom of sending troops only where the exigencies of war at the moment required them, and of not keeping the men called to serve, except in very serious and important wars, under arms for more than a year, was found incompatible with the retention of the turbulent and remote Spanish provinces beyond the sea; it was absolutely impossible to withdraw the troops from these, and very dangerous

Page 610

even to relieve them extensively. The Roman burgesses began to perceive that dominion over a foreign people is an annoyance not only to the slave, but to the master, and murmured loudly regarding the odious war-service of Spain. While the new generals with good reason refused to allow the relief of the existing corps as a whole, the men mutinied and threatened that, if they were not allowed their discharge, they would take it of their own accord.

The wars themselves, which the Romans waged in Spain, were but of a subordinate importance. They began with the very departure of Scipio,(3) and continued as long as the war under Hannibal lasted. After the peace with Carthage (in 553) there was a cessation of arms in the peninsula; but only for a short time. In 557 a general insurrection broke out in both provinces; the commander of the Further province was hard pressed; the commander of Hither Spain was completely defeated, and was himself slain. It was necessary to take up the war in earnest, and although in the meantime the able praetor Quintus Minucius had mastered the first danger, the senate resolved in 559 to send the consul Marcus Cato in person to Spain. On landing at Emporiae he actually found the whole of Hither Spain overrun by the insurgents; with difficulty that seaport and one or two strongholds in the interior were still held for Rome. A pitched battle took place between the insurgents and the consular army, in which, after an obstinate conflict man against man, the Roman military skill at length decided the day with its last reserve. The whole of Hither Spain thereupon sent in its submission: so little, however, was this submission meant in earnest, that on a rumour of the consul having returned to Rome the insurrection immediately recommenced. But the rumour was false; and after Cato had rapidly reduced the communities which had revolted for the second time and sold them -en masse- into slavery, he decreed a general disarming of the Spaniards in the Hither province, and issued orders to all the towns of the natives from the Pyrenees to the Guadalquivir to pull down their walls on one and the same day. No one knew how far the command extended, and there was no time to come to any understanding; most of the communities complied; and of the few that were refractory not many ventured, when the Roman army soon appeared before their walls, to await its assault.

These energetic measures were certainly not without permanent effect. Nevertheless the Romans had almost every year to reduce to subjection some mountain valley or mountain stronghold in the "peaceful province," and the constant incursions of the Lusitanians into the Further province led occasionally to severe defeats of the Romans. In 563, for instance, a Roman army was obliged after heavy loss to abandon its camp, and to return by forced marches into the more tranquil districts. It was not till after a victory gained by the praetor Lucius

Page 611

Aemilius Paullus in 565,(4) and a second still more considerable gained by the brave praetor Gaius Calpurnius beyond the Tagus over the Lusitanians in 569, that quiet for some time prevailed. In Hither Spain the hitherto almost nominal rule of the Romans over the Celtiberian tribes was placed on a firmer basis by Quintus Fulvius Flaccus, who after a great victory over them in 573 compelled at least the adjacent cantons to submission; and especially by his successor Tiberius Gracchus (575, 576), who achieved results of a permanent character not only by his arms, by which he reduced three hundred Spanish townships, but still more by his adroitness in adapting himself to the views and habits of the simple and haughty nation. He induced Celtiberians of note to take service in the Roman army, and so created a class of dependents; he assigned land to the roving tribes, and collected them in towns—the Spanish town Graccurre preserved the Roman's name—and so imposed a serious check on their freebooter habits; he regulated the relations of the several tribes to the Romans by just and wise treaties, and so stopped, as far as possible, the springs of future rebellion. His name was held in grateful remembrance by the Spaniards, and comparative peace henceforth reigned in the land, although the Celtiberians still from time to time winced under the yoke.

Administration of Spain

The system of administration in the two Spanish provinces was similar to that of the Sicilo-Sardinian province, but not identical. The superintendence was in both instances vested in two auxiliary consuls, who were first nominated in 557, in which year also the regulation of the boundaries and the definitive organization of the new provinces took place. The judicious enactment of the Baebian law (573), that the Spanish praetors should always be nominated for two years, was not seriously carried out in consequence of the increasing competition for the highest magistracies, and still more in consequence of the jealous supervision exercised over the powers of the magistrates by the senate; and in Spain also, except where deviations occurred in extraordinary circumstances, the Romans adhered to the system of annually changing the governors—a system especially injudicious in the case of provinces so remote and with which it was so difficult to gain an acquaintance. The dependent communities were throughout tributary; but, instead of the Sicilian and Sardinian tenths and customs, in Spain fixed payments in money or other contributions were imposed by the Romans, just as formerly by the Carthaginians, on the several towns and tribes: the collection of these by military means was prohibited by a decree of the senate in 583, in consequence of the complaints of the Spanish communities. Grain was not furnished in their case except for compensation, and even then the governor might not levy more than a twentieth; besides, conformably to the just-mentioned ordinance

Page 612

of the supreme authority, he was bound to adjust the compensation in an equitable manner. On the other hand, the obligation of the Spanish subjects to furnish contingents to the Roman armies had an importance very different from that which belonged to it at least in peaceful Sicily, and it was strictly regulated in the several treaties. The right, too, of coining silver money of the Roman standard appears to have been very frequently conceded to the Spanish towns, and the monopoly of coining seems to have been by no means asserted here by the Roman government with the same strictness as in Sicily. Rome had too much need of her subjects everywhere in Spain, not to proceed with all possible tenderness in the introduction and handling of the provincial constitution there. Among the communities specially favoured by Rome were the great cities along the coast of Greek, Phoenician, or Roman foundation, such as Saguntum, Gades, and Tarraco, which, as the natural pillars of the Roman rule in the peninsula, were admitted to alliance with Rome. On the whole, Spain was in a military as well as financial point of view a burden rather than a gain to the Roman commonwealth; and the question naturally occurs, Why did the Roman government, whose policy at that time evidently did not contemplate the acquisition of countries beyond the sea, not rid itself of these troublesome possessions? The not inconsiderable commercial connections of Spain, her important iron-mines, and her still more important silver-mines famous from ancient times even in the far east⁽⁵⁾—which Rome, like Carthage, took into her own hands, and the management of which was specially regulated by Marcus Cato (559)—must beyond doubt have co-operated to induce its retention; but the chief reason of the Romans for retaining the peninsula in their own immediate possession was, that there were no states in that quarter of similar character to the Massiliot republic in the land of the Celts and the Numidian kingdom in Libya, and that thus they could not abandon Spain without putting it into the power of any adventurer to revive the Spanish empire of the Barcides.

Notes for Chapter VII

1. According to the account of Strabo these Italian Boii were driven by the Romans over the Alps, and from them proceeded that Boian settlement in what is now Hungary about Stein am Anger and Oedenburg, which was attacked and annihilated in the time of Augustus by the Getae who crossed the Danube, but which bequeathed to this district the name of the Boian desert. This account is far from agreeing with the well-attested representation of the Roman annals, according to which the Romans were content with the cession of half the territory; and, in order to explain the disappearance of the Italian Boii, we have really no need to assume a violent expulsion—the other Celtic peoples, although visited to a far less extent by war and colonization,

Page 613

disappeared not much less rapidly and totally from the ranks of the Italian nations. On the other hand, other accounts suggest the derivation of those Boii on the Neusiedler See from the main stock of the nation, which formerly had its seat in Bavaria and Bohemia before Germanic tribes pushed it towards the south. But it is altogether very doubtful whether the Boii, whom we find near Bordeaux, on the Po, and in Bohemia, were really scattered branches of one stock, or whether this is not an instance of mere similarity of name. The hypothesis of Strabo may have rested on nothing else than an inference from the similarity of name—an inference such as the ancients drew, often without due reason, in the case of the Cimbri, Veneti, and others.

2. III. I. Libyphoenicians

3. III. Vi. Gades Becomes Roman

4. Of this praetor there has recently come to light the following decree on a copper tablet found in the neighbourhood of Gibraltar and now preserved in the Paris Museum: "L. Aimilius, son of Lucius, Imperator, has ordained that the slaves of the Hastenses [of Hasta regia, not far from Jerez de la Frontera], who dwell in the tower of Lascuta [known by means of coins and Plin. iii. i, 15, but uncertain as to site] should be free. The ground and the township, of which they are at the time in possession, they shall continue to possess and hold, so long as it shall please the people and senate of the Romans. Done in camp on 12 Jan. [564 or 565]." (-L. Aimilius L. f. inpeirator decreivit utei qui Hastensium servei in turri Lascutana habitarent, leiberei essent, Agrum oppidumqu[e], quod ea tempestate posedissent, item possidere habereque ioussit, dum populus senatusque Romanus vettet. Act. in castreis a. d. XII. k. Febr.-) This is the oldest Roman document which we possess in the original, drawn up three years earlier than the well-known edict of the consuls of the year 568 in the affair of the Bacchanalia.

5. 1 Maccab. viii. 3. "And Judas heard what the Romans had done to the land of Hispania to become masters of the silver and gold mines there."

CHAPTER VIII

The Eastern States and the Second Macedonian War

The Hellenic East

The work, which Alexander king of Macedonia had begun a century before the Romans acquired their first footing in the territory which he had called his own, had in the course of time—while adhering substantially to the great fundamental idea of Hellenizing the east—changed and expanded into the construction of a system of Hellene-Asiatic

states. The unconquerable propensity of the Greeks for migration and colonizing, which had formerly carried their traders to Massilia and Cyrene, to the Nile and to the Black Sea, now firmly held what the king had won; and under the protection of the -sarissae-, Greek civilization peacefully domiciled itself everywhere throughout the ancient empire of the Achaemenidae. The officers, who divided the heritage of the great general, gradually settled their differences, and a system of equilibrium was established, of which the very Oscillations manifest some sort of regularity.

Page 614

The Great States Macedonia

Of the three states of the first rank belonging to this system —Macedonia, Asia, and Egypt—Macedonia under Philip the Fifth, who had occupied the throne since 534, was externally at least very much what it had been under Philip the Second the father of Alexander —a compact military state with its finances in good order. On its northern frontier matters had resumed their former footing, after the waves of the Gallic inundation had rolled away; the guard of the frontier kept the Illyrian barbarians in check without difficulty, at least in ordinary times. In the south, not only was Greece in general dependent on Macedonia, but a large portion of it—including all Thessaly in its widest sense from Olympus to the Spercheius and the peninsula of Magnesia, the large and important island of Euboea, the provinces of Locris, Phocis, and Doris, and lastly, a number of isolated positions in Attica and in the Peloponnesus, such as the promontory of Sunium, Corinth, Orchomenus, Heraea, the Triphylian territory—was directly subject to Macedonia and received Macedonian garrisons; more especially the three important fortresses of Demetrias in Magnesia, Chalcis in Euboea, and Corinth, “the three fetters of the Hellenes.” But the strength of the state lay above all in its hereditary soil, the province of Macedonia. The population, indeed, of that extensive territory was remarkably scanty; Macedonia, putting forth all her energies, was scarcely able to bring into the field as many men as were contained in an ordinary consular army of two legions; and it was unmistakeably evident that the land had not yet recovered from the depopulation occasioned by the campaigns of Alexander and by the Gallic invasion. But while in Greece proper the moral and political energy of the people had decayed, the day of national vigour seemed to have gone by, life appeared scarce worth living for, and even of the better spirits one spent time over the wine-cup, another with the rapier, a third beside the student’s lamp; while in the east and Alexandria the Greeks were able perhaps to disseminate elements of culture among the dense native population and to diffuse among that population their language and their loquacity, their science and pseudo-science, but were barely sufficient in point of number to supply the nations with officers, statesmen, and schoolmasters, and were far too few to form even in the cities middle-class of the pure Greek type; there still existed, on the other hand, in northern Greece a goodly portion of the old national vigour, which had produced the warriors of Marathon. Hence arose the confidence with which the Macedonians, Aetolians, and Acarnanians, wherever they made their appearance in the east, claimed to be, and were taken as, a better race; and hence the superior part which they played at the courts of Alexandria and Antioch. There is a characteristic story, that an Alexandrian who had lived for a considerable time in Macedonia

Page 615

and had adopted the manners and the dress of that country, on returning to his native city, now looked upon himself as a man and upon the Alexandrians as little better than slaves. This sturdy vigour and unimpaired national spirit were turned to peculiarly good account by the Macedonians, as the most powerful and best organized of the states of northern Greece. There, no doubt, absolutism had emerged in opposition to the old constitution, which to some extent recognized different estates; but sovereign and subject by no means stood towards each other in Macedonia as they stood in Asia and Egypt, and the people still felt itself independent and free. In steadfast resistance to the public enemy under whatever name, in unshaken fidelity towards their native country and their hereditary government, and in persevering courage amidst the severest trials, no nation in ancient history bears so close a resemblance to the Roman people as the Macedonians; and the almost miraculous regeneration of the state after the Gallic invasion redounds to the imperishable honour of its leaders and of the people whom they led.

Asia

The second of the great states, Asia, was nothing but Persia superficially remodelled and Hellenized—the empire of “the king of kings,” as its master was wont to call himself in a style characteristic at once of his arrogance and of his weakness—with the same pretensions to rule from the Hellespont to the Punjab, and with the same disjointed organization; an aggregate of dependent states in various degrees of dependence, of insubordinate satrapies, and of half-free Greek cities. In Asia Minor more especially, which was nominally included in the empire of the Seleucidae, the whole north coast and the greater part of the eastern interior were practically in the hands of native dynasties or of the Celtic hordes that had penetrated thither from Europe; a considerable portion of the west was in the possession of the kings of Pergamus, and the islands and coast towns were some of them Egyptian, some of them free; so that little more was left to the great-king than the interior of Cilicia, Phrygia, and Lydia, and a great number of titular claims, not easily made good, against free cities and princes—exactly similar in character to the sovereignty of the German emperor, in his day, beyond his hereditary dominions. The strength of the empire was expended in vain endeavours to expel the Egyptians from the provinces along the coast; in frontier strife with the eastern peoples, the Parthians and Bactrians; in feuds with the Celts, who to the misfortune of Asia Minor had settled within its bounds; in constant efforts to check the attempts of the eastern satraps and of the Greek cities of Asia Minor to achieve their independence; and in family quarrels and insurrections of pretenders. None indeed of the states founded by the successors of Alexander were free from such attempts, or from the other horrors which absolute monarchy in degenerate times brings in its train; but in the kingdom of Asia these evils were more injurious than elsewhere, because, from the lax composition of the empire, they usually led to the severance of particular portions from it for longer or shorter periods.

Page 616

Egypt

In marked contrast to Asia, Egypt formed a consolidated and united state, in which the intelligent statecraft of the first Lagidae, skilfully availing itself of ancient national and religious precedent, had established a completely absolute cabinet government, and in which even the worst misrule failed to provoke any attempt either at emancipation or disruption. Very different from the Macedonians, whose national attachment to royalty was based upon their personal dignity and was its political expression, the rural population in Egypt was wholly passive; the capital on the other hand was everything, and that capital was a dependency of the court. The remissness and indolence of its rulers, accordingly, paralyzed the state in Egypt still more than in Macedonia and in Asia; while on the other hand when wielded by men, like the first Ptolemy and Ptolemy Euergetes, such a state machine proved itself extremely useful. It was one of the peculiar advantages of Egypt as compared with its two great rivals, that its policy did not grasp at shadows, but pursued clear and attainable objects. Macedonia, the home of Alexander, and Asia, the land where he had established his throne, never ceased to regard themselves as direct continuations of the Alexandrine monarchy and more or less loudly asserted their claim to represent it at least, if not to restore it. The Lagidae never tried to found a universal empire, and never dreamt of conquering India; but, by way of compensation, they drew the whole traffic between India and the Mediterranean from the Phoenician ports to Alexandria, and made Egypt the first commercial and maritime state of this epoch, and the mistress of the eastern Mediterranean and of its coasts and islands. It is a significant fact, that Ptolemy *iii*. Euergetes voluntarily restored all his conquests to Seleucus Callinicus except the seaport of Antioch. Partly by this means, partly by its favourable geographical situation, Egypt attained, with reference to the two continental powers, an excellent military position either for defence or for attack. While an opponent even in the full career of success was hardly in a position seriously to threaten Egypt, which was almost inaccessible on any side to land armies, the Egyptians were able by sea to establish themselves not only in Cyrene, but also in Cyprus and the Cyclades, on the Phoenico-Syrian coast, on the whole south and west coast of Asia Minor and even in Europe on the Thracian Chersonese. By their unexampled skill in turning to account the fertile valley of the Nile for the direct benefit of the treasury, and by a financial system—equally sagacious and unscrupulous—earnestly and adroitly calculated to foster material interests, the court of Alexandria was constantly superior to its opponents even as a moneyed power. Lastly, the intelligent munificence, with which the Lagidae welcomed the tendency of the age towards earnest inquiry in all departments of enterprise and of knowledge,

Page 617

and knew how to confine such inquiries within the bounds, and entwine them with the interests, of absolute monarchy, was productive of direct advantage to the state, whose ship-building and machine-making showed traces of the beneficial influence of Alexandrian mathematics; and not only so, but also rendered this new intellectual power—the most important and the greatest, which the Hellenic nation after its political dismemberment put forth—subservient, so far as it would consent to be serviceable at all, to the Alexandrian court. Had the empire of Alexander continued to stand, Greek science and art would have found a state worthy and capable of containing them. Now, when the nation had fallen to pieces, a learned cosmopolitanism grew up in it luxuriantly, and was very soon attracted by the magnet of Alexandria, where scientific appliances and collections were inexhaustible, where kings composed tragedies and ministers wrote commentaries on them, and where pensions and academies flourished.

The mutual relations of the three great states are evident from what has been said. The maritime power, which ruled the coasts and monopolized the sea, could not but after the first great success—the political separation of the European from the Asiatic continent—direct its further efforts towards the weakening of the two great states on the mainland, and consequently towards the protection of the several minor states; whereas Macedonia and Asia, while regarding each other as rivals, recognized above all their common adversary in Egypt, and combined, or at any rate ought to have combined, against it.

The Kingdoms of Asia Minor

Among the states of the second rank, merely an indirect importance, so far as concerned the contact of the east with the west, attached in the first instance to that series of states which, stretching from the southern end of the Caspian Sea to the Hellespont, occupied the interior and the north coast of Asia Minor: Atropatene (in the modern Aderbijan, south-west of the Caspian), next to it Armenia, Cappadocia in the interior of Asia Minor, Pontus on the south-east, and Bithynia on the south-west, shore of the Black Sea. All of these were fragments of the great Persian Empire, and were ruled by Oriental, mostly old Persian, dynasties—the remote mountain-land of Atropatene in particular was the true asylum of the ancient Persian system, over which even the expedition of Alexander had swept without leaving a trace—and all were in the same relation of temporary and superficial dependence on the Greek dynasty, which had taken or wished to take the place of the great-kings in Asia.

The Celts of Asia Minor

Page 618

Of greater importance for the general relations was the Celtic state in the interior of Asia Minor. There, intermediate between Bithynia, Paphlagonia, Cappadocia, and Phrygia, three Celtic tribes —the Tolistoagii, the Tectosages, and Troceni—had settled, without abandoning either their native language and manners or their constitution and their trade as freebooters. The twelve tetrarchs, one of whom was appointed to preside over each of the four cantons in each of the three tribes, formed, with their council of 300 men, the supreme authority of the nation, and assembled at the “holy place” (-Drunemetum-), especially for the pronouncing of capital sentences. Singular as this cantonal constitution of the Celts appeared to the Asiatics, equally strange seemed to them the adventurous and marauding habits of the northern intruders, who on the one hand furnished their unwarlike neighbours with mercenaries for every war, and on the other plundered on their own account or levied contributions from the surrounding districts. These rude but vigorous barbarians were the general terror of the effeminate surrounding nations, and even of the great-kings of Asia themselves, who, after several Asiatic armies had been destroyed by the Celts and king Antiochus I. Soter had even lost his life in conflict with them (493), agreed at last to pay them tribute.

Pergamus

In consequence of bold and successful opposition to these Gallic hordes, Attalus, a wealthy citizen of Pergamus, received the royal title from his native city and bequeathed it to his posterity. This new court was in miniature what that of Alexandria was on a great scale. Here too the promotion of material interests and the fostering of art and literature formed the order of the day, and the government pursued a cautious and sober cabinet policy, the main objects of which were the weakening the power of its two dangerous continental neighbours, and the establishing an independent Greek state in the west of Asia Minor. A well-filled treasury contributed greatly to the importance of these rulers of Pergamus. They advanced considerable sums to the kings of Syria, the repayment of which afterwards formed part of the Roman conditions of peace. They succeeded even in acquiring territory in this way; Aegina, for instance, which the allied Romans and Aetolians had wrested in the last war from Philip's allies, the Achaeans, was sold by the Aetolians, to whom it fell in terms of the treaty, to Attalus for 30 talents (7300 pounds). But, notwithstanding the splendour of the court and the royal title, the commonwealth of Pergamus always retained something of the urban character; and in its policy it usually went along with the free cities. Attalus himself, the Lorenzo de' Medici of antiquity, remained throughout life a wealthy burgher; and the family life of the Attalid house, from which harmony and cordiality were not banished by the royal title, formed a striking contrast to the dissolute and scandalous behaviour of more aristocratic dynasties.

Page 619

Greece
Epirots, Acarnanians, Boeotians

In European Greece—exclusive of the Roman possessions on the west coast, in the most important of which, particularly Corcyra, Roman magistrates appear to have resided,(1) and the territory directly subject to Macedonia—the powers more or less in a position to pursue a policy of their own were the Epirots, Acarnanians, and Aetolians in northern Greece, the Boeotians and Athenians in central Greece, and the Achaeans, Lacedaemonians, Messenians, and Eleans in the Peloponnesus. Among these, the republics of the Epirots, Acarnanians, and Boeotians were in various ways closely knit to Macedonia—the Acarnanians more especially, because it was only Macedonian protection that enabled them to escape the destruction with which they were threatened by the Aetolians; none of them were of any consequence. Their internal condition was very various. The state of things may to some extent be illustrated by the fact, that among the Boeotians—where, it is true, matters reached their worst—it had become customary to make over every property, which did not descend to heirs in the direct line, to the -syssitia-; and, in the case of candidates for the public magistracies, for a quarter of a century the primary condition of election was that they should bind themselves not to allow any creditor, least of all a foreign one, to sue his debtor.

The Athenians

The Athenians were in the habit of receiving support against Macedonia from Alexandria, and were in close league with the Aetolians. But they too were totally powerless, and hardly anything save the halo of Attic poetry and art distinguished these unworthy successors of a glorious past from a number of petty towns of the same stamp.

The Aetolians

The power of the Aetolian confederacy manifested a greater vigour. The energy of the northern Greek character was still unbroken there, although it had degenerated into a reckless impatience of discipline and control. It was a public law in Aetolia, that an Aetolian might serve as a mercenary against any state, even against a state in alliance with his own country; and, when the other Greeks urgently besought them to redress this scandal, the Aetolian diet declared that Aetolia might sooner be removed from its place than this principle from their national code. The Aetolians might have been of great service to the Greek nation, had they not inflicted still greater injury on it by this system of organized robbery, by their thorough hostility to the Achaean confederacy, and by their unhappy antagonism to the great state of Macedonia.

The Achaeans

In the Peloponnesus, the Achaean league had united the best elements of Greece proper in a confederacy based on civilization, national spirit, and peaceful preparation for self-defence. But the vigour and more especially the military efficiency of the league had, notwithstanding its outward enlargement, been arrested by the selfish diplomacy of Aratus. The unfortunate variances with Sparta, and the still more lamentable invocation of Macedonian interference in the Peloponnesus, had so completely subjected the Achaean league to Macedonian supremacy, that the chief fortresses of the country thenceforward received Macedonian garrisons, and the oath of fidelity to Philip was annually taken there.

Page 620

Sparta, Elis, Messene

The policy of the weaker states in the Peloponnesus, Messene, and Sparta, was determined by their ancient enmity to the Achaean league —an enmity specially fostered by disputes regarding their frontiers —and their tendencies were Aetolian and anti-Macedonian, because the Achaeans took part with Philip. The only one of these states possessing any importance was the Spartan military monarchy, which after the death of Machanidas had passed into the hands of one Nabis. With ever-increasing hardihood Nabis leaned on the support of vagabonds and itinerant mercenaries, to whom he assigned not only the houses and lands, but also the wives and children, of the citizens; and he assiduously maintained connections, and even entered into an association for the joint prosecution of piracy, with the great refuge of mercenaries and pirates, the island of Crete, where he possessed some townships. His predatory expeditions by land, and the piratical vessels which he maintained at the promontory of Malea, were dreaded far and wide; he was personally hated for his baseness and cruelty; but his rule was extending, and about the time of the battle of Zama he had even succeeded in gaining possession of Messene.

League of the Greek Cities
Rhodes

Lastly, the most independent position among the intermediate states was held by the free Greek mercantile cities on the European shore of the Propontis as well as along the whole coast of Asia Minor, and on the islands of the Aegean Sea; they formed, at the same time, the brightest elements in the confused and multifarious picture which was presented by the Hellenic state-system. Three of them, in particular, had after Alexander's death again enjoyed their full freedom, and by the activity of their maritime commerce had attained to respectable political power and even to considerable territorial possessions; namely, Byzantium the mistress of the Bosphorus, rendered wealthy and powerful by the transit dues which she levied and by the important corn trade carried on with the Black Sea; Cyzicus on the Asiatic side of the Propontis, the daughter and heiress of Miletus, maintaining the closest relations with the court of Pergamus; and lastly and above all, Rhodes. The Rhodians, who immediately after the death of Alexander had expelled the Macedonian garrison had, by their favourable position for commerce and navigation, secured the carrying trade of all the eastern Mediterranean; and their well-handled fleet, as well as the tried courage of the citizens in the famous siege of 450, enabled them in that age of promiscuous and ceaseless hostilities to become the prudent and energetic representatives and, when occasion required, champions of a neutral commercial policy. They compelled the Byzantines, for instance, by force of arms to concede to the vessels of Rhodes exemption from dues in the Bosphorus; and they did not permit the dynast of Pergamus to close the Black Sea.

Page 621

On the other hand they kept themselves, as far as possible, aloof from land warfare, although they had acquired no inconsiderable possessions on the opposite coast of Caria; where war could not be avoided, they carried it on by means of mercenaries. With their neighbours on all sides they were in friendly relations—with Syracuse, Macedonia, Syria, but more especially with Egypt—and they enjoyed high consideration at these courts, so that their mediation was not unfrequently invoked in the wars of the great states. But they interested themselves quite specially on behalf of the Greek maritime cities, which were so numerous spread along the coasts of the kingdoms of Pontus, Bithynia, and Pergamus, as well as on the coasts and islands of Asia Minor that had been wrested by Egypt from the Seleucidae; such as Sinope, Heraclea Pontica, Cius, Lampsacus, Abydos, Mitylene, Chios, Smyrna, Samos, Halicarnassus and various others. All these were in substance free and had nothing to do with the lords of the soil except to ask for the confirmation of their privileges and, at most, to pay a moderate tribute: such encroachments, as from time to time were threatened by the dynasts, were skilfully warded off sometimes by cringing, sometimes by strong measures. In this case the Rhodians were their chief auxiliaries; they emphatically supported Sinope, for instance, against Mithradates of Pontus. How firmly amidst the quarrels, and by means of the very differences, of the monarchs the liberties of these cities of Asia Minor were established, is shown by the fact, that the dispute between Antiochus and the Romans some years after this time related not to the freedom of these cities in itself, but to the question whether they were to ask confirmation of their charters from the king or not. This league of the cities was, in this peculiar attitude towards the lords of the soil as well as in other respects, a formal Hanseatic association, headed by Rhodes, which negotiated and stipulated in treaties for itself and its allies. This league upheld the freedom of the cities against monarchical interests; and while wars raged around their walls, public spirit and civic prosperity were sheltered in comparative peace within, and art and science flourished without the risk of being crushed by a dissolute soldiery or corrupted by the atmosphere of a court.

Philip, King of Macedonia

Such was the state of things in the east, at the time when the wall of political separation between the east and the west was broken down and the eastern powers, Philip of Macedonia leading the way, were induced to interfere in the relations of the west. We have already set forth to some extent the origin of this interference and the course of the first Macedonian war (540-549); and we have pointed out what Philip might have accomplished during the second Punic war, and how little of all that Hannibal was entitled to expect and to count on was really fulfilled.

Page 622

A fresh illustration had been afforded of the truth, that of all haphazards none is more hazardous than an absolute hereditary monarchy. Philip was not the man whom Macedonia at that time required; yet his gifts were far from insignificant. He was a genuine king, in the best and worst sense of the term. A strong desire to rule in person and unaided was the fundamental trait of his character; he was proud of his purple, but he was no less proud of other gifts, and he had reason to be so. He not only showed the valour of a soldier and the eye of a general, but he displayed a high spirit in the conduct of public affairs, whenever his Macedonian sense of honour was offended. Full of intelligence and wit, he won the hearts of all whom he wished to gain, especially of the men who were ablest and most refined, such as Flamininus and Scipio; he was a pleasant boon companion and, not by virtue of his rank alone, a dangerous wooer. But he was at the same time one of the most arrogant and flagitious characters, which that shameless age produced. He was in the habit of saying that he feared none save the gods; but it seemed almost as if his gods were those to whom his admiral Dicaearchus regularly offered sacrifice—Godlessness (-Asebeia-) and Lawlessness (-Paranomia-). The lives of his advisers and of the promoters of his schemes possessed no sacredness in his eyes, nor did he disdain to pacify his indignation against the Athenians and Attalus by the destruction of venerable monuments and illustrious works of art; it is quoted as one of his maxims of state, that “whoever causes the father to be put to death must also kill the sons.” It may be that to him cruelty was not, strictly, a delight; but he was indifferent to the lives and sufferings of others, and relenting, which alone renders men tolerable, found no place in his hard and stubborn heart. So abruptly and harshly did he proclaim the principle that no promise and no moral law are binding on an absolute king, that he thereby interposed the most serious obstacles to the success of his plans. No one can deny that he possessed sagacity and resolution, but these were, in a singular manner, combined with procrastination and supineness; which is perhaps partly to be explained by the fact, that he was called in his eighteenth year to the position of an absolute sovereign, and that his ungovernable fury against every one who disturbed his autocratic course by counter-argument or counter-advice scared away from him all independent counsellors. What various causes cooperated to produce the weak and disgraceful management which he showed in the first Macedonian war, we cannot tell; it may have been due perhaps to that indolent arrogance which only puts forth its full energies against danger when it becomes imminent, or perhaps to his indifference towards a plan which was not of his own devising and his jealousy of the greatness of Hannibal which put him to shame. It is certain that his subsequent conduct betrayed no further trace of the Philip, through whose negligence the plan of Hannibal suffered shipwreck.

Page 623

Macedonia and Asia Attack Egypt

When Philip concluded his treaty with the Aetolians and Romans in 548-9, he seriously intended to make a lasting peace with Rome, and to devote himself exclusively in future to the affairs of the east. It admits of no doubt that he saw with regret the rapid subjugation of Carthage; and it may be, that Hannibal hoped for a second declaration of war from Macedonia, and that Philip secretly reinforced the last Carthaginian army with mercenaries.(2) But the tedious affairs in which he had meanwhile involved himself in the east, as well as the nature of the alleged support, and especially the total silence of the Romans as to such a breach of the peace while they were searching for grounds of war, place it beyond doubt, that Philip was by no means disposed in 551 to make up for what he ought to have done ten years before. He had turned his eyes to an entirely different quarter.

Ptolemy Philopator of Egypt had died in 549. Philip and Antiochus, the kings of Macedonia and Asia, had combined against his successor Ptolemy Epiphanes, a child of five years old, in order completely to gratify the ancient grudge which the monarchies of the mainland entertained towards the maritime state. The Egyptian state was to be broken up; Egypt and Cyprus were to fall to Antiochus Cyrene, Ionia, and the Cyclades to Philip. Thoroughly after the manner of Philip, who ridiculed such considerations, the kings began the war not merely without cause but even without pretext, "just as the large fishes devour the small." The allies, moreover, had made their calculations correctly, especially Philip. Egypt had enough to do in defending herself against the nearer enemy in Syria, and was obliged to leave her possessions in Asia Minor and the Cyclades undefended when Philip threw himself upon these as his share of the spoil. In the year in which Carthage concluded peace with Rome (553), Philip ordered a fleet equipped by the towns subject to him to take on board troops, and to sail along the coast of Thrace. There Lysimachia was taken from the Aetolian garrison, and Perinthus, which stood in the relation of clientship to Byzantium, was likewise occupied. Thus the peace was broken as respected the Byzantines; and as respected the Aetolians, who had just made peace with Philip, the good understanding was at least disturbed. The crossing to Asia was attended with no difficulties, for Prusias king of Bithynia was in alliance with Macedonia. By way of recompense, Philip helped him to subdue the Greek mercantile cities in his territory. Chalcedon submitted. Cius, which resisted, was taken by storm and levelled with the ground, and its inhabitants were reduced to slavery—a meaningless barbarity, which annoyed Prusias himself who wished to get possession of the town uninjured, and which excited profound indignation throughout the Hellenic world. The Aetolians, whose -strategus- had commanded in Cius, and the Rhodians, whose attempts at mediation had been contemptuously and craftily frustrated by the king, were especially offended.

Page 624

The Rhodian Hansa and Pergamus Oppose Philip

But even had this not been so, the interests of all Greek commercial cities were at stake. They could not possibly allow the mild and almost purely nominal Egyptian rule to be supplanted by the Macedonian despotism, with which urban self-government and freedom of commercial intercourse were not at all compatible; and the fearful treatment of the Cians showed that the matter at stake was not the right of confirming the charters of the towns, but the life or death of one and all. Lampsacus had already fallen, and Thasos had been treated like Cius; no time was to be lost. Theophiliscus, the vigilant -strategus-of Rhodes, exhorted his citizens to meet the common danger by common resistance, and not to suffer the towns and islands to become one by one a prey to the enemy. Rhodes resolved on its course, and declared war against Philip. Byzantium joined it; as did also the aged Attalus king of Pergamus, personally and politically the enemy of Philip. While the fleet of the allies was mustering on the Aeolian coast, Philip directed a portion of his fleet to take Chios and Samos. With the other portion he appeared in person before Pergamus, which however he invested in vain; he had to content himself with traversing the level country and leaving the traces of Macedonian valour on the temples which he destroyed far and wide. Suddenly he departed and re-embarked, to unite with his squadron which was at Samos. But the Rhodo-Pergamene fleet followed him, and forced him to accept battle in the straits of Chios. The number of the Macedonian decked vessels was smaller, but the multitude of their open boats made up for this inequality, and the soldiers of Philip fought with great courage. But he was at length defeated. Almost half of his decked vessels, 24 sail, were sunk or taken; 6000 Macedonian sailors and 3000 soldiers perished, amongst whom was the admiral Democrates; 2000 were taken prisoners. The victory cost the allies no more than 800 men and six vessels. But, of the leaders of the allies, Attalus had been cut off from his fleet and compelled to let his own vessel run aground at Erythrae; and Theophiliscus of Rhodes, whose public spirit had decided the question of war and whose valour had decided the battle, died on the day after it of his wounds. Thus while the fleet of Attalus went home and the Rhodian fleet remained temporarily at Chios, Philip, who falsely ascribed the victory to himself, was able to continue his voyage and to turn towards Samos, in order to occupy the Carian towns. On the Carian coast the Rhodians, not on this occasion supported by Attalus, gave battle for the second time to the Macedonian fleet under Heraclides, near the little island of Lade in front of the port of Miletus. The victory, claimed again by both sides, appears to have been this time gained by the Macedonians; for while the Rhodians retreated to Myndus and thence to Cos, the Macedonians occupied Miletus, and a squadron

Page 625

under Dicaearchus the Aetolian occupied the Cyclades. Philip meanwhile prosecuted the conquest of the Rhodian possessions on the Carian mainland, and of the Greek cities: had he been disposed to attack Ptolemy in person, and had he not preferred to confine himself to the acquisition of his own share in the spoil, he would now have been able to think even of an expedition to Egypt. In Caria no army confronted the Macedonians, and Philip traversed without hindrance the country from Magnesia to Mylasa; but every town in that country was a fortress, and the siege-warfare was protracted without yielding or promising any considerable results. Zeuxis the satrap of Lydia supported the ally of his master with the same lukewarmness as Philip had manifested in promoting the interests of the Syrian king, and the Greek cities gave their support only under the pressure of fear or force. The provisioning of the army became daily more difficult; Philip was obliged today to plunder those who but yesterday had voluntarily supplied his wants, and then he had reluctantly to submit to beg afresh. Thus the good season of the year gradually drew to an end, and in the interval the Rhodians had reinforced their fleet and had also been rejoined by that of Attalus, so that they were decidedly superior at sea. It seemed almost as if they might cut off the retreat of the king and compel him to take up winter quarters in Caria, while the state of affairs at home, particularly the threatened intervention of the Aetolians and Romans, urgently demanded his return. Philip saw the danger; he left garrisons amounting together to 3000 men, partly in Myrina to keep Pergamus in check, partly in the petty towns round Mylasa—Iassus, Bargylia, Euromus and Pedasa—to secure for him the excellent harbour and a landing place in Caria; and, owing to the negligence with which the allies guarded the sea, he succeeded in safely reaching the Thracian coast with his fleet and arriving at home before the winter of 553-4.

Diplomatic Intervention of Rome

In fact a storm was gathering against Philip in the west, which did not permit him to continue the plundering of defenceless Egypt. The Romans, who had at length in this year concluded peace on their own terms with Carthage, began to give serious attention to these complications in the east. It has often been affirmed, that after the conquest of the west they forthwith proceeded to the subjugation of the east; a serious consideration will lead to a juster judgment. It is only dull prejudice which fails to see that Rome at this period by no means grasped at the sovereignty of the Mediterranean states, but, on the contrary, desired nothing further than to have neighbours that should not be dangerous in Africa and in Greece; and Macedonia was not really dangerous to Rome. Its power certainly was far from small, and it is evident that the Roman senate only consented with reluctance to the peace of 548-9, which left it in

Page 626

all its integrity; but how little any serious apprehensions of Macedonia were or could be entertained in Rome, is best shown by the small number of troops—who yet were never compelled to fight against a superior force—with which Rome carried on the next war. The senate doubtless would have gladly seen Macedonia humbled; but that humiliation would be too dearly purchased at the cost of a land war carried on in Macedonia with Roman troops; and accordingly, after the withdrawal of the Aetolians, the senate voluntarily concluded peace at once on the basis of the -status quo-. It is therefore far from made out, that the Roman government concluded this peace with the definite design of beginning the war at a more convenient season; and it is very certain that, at the moment, from the thorough exhaustion of the state and the extreme unwillingness of the citizens to enter into a second transmarine struggle, the Macedonian war was in a high degree unwelcome to the Romans. But now it was inevitable. They might have acquiesced in the Macedonian state as a neighbour, such as it stood in 549; but it was impossible that they could permit it to acquire the best part of Asiatic Greece and the important Cyrene, to crush the neutral commercial states, and thereby to double its power. Further, the fall of Egypt and the humiliation, perhaps the subjugation, of Rhodes would have inflicted deep wounds on the trade of Sicily and Italy; and could Rome remain a quiet spectator, while Italian commerce with the east was made dependent on the two great continental powers? Rome had, moreover, an obligation of honour to fulfil towards Attalus her faithful ally since the first Macedonian war, and had to prevent Philip, who had already besieged him in his capital, from expelling him from his dominions. Lastly, the claim of Rome to extend her protecting arm over all the Hellenes was by no means an empty phrase: the citizens of Neapolis, Rhegium, Massilia, and Emporiae could testify that that protection was meant in earnest, and there is no question at all that at this time the Romans stood in a closer relation to the Greeks than any other nation—one little more remote than that of the Hellenized Macedonians. It is strange that any should dispute the right of the Romans to feel their human, as well as their Hellenic, sympathies revolted at the outrageous treatment of the Cians and Thasians.

Preparations and Pretexts for Second Macedonian War

Thus in reality all political, commercial, and moral motives concurred in inducing Rome to undertake the second war against Philip—one of the most righteous, which the city ever waged. It greatly redounds to the honour of the senate, that it immediately resolved on its course and did not allow itself to be deterred from making the necessary preparations either by the exhaustion of the state or by the unpopularity of such a declaration of war. The propraetor Marcus Valerius Laevinus made his appearance as early

Page 627

as 553 with the Sicilian fleet of 38 sail in the eastern waters. The government, however, were at a loss to discover an ostensible pretext for the war; a pretext which they needed in order to satisfy the people, even although they had not been far too sagacious to undervalue, as was the manner of Philip, the importance of assigning a legitimate ground for hostilities. The support, which Philip was alleged to have granted to the Carthaginians after the peace with Rome, manifestly could not be proved. The Roman subjects, indeed, in the province of Illyria had for a considerable time complained of the Macedonian encroachments. In 551 a Roman envoy at the head of the Illyrian levy had driven Philip's troops from the Illyrian territory; and the senate had accordingly declared to the king's envoys in 552, that if he sought war, he would find it sooner than was agreeable to him. But these encroachments were simply the ordinary outrages which Philip practised towards his neighbours; a negotiation regarding them at the present moment would have led to his humbling himself and offering satisfaction, but not to war. With all the belligerent powers in the east the Roman community was nominally in friendly relations, and might have granted them aid in repelling Philip's attack. But Rhodes and Pergamus, which naturally did not fail to request Roman aid, were formally the aggressors; and although Alexandrian ambassadors besought the Roman senate to undertake the guardianship of the boy king, Egypt appears to have been by no means eager to invoke the direct intervention of the Romans, which would put an end to her difficulties for the moment, but would at the same time open up the eastern sea to the great western power. Aid to Egypt, moreover, must have been in the first instance rendered in Syria, and would have entangled Rome simultaneously in a war with Asia and with Macedonia; which the Romans were naturally the more desirous to avoid, as they were firmly resolved not to intermeddle at least in Asiatic affairs. No course was left but to despatch in the meantime an embassy to the east for the purpose, first, of obtaining—what was not in the circumstances difficult—the sanction of Egypt to the interference of the Romans in the affairs of Greece; secondly, of pacifying king Antiochus by abandoning Syria to him; and, lastly, of accelerating as much as possible a breach with Philip and promoting a coalition of the minor Graeco-Asiatic states against him (end of 553). At Alexandria they had no difficulty in accomplishing their object; the court had no choice, and was obliged gratefully to receive Marcus Aemilius Lepidus, whom the senate had despatched as “guardian of the king” to uphold his interests, so far as that could be done without an actual intervention. Antiochus did not break off his alliance with Philip, nor did he give to the Romans the definite explanations which they desired; in other respects, however—whether from remissness, or influenced by the declarations of the Romans that they did not wish to interfere in Syria—he pursued his schemes in that direction and left things in Greece and Asia Minor to take their course.

Page 628

Progress of the War

Meanwhile, the spring of 554 had arrived, and the war had recommenced. Philip first threw himself once more upon Thrace, where he occupied all the places on the coast, in particular Maronea, Aenus, Elaeus, and Sestus; he wished to have his European possessions secured against the risk of a Roman landing. He then attacked Abydus on the Asiatic coast, the acquisition of which could not but be an object of importance to him, for the possession of Sestus and Abydus would bring him into closer connection with his ally Antiochus, and he would no longer need to be apprehensive lest the fleet of the allies might intercept him in crossing to or from Asia Minor. That fleet commanded the Aegean Sea after the withdrawal of the weaker Macedonian squadron: Philip confined his operations by sea to maintaining garrisons on three of the Cyclades, Andros, Cythnos, and Paros, and fitting out privateers. The Rhodians proceeded to Chios, and thence to Tenedos, where Attalus, who had passed the winter at Aegina and had spent his time in listening to the declamations of the Athenians, joined them with his squadron. The allies might probably have arrived in time to help the Abydenes, who heroically defended themselves; but they stirred not, and so at length the city surrendered, after almost all who were capable of bearing arms had fallen in the struggle before the walls. After the capitulation a large portion of the inhabitants fell by their own hand—the mercy of the victor consisted in allowing the Abydenes a term of three days to die voluntarily. Here, in the camp before Abydus, the Roman embassy, which after the termination of its business in Syria and Egypt had visited and dealt with the minor Greek states, met with the king, and submitted the proposals which it had been charged to make by the senate, viz. that the king should wage no aggressive war against any Greek state, should restore the possessions which he had wrested from Ptolemy, and should consent to an arbitration regarding the injury inflicted on the Pergamenes and Rhodians. The object of the senate, which sought to provoke the king to a formal declaration of war, was not gained; the Roman ambassador, Marcus Aemilius Lepidus, obtained from the king nothing but the polite reply that he would excuse what the envoy had said because he was young, handsome, and a Roman.

Meanwhile, however, the occasion for declaring war, which Rome desired, had been furnished from another quarter. The Athenians in their silly and cruel vanity had put to death two unfortunate Acarnanians, because these had accidentally strayed into their mysteries. When the Acarnanians, who were naturally indignant, asked Philip to procure them satisfaction, he could not refuse the just request of his most faithful allies, and he allowed them to levy men in Macedonia and, with these and their own troops, to invade Attica without a formal declaration of war. This, it

Page 629

is true, was no war in the proper sense of the term; and, besides, the leader of the Macedonian band, Nicanor, immediately gave orders to his troops to retreat, when the Roman envoys, who were at Athens at the time, used threatening language (in the end of 553). But it was too late. An Athenian embassy was sent to Rome to report the attack made by Philip on an ancient ally of the Romans; and, from the way in which the senate received it, Philip saw clearly what awaited him; so that he at once, in the very spring of 554, directed Philocles, his general in Greece, to lay waste the Attic territory and to reduce the city to extremities.

Declaration of War by Rome

The senate now had what they wanted; and in the summer of 554 they were able to propose to the comitia a declaration of war “on account of an attack on a state in alliance with Rome.” It was rejected on the first occasion almost unanimously: foolish or evil-disposed tribunes of the people complained of the senate, which would allow the citizens no rest; but the war was necessary and, in strictness, was already begun, so that the senate could not possibly recede. The burgesses were induced to yield by representations and concessions. It is remarkable that these concessions were made mainly at the expense of the allies. The garrisons of Gaul, Lower Italy, Sicily, and Sardinia, amounting in all to 20,000 men, were exclusively taken from the allied contingents that were in active service—quite contrary to the former principles of the Romans. All the burgess troops, on the other hand, that had continued under arms from the Hannibalic war, were discharged; volunteers alone, it was alleged, were to be enrolled for the Macedonian war, but they were, as was afterwards found, for the most part forced volunteers—a fact which in the autumn of 555 called forth a dangerous military revolt in the camp of Apollonia. Six legions were formed of the men newly called out; of these two remained in Rome and two in Etruria, and only two embarked at Brundisium for Macedonia, led by the consul Publius Sulpicius Galba.

Thus it was once more clearly demonstrated, that the sovereign burgess assemblies, with their shortsighted resolutions dependent often on mere accident, were no longer at all fitted to deal with the complicated and difficult relations into which Rome was drawn by her victories; and that their mischievous intervention in the working of the state machine led to dangerous modifications of the measures which in a military point of view were necessary, and to the still more dangerous course of treating the Latin allies as inferiors.

The Roman League

Page 630

The position of Philip was very disadvantageous. The eastern states, which ought to have acted in unison against all interference of Rome and probably under other circumstances would have so acted, had been mainly by Philip's fault so incensed at each other, that they were not inclined to hinder, or were inclined even to promote, the Roman invasion. Asia, the natural and most important ally of Philip, had been neglected by him, and was moreover prevented at first from active interference by being entangled in the quarrel with Egypt and the Syrian war. Egypt had an urgent interest in keeping the Roman fleet out of the eastern waters; even now an Egyptian embassy intimated at Rome very plainly, that the court of Alexandria was ready to relieve the Romans from the trouble of intervention in Attica. But the treaty for the partition of Egypt concluded between Asia and Macedonia threw that important state thoroughly into the arms of Rome, and compelled the cabinet of Alexandria to declare that it would only intermeddle in the affairs of European Greece with consent of the Romans. The Greek commercial cities, with Rhodes, Pergamus, and Byzantium at their head, were in a position similar, but of still greater perplexity. They would under other circumstances have beyond doubt done what they could to close the eastern seas against the Romans; but the cruel and destructive policy of conquest pursued by Philip had driven them to an unequal struggle, in which for their self-preservation they were obliged to use every effort to implicate the great Italian power. In Greece proper also the Roman envoys, who were commissioned to organize a second league against Philip there, found the way already substantially paved for them by the enemy. Of the anti-Macedonian party—the Spartans, Eleans, Athenians, and Aetolians—Philip might perhaps have gained the latter, for the peace of 548 had made a deep, and far from healed, breach in their friendly Alliance with Rome; but apart from the old differences which subsisted between Aetolia and Macedonia regarding the Thessalian towns withdrawn by Macedonia from the Aetolian confederacy—Echinus, Larissa Cremaste, Pharsalus, and Thebes in Phthiotis—the expulsion of the Aetolian garrisons from Lysimachia and Cius had produced fresh exasperation against Philip in the minds of the Aetolians. If they delayed to join the league against him, the chief reason doubtless was the ill-feeling that continued to prevail between them and the Romans.

It was a circumstance still more ominous, that even among the Greek states firmly attached to the interests of Macedonia—the Epirots, Acarnanians, Boeotians, and Achaeans—the Acarnanians and Boeotians alone stood steadfastly by Philip. With the Epirots the Roman envoys negotiated not without success; Amynder, king of the Athamanes, in particular closely attached himself to Rome. Even among the Achaeans, Philip had offended many by the murder of Aratus; while on the other hand he

Page 631

had thereby paved the way for a more free development of the confederacy. Under the leadership of Philopoemen (502-571, for the first time -strategus- in 546) it had reorganized its military system, recovered confidence in itself by successful conflicts with Sparta, and no longer blindly followed, as in the time of Aratus, the policy of Macedonia. The Achaean league, which had to expect neither profit nor immediate injury from the thirst of Philip for aggrandizement, alone in all Hellas looked at this war from an impartial and national-Hellenic point of view. It perceived—what there was no difficulty in perceiving—that the Hellenic nation was thereby surrendering itself to the Romans even before these wished or desired its surrender, and attempted accordingly to mediate between Philip and the Rhodians; but it was too late. The national patriotism, which had formerly terminated the federal war and had mainly contributed to bring about the first war between Macedonia and Rome, was extinguished the Achaean mediation remained fruitless, and in vain Philip visited the cities and islands to rekindle the zeal of the nation—its apathy was the Nemesis for Cius and Abydus. The Achaeans, as they could effect no change and were not disposed to render help to either party, remained neutral.

Landing of the Romans in Macedonia

In the autumn of 554 the consul, Publius Sulpicius Galba, landed with his two legions and 1000 Numidian cavalry accompanied even by elephants derived from the spoils of Carthage, at Apollonia; on receiving accounts of which the king returned in haste from the Hellespont to Thessaly. But, owing partly to the far-advanced season, partly to the sickness of the Roman general, nothing was undertaken by land that year except a reconnaissance in force, in the course of which the townships in the vicinity, and in particular the Macedonian colony Antipatria, were occupied by the Romans. For the next year a joint attack on Macedonia was concerted with the northern barbarians, especially with Pleuratus, the then ruler of Scodra, and Bato, prince of the Dardani, who of course were eager to profit by the favourable opportunity.

More importance attached to the enterprises of the Roman fleet, which numbered 100 decked and 80 light vessels. While the rest of the ships took their station for the winter at Corcyra, a division under Gaius Claudius Cento proceeded to the Piraeus to render assistance to the hard-pressed Athenians. But, as Cento found the Attic territory already sufficiently protected against the raids of the Corinthian garrison and the Macedonian corsairs, he sailed on and appeared suddenly before Chalcis in Euboea, the chief stronghold of Philip in Greece, where his magazines, stores of arms, and prisoners were kept, and where the commandant Sopater was far from expecting a Roman attack. The undefended walls were scaled, and the garrison was put to death; the prisoners were liberated and

Page 632

the stores were burnt; unfortunately, there was a want of troops to hold the important position. On receiving news of this invasion, Philip immediately in vehement indignation started from Demetrias in Thessaly for Chalcis, and when he found no trace of the enemy there save the scene of ruin, he went on to Athens to retaliate. But his attempt to surprise the city was a failure, and even the assault was in vain, greatly as the king exposed his life; the approach of Gaius Claudius from the Piraeus, and of Attalus from Aegina, compelled him to depart. Philip still tarried for some time in Greece; but in a political and in a military point of view his successes were equally insignificant. In vain he tried to induce the Achaeans to take up arms in his behalf; and equally fruitless were his attacks on Eleusis and the Piraeus, as well as a second attempt on Athens itself. Nothing remained for him but to gratify his natural exasperation in an unworthy manner by laying waste the country and destroying the trees of Academus, and then to return to the north.

Attempt of the Romans to Invade Macedonia

Thus the winter passed away. With the spring of 555 the proconsul Publius Sulpicius broke up from his winter camp, determined to conduct his legions from Apollonia by the shortest route into Macedonia proper. This principal attack from the west was to be supported by three subordinate attacks; on the north by an invasion of the Dardani and Illyrians; on the east by an attack on the part of the combined fleet of the Romans and allies, which assembled at Aegina; while lastly the Athamanes, and the Aetolians also, if the attempt to induce them to share in the struggle should prove successful, were to advance from the south. After Galba had crossed the mountains pierced by the Apsus (now the Beratind), and had marched through the fertile plain of Dassaretia, he reached the mountain range which separates Illyria from Macedonia, and crossing it, entered the proper Macedonian territory. Philip had marched to meet him; but in the extensive and thinly-peopled regions of Macedonia the antagonists for a time sought each other in vain; at length they met in the province of Lyncestis, a fertile but marshy plain not far from the north-western frontier, and encamped not 1000 paces apart. Philip's army, after he had been joined by the corps detached to occupy the northern passes, numbered about 20,000 infantry and 2000 cavalry; the Roman army was nearly as strong. The Macedonians however had the great advantage, that, fighting in their native land and well acquainted with its highways and byways, they had little trouble in procuring supplies of provisions, while they had encamped so close to the Romans that the latter could not venture to disperse for any extensive foraging. The consul repeatedly offered battle, but the king persisted in declining it; and the combats between the light troops, although the Romans gained some advantages in them, produced no material alteration.

Page 633

Galba was obliged to break up his camp and to pitch another eight miles off at Octolophus, where he conceived that he could more easily procure supplies. But here too the divisions sent out were destroyed by the light troops and cavalry of the Macedonians; the legions were obliged to come to their help, whereupon the Macedonian vanguard, which had advanced too far, were driven back to their camp with heavy loss; the king himself lost his horse in the action, and only saved his life through the magnanimous self-devotion of one of his troopers. From this perilous position the Romans were liberated through the better success of the subordinate attacks which Galba had directed the allies to make, or rather through the weakness of the Macedonian forces. Although Philip had instituted levies as large as possible in his own dominions, and had enlisted Roman deserters and other mercenaries, he had not been able to bring into the field (over and above the garrisons in Asia Minor and Thrace) more than the army, with which in person he confronted the consul; and besides, in order to form even this, he had been obliged to leave the northern passes in the Pelagonian territory undefended. For the protection of the east coast he relied partly on the orders which he had given for the laying waste of the islands of Sciathus and Peparethus, which might have furnished a station to the enemy's fleet, partly on the garrisoning of Thasos and the coast and on the fleet organized at Demetrias under Heraclides. For the south frontier he had been obliged to reckon solely upon the more than doubtful neutrality of the Aetolians. These now suddenly joined the league against Macedonia, and immediately in conjunction with the Athamanes penetrated into Thessaly, while simultaneously the Dardani and Illyrians overran the northern provinces, and the Roman fleet under Lucius Apustius, departing from Corcyra, appeared in the eastern waters, where the ships of Attalus, the Rhodians, and the Istrians joined it.

Philip, on learning this, voluntarily abandoned his position and retreated in an easterly direction: whether he did so in order to repel the probably unexpected invasion of the Aetolians, or to draw the Roman army after him with a view to its destruction, or to take either of these courses according to circumstances, cannot well be determined. He managed his retreat so dexterously that Galba, who adopted the rash resolution of following him, lost his track, and Philip was enabled to reach by a flank movement, and to occupy, the narrow pass which separates the provinces of Lyncestis and Eordaea, with the view of awaiting the Romans and giving them a warm reception there. A battle took place on the spot which he had selected; but the long Macedonian spears proved unserviceable on the wooded and uneven ground. The Macedonians were partly turned, partly broken, and lost many men.

Return of the Romans

Page 634

But, although Philip's army was after this unfortunate action no longer able to prevent the advance of the Romans, the latter were themselves afraid to encounter further unknown dangers in an impassable and hostile country; and returned to Apollonia, after they had laid waste the fertile provinces of Upper Macedonia—Eordaea, Elymaea, and Orestis. Celetrum, the most considerable town of Orestis (now Kastoria, on a peninsula in the lake of the same name), had surrendered to them: it was the only Macedonian town that opened its gates to the Romans. In the Illyrian land Pelium, the city of the Dassaretae, on the upper confluent of the Apsus, was taken by storm and strongly garrisoned to serve as a future basis for a similar expedition.

Philip did not disturb the Roman main army in its retreat, but turned by forced marches against the Aetolians and Athamanians who, in the belief that the legions were occupying the attention of the king, were fearlessly and recklessly plundering the rich vale of the Peneius, defeated them completely, and compelled such as did not fall to make their escape singly through the well-known mountain paths. The effective strength of the confederacy was not a little diminished by this defeat, and not less by the numerous enlistments made in Aetolia on Egyptian account. The Dardani were chased back over the mountains by Athena-goras, the leader of Philip's light troops, without difficulty and with severe loss. The Roman fleet also did not accomplish much; it expelled the Macedonian garrison from Andros, punished Euboea and Sciathus, and then made attempts on the Chalcidian peninsula, which were, however, vigorously repulsed by the Macedonian garrison at Mende. The rest of the summer was spent in the capture of Oreus in Euboea, which was long delayed by the resolute defence of the Macedonian garrison. The weak Macedonian fleet under Heraclides remained inactive at Heraclea, and did not venture to dispute the possession of the sea with the enemy. The latter went early to winter quarters, the Romans proceeding to the Piraeus and Corcyra, the Rhodians and Pergamenes going home.

Philip might on the whole congratulate himself upon the results of this campaign. The Roman troops, after an extremely troublesome campaign, stood in autumn precisely on the spot whence they had started in spring; and, but for the well-timed interposition of the Aetolians and the unexpected success of the battle at the pass of Eordaea, perhaps not a man of their entire force would have again seen the Roman territory. The fourfold offensive had everywhere failed in its object, and not only did Philip in autumn see his whole dominions cleared of the enemy, but he was able to make an attempt—which, however, miscarried—to wrest from the Aetolians the strong town of Thaumaci, situated on the Aetolo-Thessalian frontier and commanding the plain of the Peneius. If Antiochus, for whose coming Philip vainly supplicated

Page 635

the gods, should unite with him in the next campaign, he might anticipate great successes. For a moment it seemed as if Antiochus was disposed to do so; his army appeared in Asia Minor, and occupied some townships of king Attalus, who requested military protection from the Romans. The latter, however, were not anxious to urge the great-king at this time to a breach: they sent envoys, who in fact obtained an evacuation of the dominions of Attalus. From that quarter Philip had nothing to hope for.

Philip Encamps on the Aous
Flamininus
Philip Driven Back to Tempe
Greece in the Power of the Romans

But the fortunate issue of the last campaign had so raised the courage or the arrogance of Philip, that, after having assured himself afresh of the neutrality of the Achaeans and the fidelity of the Macedonians by the sacrifice of some strong places and of the detested admiral Heraclides, he next spring (556) assumed the offensive and advanced into the territory of the Atintanes, with a view to form a well-entrenched camp in the narrow pass, where the Aous (Viosa) winds its way between the mountains Aeropus and Asnaus. Opposite to him encamped the Roman army reinforced by new arrivals of troops, and commanded first by the consul of the previous year, Publius Villius, and then from the summer of 556 by that year's consul, Titus Quinctius Flamininus. Flamininus, a talented man just thirty years of age, belonged to the younger generation who began to lay aside the patriotism as well as the habits of their forefathers and, though not unmindful of their fatherland, were still more mindful of themselves and of Hellenism. A skilful officer and a better diplomatist, he was in many respects admirably adapted for the management of the troubled affairs of Greece. Yet it would perhaps have been better both for Rome and for Greece, if the choice had fallen on one less full of Hellenic sympathies, and if the general despatched thither had been a man, who would neither have been bribed by delicate flattery nor stung by pungent sarcasm; who would not amidst literary and artistic reminiscences have overlooked the pitiful condition of the constitutions of the Hellenic states; and who, while treating Hellas according to its deserts, would have spared the Romans the trouble of striving after unattainable ideals.

The new commander-in-chief immediately had a conference with the king, while the two armies lay face to face inactive. Philip made proposals of peace; he offered to restore all his own conquests, and to submit to an equitable arbitration regarding the damage inflicted on the Greek cities; but the negotiations broke down, when he was asked to give up ancient possessions of Macedonia and particularly Thessaly. For forty days the two armies lay in the narrow pass of the Aous; Philip would not retire, and Flamininus could not make up his mind whether he should order an assault, or leave the king alone and reattempt the expedition

Page 636

of the previous year. At length the Roman general was helped out of his perplexity by the treachery of some men of rank among the Epirots—who were otherwise well disposed to Macedonia—and especially of Charops. They conducted a Roman corps of 4000 infantry and 300 cavalry by mountain paths to the heights above the Macedonian camp; and, when the consul attacked the enemy's army in front, the advance of that Roman division, unexpectedly descending from the mountains commanding the position, decided the battle. Philip lost his camp and entrenchments and nearly 2000 men, and hastily retreated to the pass of Tempe, the gate of Macedonia proper. He gave up everything which he had held except the fortresses; the Thessalian towns, which he could not defend, he himself destroyed; Pherae alone closed its gates against him and thereby escaped destruction. The Epirots, induced partly by these successes of the Roman arms, partly by the judicious moderation of Flamininus, were the first to secede from the Macedonian alliance. On the first accounts of the Roman victory the Athamanes and Aetolians immediately invaded Thessaly, and the Romans soon followed; the open country was easily overrun, but the strong towns, which were friendly to Macedonia and received support from Philip, fell only after a brave resistance or withstood even the superior foe—especially Atrax on the left bank of the Peneius, where the phalanx stood in the breach as a substitute for the wall. Except these Thessalian fortresses and the territory of the faithful Acarnanians, all northern Greece was thus in the hands of the coalition.

The Achaeans Enter into Alliance with Rome

The south, on the other hand, was still in the main retained under the power of Macedonia by the fortresses of Chalcis and Corinth, which maintained communication with each other through the territory of the Boeotians who were friendly to the Macedonians, and by the Achaean neutrality; and as it was too late to advance into Macedonia this year, Flamininus resolved to direct his land army and fleet in the first place against Corinth and the Achaeans. The fleet, which had again been joined by the Rhodian and Pergamene ships, had hitherto been employed in the capture and pillage of two of the smaller towns in Euboea, Eretria and Carystus; both however, as well as Oreus, were thereafter abandoned, and reoccupied by Philocles the Macedonian commandant of Chalcis. The united fleet proceeded thence to Cenchreae, the eastern port of Corinth, to threaten that strong fortress. On the other side Flamininus advanced into Phocis and occupied the country, in which Elatea alone sustained a somewhat protracted siege: this district, and Anticyra in particular on the Corinthian gulf, were chosen as winter quarters. The Achaeans, who thus saw on the one hand the Roman legions approaching and on the other the Roman fleet already on their own coast, abandoned their morally honourable, but politically

Page 637

untenable, neutrality. After the deputies from the towns most closely attached to Macedonia —Dyme, Megalopolis, and Argos—had left the diet, it resolved to join the coalition against Philip. Cycliades and other leaders of the Macedonian party went into exile; the troops of the Achaeans immediately united with the Roman fleet and hastened to invest Corinth by land, which city—the stronghold of Philip against the Achaeans —had been guaranteed to them on the part of Rome in return for their joining the coalition. Not only, however, did the Macedonian garrison, which was 1300 strong and consisted chiefly of Italian deserters, defend with determination the almost impregnable city, but Philocles also arrived from Chalcis with a division of 1500 men, which not only relieved Corinth but also invaded the territory of the Achaeans and, in concert with the citizens who were favourable to Macedonia, wrested from them Argos. But the recompense of such devotedness was, that the king delivered over the faithful Argives to the reign of terror of Nabis of Sparta. Philip hoped, after the accession of the Achaeans to the Roman coalition, to gain over Nabis who had hitherto been the ally of the Romans; for his chief reason for joining the Roman alliance had been that he was opposed to the Achaeans and since 550 was even at open war with them. But the affairs of Philip were in too desperate a condition for any one to feel satisfaction in joining his side now. Nabis indeed accepted Argos from Philip, but he betrayed the traitor and remained in alliance with Flamininus, who, in his perplexity at being now allied with two powers that were at war with each other, had in the meantime arranged an armistice of four months between the Spartans and Achaeans.

Vain Attempts to Arrange a Peace

Thus winter came on; and Philip once more availed himself of it to obtain if possible an equitable peace. At a conference held at Nicaea on the Maliac gulf the king appeared in person, and endeavoured to come to an understanding with Flamininus. With haughty politeness he repelled the forward insolence of the petty chiefs, and by marked deference to the Romans, as the only antagonists on an equality with him, he sought to obtain from them tolerable terms. Flamininus was sufficiently refined to feel himself flattered by the urbanity of the vanquished prince towards himself and his arrogance towards the allies, whom the Roman as well as the king had learned to despise; but his powers were not ample enough to meet the king's wishes. He granted him a two months' armistice in return for the evacuation of Phocis and Locris, and referred him, as to the main matter, to his government. The Roman senate had long been at one in the opinion that Macedonia must give up all her possessions abroad; accordingly, when the ambassadors of Philip appeared in Rome, they were simply asked whether they had full powers to renounce all Greece and in particular Corinth,

Page 638

Chalcis, and Demetrias, and when they said that they had not, the negotiations were immediately broken off, and it was resolved that the war should be prosecuted with vigour. With the help of the tribunes of the people, the senate succeeded in preventing a change in the chief command—which had often proved so injurious—and in prolonging the command of Flamininus; he obtained considerable reinforcements, and the two former commanders-in-chief, Publius Galba and Publius Villius, were instructed to place themselves at his disposal. Philip resolved once more to risk a pitched battle. To secure Greece, where all the states except the Acarnanians and Boeotians were now in arms against him, the garrison of Corinth was augmented to 6000 men, while he himself, straining the last energies of exhausted Macedonia and enrolling children and old men in the ranks of the phalanx, brought into the field an army of about 26,000 men, of whom 16,000 were Macedonian -phalangitae-.

Philip Proceed to Thessaly Battle of Cynoscephalae

Thus the fourth campaign, that of 557, began. Flamininus despatched a part of the fleet against the Acarnanians, who were besieged in Leucas; in Greece proper he became by stratagem master of Thebes, the capital of Boeotia, in consequence of which the Boeotians were compelled to join at least nominally the alliance against Macedonia. Content with having thus interrupted the communication between Corinth and Chalcis, he proceeded to the north, where alone a decisive blow could be struck. The great difficulties of provisioning the army in a hostile and for the most part desolate country, which had often hampered its operations, were now to be obviated by the fleet accompanying the army along the coast and carrying after it supplies sent from Africa, Sicily, and Sardinia. The decisive blow came, however, earlier than Flamininus had hoped. Philip, impatient and confident as he was, could not endure to await the enemy on the Macedonian frontier: after assembling his army at Dium, he advanced through the pass of Tempe into Thessaly, and encountered the army of the enemy advancing to meet him in the district of Scotussa.

The Macedonian and Roman armies—the latter of which had been reinforced by contingents of the Apolloniates and the Athamanes, by the Cretans sent by Nabis, and especially by a strong band of Aetolians—contained nearly equal numbers of combatants, each about 26,000 men; the Romans, however, had the superiority in cavalry. In front of Scotussa, on the plateau of the Karadagh, during a gloomy day of rain, the Roman vanguard unexpectedly encountered that of the enemy, which occupied a high and steep hill named Cynoscephalae, that lay between the two camps. Driven back into the plain, the Romans were reinforced from the camp by the light troops and the excellent corps of Aetolian cavalry, and now in turn forced the Macedonian vanguard back upon and over the height. But here the Macedonians

Page 639

again found support in their whole cavalry and the larger portion of their light infantry; the Romans, who had ventured forward imprudently, were pursued with great loss almost to their camp, and would have wholly taken to flight, had not the Aetolian horsemen prolonged the combat in the plain until Flamininus brought up his rapidly-arranged legions. The king yielded to the impetuous cry of his victorious troops demanding the continuance of the conflict, and hastily drew up his heavy-armed soldiers for the battle, which neither general nor soldiers had expected on that day. It was important to occupy the hill, which for the moment was quite denuded of troops. The right wing of the phalanx, led by the king in person, arrived early enough to form without trouble in battle order on the height; the left had not yet come up, when the light troops of the Macedonians, put to flight by the legions, rushed up the hill. Philip quickly pushed the crowd of fugitives past the phalanx into the middle division, and, without waiting till Nicanor had arrived on the left wing with the other half of the phalanx which followed more slowly, he ordered the right phalanx to couch their spears and to charge down the hill on the legions, and the rearranged light infantry simultaneously to turn them and fall upon them in flank. The attack of the phalanx, irresistible on so favourable ground, shattered the Roman infantry, and the left wing of the Romans was completely beaten. Nicanor on the other wing, when he saw the king give the attack, ordered the other half of the phalanx to advance in all haste; by this movement it was thrown into confusion, and while the first ranks were already rapidly following the victorious right wing down the hill, and were still more thrown into disorder by the inequality of the ground, the last files were just gaining the height. The right wing of the Romans under these circumstances soon overcame the enemy's left; the elephants alone, stationed upon this wing, annihilated the broken Macedonian ranks. While a fearful slaughter was taking place at this point, a resolute Roman officer collected twenty companies, and with these threw himself on the victorious Macedonian wing, which had advanced so far in pursuit of the Roman left that the Roman right came to be in its rear. Against an attack from behind the phalanx was defenceless, and this movement ended the battle. From the complete breaking up of the two phalanxes we may well believe that the Macedonian loss amounted to 13,000, partly prisoners, partly fallen—but chiefly the latter, because the Roman soldiers were not acquainted with the Macedonian sign of surrender, the raising of the -sarissae-. The loss of the victors was slight. Philip escaped to Larissa, and, after burning all his papers that nobody might be compromised, evacuated Thessaly and returned home.

Page 640

Simultaneously with this great defeat, the Macedonians suffered other discomfitures at all the points which they still occupied; in Caria the Rhodian mercenaries defeated the Macedonian corps stationed there and compelled it to shut itself up in Stratonicea; the Corinthian garrison was defeated by Nicostratus and his Achaeans with severe loss, and Leucas in Acarnania was taken by assault after a heroic resistance. Philip was completely vanquished; his last allies, the Acarnanians, yielded on the news of the battle of Cynoscephalae.

Preliminaries of Peace

It was completely in the power of the Romans to dictate peace; they used their power without abusing it. The empire of Alexander might be annihilated; at a conference of the allies this desire was expressly put forward by the Aetolians. But what else would this mean, than to demolish the rampart protecting Hellenic culture from the Thracians and Celts? Already during the war just ended the flourishing Lysimachia on the Thracian Chersonese had been totally destroyed by the Thracians—a serious warning for the future. Flamininus, who had clearly perceived the bitter animosities subsisting among the Greek states, could never consent that the great Roman power should be the executioner for the grudges of the Aetolian confederacy, even if his Hellenic sympathies had not been as much won by the polished and chivalrous king as his Roman national feeling was offended by the boastings of the Aetolians, the “victors of Cynoscephalae,” as they called themselves. He replied to the Aetolians that it was not the custom of Rome to annihilate the vanquished, and that, besides, they were their own masters and were at liberty to put an end to Macedonia, if they could. The king was treated with all possible deference, and, on his declaring himself ready now to entertain the demands formerly made, an armistice for a considerable term was agreed to by Flamininus in return for the payment of a sum of money and the furnishing of hostages, among whom was the king’s son Demetrius,—an armistice which Philip greatly needed in order to expel the Dardani out of Macedonia.

Peace with Macedonia

The final regulation of the complicated affairs of Greece was entrusted by the senate to a commission of ten persons, the head and soul of which was Flamininus. Philip obtained from it terms similar to those laid down for Carthage. He lost all his foreign possessions in Asia Minor, Thrace, Greece, and in the islands of the Aegean Sea; while he retained Macedonia proper undiminished, with the exception of some unimportant tracts on the frontier and the province of Orestis, which was declared free—a stipulation which Philip felt very keenly, but which the Romans could not avoid prescribing, for with his character it was impossible to leave him free to dispose of subjects who had once revolted from their allegiance. Macedonia was further bound not to conclude any foreign

Page 641

alliances without the previous knowledge of Rome, and not to send garrisons abroad; she was bound, moreover, not to make war out of Macedonia against civilized states or against any allies of Rome at all; and she was not to maintain any army exceeding 5000 men, any elephants, or more than five decked ships—the rest were to be given up to the Romans. Lastly, Philip entered into symmachy with the Romans, which obliged him to send a contingent when requested; indeed, Macedonian troops immediately afterwards fought side by side with the legions. Moreover, he paid a contribution of 1000 talents (244,000 pounds).

Greece Free

After Macedonia had thus been reduced to complete political nullity and was left in possession of only as much power as was needful to guard the frontier of Hellas against the barbarians, steps were taken to dispose of the possessions ceded by the king. The Romans, who just at that time were learning by experience in Spain that transmarine provinces were a very dubious gain, and who had by no means begun the war with a view to the acquisition of territory, took none of the spoil for themselves, and thus compelled their allies also to moderation. They resolved to declare all the states of Greece, which had previously been under Phillip free: and Flamininus was commissioned to read the decree to that effect to the Greeks assembled at the Isthmian games (558). Thoughtful men doubtless might ask whether freedom was a blessing capable of being thus bestowed, and what was the value of freedom to a nation apart from union and unity; but the rejoicing was great and sincere, as the intention of the senate was sincere in conferring the freedom.(2)

Scodra

The Achaean League Enlarged

The Aetolians

The only exceptions to this general rule were, the Illyrian provinces eastward of Epidamnus, which fell to Pleuratus the ruler of Scodra, and rendered that state of robbers and pirates, which a century before had been humbled by the Romans,(3) once more one of the most powerful of the petty principalities in those regions; some townships in western Thessaly, which Amynder had occupied and was allowed to retain; and the three islands of Paros, Scyros, and Imbros, which were presented to Athens in return for her many hardships and her still more numerous addresses of thanks and courtesies of all sorts. The Rhodians, of course, retained their Carian possessions, and the Pergamenes retained Aegina. The remaining allies were only indirectly rewarded by the accession of the newly-liberated cities to the several confederacies. The Achaeans were the best treated, although they were the latest in joining the coalition against Philip; apparently for the honourable reason, that this federation was the best organized and most respectable of all the Greek states. All the

possessions of Philip in the Peloponnesus and on the Isthmus, and consequently Corinth in particular, were incorporated with their

Page 642

league. With the Aetolians on the other hand the Romans used little ceremony; they were allowed to receive the towns of Phocis and Locris into their symmachy, but their attempts to extend it also to Acarnania and Thessaly were in part decidedly rejected, in part postponed, and the Thessalian cities were organized into four small independent confederacies. The Rhodian city-league reaped the benefit of the liberation of Thasos, Lemnos, and the towns of Thrace and Asia Minor.

War against Nabis of Sparta

The regulation of the affairs of the Greek states, as respected both their mutual relations and their internal condition, was attended with difficulty. The most urgent matter was the war which had been carried on between the Spartans and Achaeans since 550, in which the duty of mediating necessarily fell to the Romans. But after various attempts to induce Nabis to yield, and particularly to give up the city of Argos belonging to the Achaean league, which Philip had surrendered to him, no course at last was left to Flamininus but to have war declared against the obstinate petty robber-chieftain, who reckoned on the well-known grudge of the Aetolians against the Romans and on the advance of Antiochus into Europe, and pertinaciously refused to restore Argos. War was declared, accordingly, by all the Hellenes at a great diet in Corinth, and Flamininus advanced into the Peloponnesus accompanied by the fleet and the Romano-allied army, which included a contingent sent by Philip and a division of Lacedaemonian emigrants under Agesipolis, the legitimate king of Sparta (559). In order to crush his antagonist immediately by an overwhelming superiority of force, no less than 50,000 men were brought into the field, and, the other towns being disregarded, the capital itself was at once invested; but the desired result was not attained. Nabis had sent into the field a considerable army amounting to 15,000 men, of whom 5000 were mercenaries, and he had confirmed his rule afresh by a complete reign of terror—by the execution -en masse- of the officers and inhabitants of the country whom he suspected. Even when he himself after the first successes of the Roman army and fleet resolved to yield and to accept the comparatively favourable terms of peace proposed by Flamininus, “the people,” that is to say the gang of robbers whom Nabis had domiciled in Sparta, not without reason apprehensive of a reckoning after the victory, and deceived by an accompaniment of lies as to the nature of the terms of peace and as to the advance of the Aetolians and Asiatics, rejected the peace offered by the Roman general, so that the struggle began anew. A battle took place in front of the walls and an assault was made upon them; they were already scaled by the Romans, when the setting on fire of the captured streets compelled the assailants to retire.

Settlement of Spartan Affairs

Page 643

At last the obstinate resistance came to an end. Sparta retained its independence and was neither compelled to receive back the emigrants nor to join the Achaean league; even the existing monarchical constitution, and Nabis himself, were left intact. On the other hand Nabis had to cede his foreign possessions, Argos, Messene, the Cretan cities, and the whole coast besides; to bind himself neither to conclude foreign alliances, nor to wage war, nor to keep any other vessels than two open boats; and lastly to disgorge all his plunder, to give to the Romans hostages, and to pay to them a war-contribution. The towns on the Laconian coast were given to the Spartan emigrants, and this new community, who named themselves the "free Laconians" in contrast to the monarchically governed Spartans, were directed to enter the Achaean league. The emigrants did not receive back their property, as the district assigned to them was regarded as a compensation for it; it was stipulated, on the other hand, that their wives and children should not be detained in Sparta against their will. The Achaeans, although by this arrangement they gained the accession of the free Laconians as well as Argos, were yet far from content; they had expected that the dreaded and hated Nabis would be superseded, that the emigrants would be brought back, and that the Achaean symmarchy would be extended to the whole Peloponnesus. Unprejudiced persons, however, will not fail to see that Flamininus managed these difficult affairs as fairly and justly as it was possible to manage them where two political parties, both chargeable with unfairness and injustice stood opposed to each other. With the old and deep hostility subsisting between the Spartans and Achaeans, the incorporation of Sparta into the Achaean league would have been equivalent to subjecting Sparta to the Achaeans, a course no less contrary to equity than to prudence. The restitution of the emigrants, and the complete restoration of a government that had been set aside for twenty years, would only have substituted one reign of terror for another; the expedient adopted by Flamininus was the right one, just because it failed to satisfy either of the extreme parties. At length thorough provision appeared to be made that the Spartan system of robbery by sea and land should cease, and that the government there, such as it was, should prove troublesome only to its own subjects. It is possible that Flamininus, who knew Nabis and could not but be aware how desirable it was that he should personally be superseded, omitted to take such a step from the mere desire to have done with the matter and not to mar the clear impression of his successes by complications that might be prolonged beyond all calculation; it is possible, moreover, that he sought to preserve Sparta as a counterpoise to the power of the Achaean confederacy in the Peloponnesus. But the former objection relates to a point of secondary importance; and as to the latter view, it is far from probable that the Romans condescended to fear the Achaeans.

Page 644

Final Regulation of Greece

Peace was thus established, externally at least, among the petty Greek states. But the internal condition of the several communities also furnished employment to the Roman arbiter. The Boeotians openly displayed their Macedonian tendencies, even after the expulsion of the Macedonians from Greece; after Flaminius had at their request allowed their countrymen who were in the service of Philip to return home, Brachyllas, the most decided partisan of Macedonia, was elected to the presidency of the Boeotian confederacy, and Flaminius was otherwise irritated in every way. He bore it with unparalleled patience; but the Boeotians friendly to Rome, who knew what awaited them after the departure of the Romans, determined to put Brachyllas to death, and Flaminius, whose permission they deemed it necessary to ask, at least did not forbid them. Brachyllas was accordingly killed; upon which the Boeotians were not only content with prosecuting the murderers, but lay in wait for the Roman soldiers passing singly or in small parties through their territories, and killed about 500 of them. This was too much to be endured; Flaminius imposed on them a fine of a talent for every soldier; and when they did not pay it, he collected the nearest troops and besieged Coronea (558). Now they betook themselves to entreaty; Flaminius in reality desisted on the intercession of the Achaeans and Athenians, exacting but a very moderate fine from those who were guilty; and although the Macedonian party remained continuously at the helm in the petty province, the Romans met their puerile opposition simply with the forbearance of superior power. In the rest of Greece Flaminius contented himself with exerting his influence, so far as he could do so without violence, over the internal affairs especially of the newly-freed communities; with placing the council and the courts in the hands of the more wealthy and bringing the anti-Macedonian party to the helm; and with attaching as much as possible the civic commonwealths to the Roman interest, by adding everything, which in each community should have fallen by martial law to the Romans, to the common property of the city concerned. The work was finished in the spring of 560; Flaminius once more assembled the deputies of all the Greek communities at Corinth, exhorted them to a rational and moderate use of the freedom conferred on them, and requested as the only return for the kindness of the Romans, that they would within thirty days send to him the Italian captives who had been sold into Greece during the Hannibalic war. Then he evacuated the last fortresses in which Roman garrisons were still stationed, Demetrias, Chalcis along with the smaller forts dependent upon it in Euboea, and Acrocorinthus—thus practically giving the lie to the assertion of the Aetolians that Rome had inherited from Philip the “fetters” of Greece—and departed homeward with all the Roman troops and the liberated captives.

Page 645

Results

It is only contemptible disingenuousness or weakly sentimentality, which can fail to perceive that the Romans were entirely in earnest with the liberation of Greece; and the reason why the plan so nobly projected resulted in so sorry a structure, is to be sought only in the complete moral and political disorganization of the Hellenic nation. It was no small matter, that a mighty nation should have suddenly with its powerful arm brought the land, which it had been accustomed to regard as its primitive home and as the shrine of its intellectual and higher interests, into the possession of full freedom, and should have conferred on every community in it deliverance from foreign taxation and foreign garrisons and the unlimited right of self-government; it is mere paltriness that sees in this nothing save political calculation. Political calculation made the liberation of Greece a possibility for the Romans; it was converted into a reality by the Hellenic sympathies that were at that time indescribably powerful in Rome, and above all in Flamininus himself. If the Romans are liable to any reproach, it is that all of them, and in particular Flamininus who overcame the well-founded scruples of the senate, were hindered by the magic charm of the Hellenic name from perceiving in all its extent the wretched character of the Greek states of that period, and so allowed yet further freedom for the doings of communities which, owing to the impotent antipathies that prevailed alike in their internal and their mutual relations, knew neither how to act nor how to keep quiet. As things stood, it was really necessary at once to put an end to such a freedom, equally pitiful and pernicious, by means of a superior power permanently present on the spot; the feeble policy of sentiment, with all its apparent humanity, was far more cruel than the sternest occupation would have been. In Boeotia for instance Rome had, if not to instigate, at least to permit, a political murder, because the Romans had resolved to withdraw their troops from Greece and, consequently, could not prevent the Greeks friendly to Rome from seeking their remedy in the usual manner of the country. But Rome herself also suffered from the effects of this indecision. The war with Antiochus would not have arisen but for the political blunder of liberating Greece, and it would not have been dangerous but for the military blunder of withdrawing the garrisons from the principal fortresses on the European frontier. History has a Nemesis for every sin—for an impotent craving after freedom, as well as for an injudicious generosity.

Notes for Chapter VIII

1. III. III. Acquisition of Territory in Illyria
2. III. Vi. Stagnation of the War in Italy
3. There are still extant gold staters, with the head of Flamininus and the inscription “- T. Quincti(us)-,” struck in Greece under the government of the liberator of the Hellenes. The use of the Latin language is a significant compliment.

CHAPTER IX

The War with Antiochus of Asia

Antiochus the Great

In the kingdom of Asia the diadem of the Seleucidae had been worn since 531 by king Antiochus the Third, the great-great-grandson of the founder of the dynasty. He had, like Philip, begun to reign at nineteen years of age, and had displayed sufficient energy and enterprise, especially in his first campaigns in the east, to warrant his being without too ludicrous impropriety addressed in courtly style as “the Great.” He had succeeded—more, however, through the negligence of his opponents and of the Egyptian Philopator in particular, than through any ability of his own—in restoring in some degree the integrity of the monarchy, and in reuniting with his crown first the eastern satrapies of Media and Parthyene, and then the separate state which Achaeus had founded on this side of the Taurus in Asia Minor. A first attempt to wrest from the Egyptians the coast of Syria, the loss of which he sorely felt, had, in the year of the battle of the Trasimene lake, met with a bloody repulse from Philopator at Raphia; and Antiochus had taken good care not to resume the contest with Egypt, so long as a man—even though he were but an indolent one—occupied the Egyptian throne. But, after Philopator’s death (549), the right moment for crushing Egypt appeared to have arrived; with that view Antiochus entered into concert with Philip, and had thrown himself upon Coele-Syria, while Philip attacked the cities of Asia Minor. When the Romans interposed in that quarter, it seemed for a moment as if Antiochus would make common cause with Philip against them—the course suggested by the position of affairs, as well as by the treaty of alliance. But, not far-seeing enough to repel at once with all his energy any interference whatever by the Romans in the affairs of the east, Antiochus thought that his best course was to take advantage of the subjugation of Philip by the Romans (which might easily be foreseen), in order to secure the kingdom of Egypt, which he had previously been willing to share with Philip, for himself alone. Notwithstanding the close relations of Rome with the court of Alexandria and her royal ward, the senate by no means intended to be in reality, what it was in name, his “protector;” firmly resolved to give itself no concern about Asiatic affairs except in case of extreme necessity, and to limit the sphere of the Roman power by the Pillars of Hercules and the Hellespont, it allowed the great-king to take his course. He himself was not probably in earnest with the conquest of Egypt proper—which was more easily talked of than achieved—but he contemplated the subjugation of the foreign possessions of Egypt one after another, and at once attacked those in Cilicia as well as in Syria and Palestine. The great victory, which he gained in 556 over the

Page 647

Egyptian general Scopas at Mount Panium near the sources of the Jordan, not only gave him complete possession of that region as far as the frontier of Egypt proper, but so alarmed the Egyptian guardians of the young king that, to prevent Antiochus from invading Egypt, they submitted to a peace and sealed it by the betrothal of their ward to Cleopatra the daughter of Antiochus. When he had thus achieved his first object, he proceeded in the following year, that of the battle of Cynoscephalae, with a strong fleet of 100 decked and 100 open vessels to Asia Minor, to take possession of the districts that formerly belonged to Egypt on the south and west coasts of Asia Minor—probably the Egyptian government had ceded these districts, which were -de facto- in the hands of Philip, to Antiochus under the peace, and had renounced all their foreign possessions in his favour—and to recover the Greeks of Asia Minor generally for his empire. At the same time a strong Syrian land-army assembled in Sardes.

Difficulties with Rome

This enterprise had an indirect bearing on the Romans who from the first had laid it down as a condition for Philip that he should withdraw his garrisons from Asia Minor and should leave to the Rhodians and Pergamenes their territory and to the free cities their former constitution unimpaired, and who had now to look on while Antiochus took possession of them in Philip's place. Attalus and the Rhodians found themselves now directly threatened by Antiochus with precisely the same danger as had driven them a few years before into the war with Philip; and they naturally sought to involve the Romans in this war as well as in that which had just terminated. Already in 555-6 Attalus had requested from the Romans military aid against Antiochus, who had occupied his territory while the troops of Attalus were employed in the Roman war. The more energetic Rhodians even declared to king Antiochus, when in the spring of 557 his fleet appeared off the coast of Asia Minor, that they would regard its passing beyond the Chelidonian islands (off the Lycian coast) as a declaration of war; and, when Antiochus did not regard the threat, they, emboldened by the accounts that had just arrived of the battle at Cynoscephalae, had immediately begun the war and had actually protected from the king the most important of the Carian cities, Caunus, Halicarnassus, and Myndus, and the island of Samos. Most of the half-free cities had submitted to Antiochus, but some of them, more especially the important cities of Smyrna, Alexandria Troas, and Lampsacus, had, on learning the discomfiture of Philip, likewise taken courage to resist the Syrian; and their urgent entreaties were combined with those of the Rhodians.

Page 648

It admits of no doubt, that Antiochus, so far as he was at all capable of forming a resolution and adhering to it, had already made up his mind not only to attach to his empire the Egyptian possessions in Asia, but also to make conquests on his own behalf in Europe and, if not to seek on that account a war with Rome, at any rate to risk it. The Romans had thus every reason to comply with that request of their allies, and to interfere directly in Asia; but they showed little inclination to do so. They not only delayed as long as the Macedonian war lasted, and gave to Attalus nothing but the protection of diplomatic intercession, which, we may add, proved in the first instance effective; but even after the victory, while they doubtless spoke as though the cities which had been in the hands of Ptolemy and Philip ought not to be taken possession of by Antiochus, and while the freedom of the Asiatic cities, Myrina, Abydus, Lampsacus, (1) and Cius, figured in Roman documents, they took not the smallest step to give effect to it, and allowed king Antiochus to employ the favourable opportunity presented by the withdrawal of the Macedonian garrisons to introduce his own. In fact, they even went so far as to submit to his landing in Europe in the spring of 558 and invading the Thracian Chersonese, where he occupied Sestus and Madytus and spent a considerable time in the chastisement of the Thracian barbarians and the restoration of the destroyed Lysimachia, which he had selected as his chief place of arms and as the capital of the newly-instituted satrapy of Thrace. Flamininus indeed, who was entrusted with the conduct of these affairs, sent to the king at Lysimachia envoys, who talked of the integrity of the Egyptian territory and of the freedom of all the Hellenes; but nothing came out of it. The king talked in turn of his undoubted legal title to the ancient kingdom of Lysimachus conquered by his ancestor Seleucus, explained that he was employed not in making territorial acquisitions but only in preserving the integrity of his hereditary dominions, and declined the intervention of the Romans in his disputes with the cities subject to him in Asia Minor. With justice he could add that peace had already been concluded with Egypt, and that the Romans were thus far deprived of any formal pretext for interfering.(2) The sudden return of the king to Asia occasioned by a false report of the death of the young king of Egypt, and the projects which it suggested of a landing in Cyprus or even at Alexandria, led to the breaking off of the conferences without coming to any conclusion, still less producing any result. In the following year, 559, Antiochus returned to Lysimachia with his fleet and army reinforced, and employed himself in organizing the new satrapy which he destined for his son Seleucus. Hannibal, who had been obliged to flee from Carthage, came to him at Ephesus; and the singularly honourable reception accorded to the exile was virtually a declaration of war against Rome.

Page 649

Nevertheless Flamininus in the spring of 560 withdrew all the Roman garrisons from Greece. This was under the existing circumstances at least a mischievous error, if not a criminal acting in opposition to his own better knowledge; for we cannot dismiss the idea that Flamininus, in order to carry home with him the undiminished glory of having wholly terminated the war and liberated Hellas, contented himself with superficially covering up for the moment the smouldering embers of revolt and war. The Roman statesman might perhaps be right, when he pronounced any attempt to bring Greece directly under the dominion of the Romans, and any intervention of the Romans in Asiatic affairs, to be a political blunder; but the opposition fermenting in Greece, the feeble arrogance of the Asiatic king, the residence, at the Syrian head-quarters, of the bitter enemy of the Romans who had already raised the west in arms against Rome—all these were clear signs of the approach of a fresh rising in arms on the part of the Hellenic east, which could not but have for its aim at least to transfer Greece from the clientship of Rome to that of the states opposed to Rome, and, if this object should be attained, would immediately extend the circle of its operations. It is plain that Rome could not allow this to take place. When Flamininus, ignoring all these sure indications of war, withdrew the garrisons from Greece, and yet at the same time made demands on the king of Asia which he had no intention of employing his army to support, he overdid his part in words as much as he fell short in action, and forgot his duty as a general and as a citizen in the indulgence of his personal vanity—a vanity, which wished to confer, and imagined that it had conferred, peace on Rome and freedom on the Greeks of both continents.

Preparations of Antiochus for War with Rome

Antiochus employed the unexpected respite in strengthening his position at home and his relations with his neighbours before beginning the war, on which for his part he was resolved, and became all the more so, the more the enemy appeared to procrastinate. He now (561) gave his daughter Cleopatra, previously betrothed, in marriage to the young king of Egypt. That he at the same time promised to restore the provinces wrested from his son-in-law, was afterwards affirmed on the part of Egypt, but probably without warrant; at any rate the land remained actually attached to the Syrian kingdom. (3) He offered to restore to Eumenes, who had in 557 succeeded his father Attalus on the throne of Pergamus, the towns taken from him, and to give him also one of his daughters in marriage, if he would abandon the Roman alliance. In like manner he bestowed a daughter on Ariarathes, king of Cappadocia, and gained the Galatians by presents, while he reduced by arms the Pisidians who were constantly in revolt, and other small tribes. Extensive privileges were granted to the Byzantines; respecting the cities in Asia Minor, the king declared that he

Page 650

would permit the independence of the old free cities such as Rhodes and Cyzicus, and would be content in the case of the others with a mere formal recognition of his sovereignty; he even gave them to understand that he was ready to submit to the arbitration of the Rhodians. In European Greece he could safely count on the Aetolians, and he hoped to induce Philip again to take up arms. In fact, a plan of Hannibal obtained the royal approval, according to which he was to receive from Antiochus a fleet of 100 sail and a land army of 10,000 infantry and 1000 cavalry, and was to employ them in kindling first a third Punic war in Carthage, and then a second Hannibalic war in Italy; Tyrian emissaries proceeded to Carthage to pave the way for a rising in arms there⁽⁴⁾ Finally, good results were anticipated from the Spanish insurrection, which, at the time when Hannibal left Carthage, was at its height.⁽⁵⁾

Aetolian Intrigues against Rome

While the storm was thus gathering from far and wide against Rome, it was on this, as on all occasions, the Hellenes implicated in the enterprise, who were of the least moment, and yet took action of the greatest importance and with the utmost impatience. The exasperated and arrogant Aetolians began by degrees to persuade themselves that Philip had been vanquished by them and not by the Romans, and could not even wait till Antiochus should advance into Greece. Their policy is characteristically expressed in the reply, which their -strategus-gave soon afterwards to Flamininus, when he requested a copy of the declaration of war against Rome: that he would deliver it to him in person, when the Aetolian army should encamp on the Tiber. The Aetolians acted as the agents of the Syrian king in Greece and deceived both parties, by representing to the king that all the Hellenes were waiting with open arms to receive him as their true deliverer, and by telling those in Greece who were disposed to listen to them that the landing of the king was nearer than it was in reality. Thus they actually succeeded in inducing the simple obstinacy of Nabis to break loose and to rekindle in Greece the flame of war two years after Flamininus's departure, in the spring of 562; but in doing so they missed their aim. Nabis attacked Gythium, one of the towns of the free Laconians that by the last treaty had been annexed to the Achaean league, and took it; but the experienced -strategus- of the Achaeans, Philopoemen, defeated him at the Barbosthenian mountains, and the tyrant brought back barely a fourth part of his army to his capital, in which Philopoemen shut him up. As such a commencement was no sufficient inducement for Antiochus to come to Europe, the Aetolians resolved to possess themselves of Sparta, Chalcis, and Demetrias, and by gaining these important towns to prevail upon the king to embark. In the first place they thought to become masters of Sparta, by arranging that the Aetolian Alexamenus should march

Page 651

with 1000 men into the town under pretext of bringing a contingent in terms of the alliance, and should embrace the opportunity of making away with Nabis and of occupying the town. This was done, and Nabis was killed at a review of the troops; but, when the Aetolians dispersed to plunder the town, the Lacedaemonians found time to rally and slew them to the last man. The city was then induced by Philopoemen to join the Achaean league. After this laudable project of the Aetolians had thus not only deservedly failed, but had had precisely the opposite effect of uniting almost the whole Peloponnesus in the hands of the other party, it fared little better with them at Chalcis, for the Roman party there called in the citizens of Eretria and Carystus in Euboea, who were favourable to Rome, to render seasonable aid against the Aetolians and the Chalcidian exiles. On the other hand the occupation of Demetrias was successful, for the Magnetes to whom the city had been assigned were, not without reason, apprehensive that it had been promised by the Romans to Philip as a prize in return for his aid against Antiochus; several squadrons of Aetolian horse moreover managed to steal into the town under the pretext of forming an escort for Eurylochus, the recalled head of the opposition to Rome. Thus the Magnetes passed over, partly of their own accord, partly by compulsion, to the side of the Aetolians, and the latter did not fail to make use of the fact at the court of the Seleucid.

Rupture between Antiochus and the Romans

Antiochus took his resolution. A rupture with Rome, in spite of endeavours to postpone it by the diplomatic palliative of embassies, could no longer be avoided. As early as the spring of 561 Flamininus, who continued to have the decisive voice in the senate as to eastern affairs, had expressed the Roman ultimatum to the envoys of the king, Menippus and Hegesianax; viz. that he should either evacuate Europe and dispose of Asia at his pleasure, or retain Thrace and submit to the Roman protectorate over Smyrna, Lampsacus, and Alexandria Troas. These demands had been again discussed at Ephesus, the chief place of arms and fixed quarters of the king in Asia Minor, in the spring of 562, between Antiochus and the envoys of the senate, Publius Sulpicius and Publius Villius; and they had separated with the conviction on both sides that a peaceful settlement was no longer possible. Thenceforth war was resolved on in Rome. In that very summer of 562 a Roman fleet of 30 sail, with 3000 soldiers on board, under Aulus Atilius Serranus, appeared off Gythium, where their arrival accelerated the conclusion of the treaty between the Achaeans and Spartans; the eastern coasts of Sicily and Italy were strongly garrisoned, so as to be secure against any attempts at a landing; a land army was expected in Greece in the autumn. Since the spring of 562 Flamininus, by direction of the senate, had journeyed through Greece to thwart the intrigues of the opposite

Page 652

party, and to counteract as far as possible the evil effects of the ill-timed evacuation of the country. The Aetolians had already gone so far as formally to declare war in their diet against Rome. But Flamininus succeeded in saving Chalcis for the Romans by throwing into it a garrison of 500 Achaeans and 500 Pergamenes. He made an attempt also to recover Demetrias; and the Magnetes wavered. Though some towns in Asia Minor, which Antiochus had proposed to subdue before beginning the great war, still held out, he could now no longer delay his landing, unless he was willing to let the Romans recover all the advantages which they had surrendered two years before by withdrawing their garrisons from Greece. He collected the vessels and troops which were at hand—he had but 40 decked vessels and 10,000 infantry, along with 500 horse and 6 elephants—and started from the Thracian Chersonese for Greece, where he landed in the autumn of 562 at Pteleum on the Pagasaeon gulf, and immediately occupied the adjoining Demetrias. Nearly about the same time a Roman army of some 25,000 men under the praetor Marcus Baebius landed at Apollonia. The war was thus begun on both sides.

Attitude of the Minor Powers Carthage and Hannibal

Everything depended on the extent to which that comprehensively-planned coalition against Rome, of which Antiochus came forward as the head, might be realized. As to the plan, first of all, of stirring up enemies to the Romans in Carthage and Italy, it was the fate of Hannibal at the court of Ephesus, as through his whole career, to have projected his noble and high-spirited plans for the behoof of people pedantic and mean. Nothing was done towards their execution, except that some Carthaginian patriots were compromised; no choice was left to the Carthaginians but to show unconditional submission to Rome. The camarilla would have nothing to do with Hannibal—such a man was too inconveniently great for court cabals; and, after having tried all sorts of absurd expedients, such as accusing the general, with whose name the Romans frightened their children, of concert with the Roman envoys, they succeeded in persuading Antiochus the Great, who like all insignificant monarchs plumed himself greatly on his independence and was influenced by nothing so easily as by the fear of being ruled, into the wise belief that he ought not to allow himself to be thrown into the shade by so celebrated a man. Accordingly it was in solemn council resolved that the Phoenician should be employed in future only for subordinate enterprises and for giving advice—with the reservation, of course, that the advice should never be followed. Hannibal revenged himself on the rabble, by accepting every commission and brilliantly executing all.

States of Asia Minor

Page 653

In Asia Cappadocia adhered to the great-king; Prusias of Bithynia on the other hand took, as always, the side of the stronger. King Eumenes remained faithful to the old policy of his house, which was now at length to yield to him its true fruit. He had not only persistently refused [the offers of Antiochus, but had constantly urged the Romans to a war, from which he expected the aggrandizement of his kingdom. The Rhodians and Byzantines likewise joined their old allies. Egypt too took the side of Rome and offered support in supplies and men; which, however, the Romans did not accept.

Macedonia

In Europe the result mainly depended on the position which Philip of Macedonia would take up. It would have been perhaps the right policy for him, notwithstanding all the injuries or shortcomings of the past, to unite with Antiochus. But Philip was ordinarily influenced not by such considerations, but by his likings and dislikings; and his hatred was naturally directed much more against the faithless ally, who had left him to contend alone with the common enemy, had sought merely to seize his own share in the spoil, and had become a burdensome neighbour to him in Thrace, than against the conqueror, who had treated him respectfully and honourably. Antiochus had, moreover, given deep offence to the hot temper of Philip by the setting up of absurd pretenders to the Macedonian crown, and by the ostentatious burial of the Macedonian bones bleaching at Cynoscephalae. Philip therefore placed his whole force with cordial zeal at the disposal of the Romans.

The Lesser Greek States

The second power of Greece, the Achaean league, adhered no less decidedly than the first to the alliance with Rome. Of the smaller powers, the Thessalians and the Athenians held by Rome; among the latter an Achaean garrison introduced by Flamininus into the citadel brought the patriotic party, which was pretty strong, to reason. The Epirots exerted themselves to keep on good terms, if possible, with both parties. Thus, in addition to the Aetolians and the Magnetes who were joined by a portion of the neighbouring Perrhaebians, Antiochus was supported only by Amynder, the weak king of the Athamanes, who allowed himself to be dazzled by foolish designs on the Macedonian crown; by the Boeotians, among whom the party opposed to Rome was still at the helm; and in the Peloponnesus by the Eleans and Messenians, who were in the habit of taking part with the Aetolians against the Achaeans. This was indeed a hopeful beginning; and the title of commander-in-chief with absolute power, which the Aetolians decreed to the great-king, seemed insult added to injury. There had been, just as usual, deception on both sides. Instead of the countless hordes of Asia, the king brought up a force scarcely half as strong as an ordinary consular army; and instead of the open arms with which all the Hellenes were to welcome their deliverer from the Roman yoke, one or two bands of klephts and some dissolute civic communities offered to the king brotherhood in arms.

Page 654

Antiochus in Greece

For the moment, indeed, Antiochus had anticipated the Romans in Greece proper. Chalcis was garrisoned by the Greek allies of the Romans, and refused the first summons but the fortress surrendered when Antiochus advanced with all his force; and a Roman division, which arrived too late to occupy it, was annihilated by Antiochus at Delium. Euboea was thus lost to the Romans. Antiochus still made even in winter an attempt, in concert with the Aetolians and Athamanes, to gain Thessaly; Thermopylae was occupied, Pherae and other towns were taken, but Appius Claudius came up with 2000 men from Apollonia, relieved Larisa, and took up his position there. Antiochus, tired of the winter campaign, preferred to return to his pleasant quarters at Chalcis, where the time was spent merrily, and the king even, in spite of his fifty years and his warlike schemes, wedded a fair Chalcidian. So the winter of 562-3 passed, without Antiochus doing much more than sending letters hither and thither through Greece: he waged the war—a Roman officer remarked—by means of pen and ink.

Landing of the Romans

In the beginning of spring 563 the Roman staff arrived at Apollonia. The commander-in-chief was Manius Acilius Glabrio, a man of humble origin, but an able general feared both by his soldiers and by the enemy; the admiral was Gaius Livius; and among the military tribunes were Marcus Porcius Cato, the conqueror of Spain, and Lucius Valerius Flaccus, who after the old Roman wont did not disdain, although they had been consuls, to re-enter the army as simple war-tribunes. They brought with them reinforcements in ships and men, including Numidian cavalry and Libyan elephants sent by Massinissa, and the permission of the senate to accept auxiliary troops to the number of 5000 from the extra-Italian allies, so that the whole number of the Roman forces was raised to about 40,000 men. The king, who in the beginning of spring had gone to the Aetolians and had thence made an aimless expedition to Acarnania, on the news of Glabrio's landing returned to his head-quarters to begin the campaign in earnest. But incomprehensibly, through his own negligence and that of his lieutenants in Asia, reinforcements had wholly failed to reach him, so that he had nothing but the weak army—now further decimated by sickness and desertion in its dissolute winter-quarters—with which he had landed at Pteleum in the autumn of the previous year. The Aetolians too, who had professed to send such enormous numbers into the field, now, when their support was of moment, brought to their commander-in-chief no more than 4000 men. The Roman troops had already begun operations in Thessaly, where the vanguard in concert with the Macedonian army drove the garrisons of Antiochus out of the Thessalian towns and occupied the territory of the Athamanes. The consul with the main army followed; the whole force of the Romans assembled at Larisa.

Page 655

Battle at Thermopylae
Greece Occupied by the Romans
Resistance of the Aetolians

Instead of returning with all speed to Asia and evacuating the field before an enemy in every respect superior, Antiochus resolved to entrench himself at Thermopylae, which he had occupied, and there to await the arrival of the great army from Asia. He himself took up a position in the chief pass, and commanded the Aetolians to occupy the mountain-path, by which Xerxes had formerly succeeded in turning the Spartans. But only half of the Aetolian contingent was pleased to comply with this order of the commander-in-chief; the other 2000 men threw themselves into the neighbouring town of Heraclea, where they took no other part in the battle than that of attempting during its progress to surprise and plunder the Roman camp. Even the Aetolians posted on the heights discharged their duty of watching with remissness and reluctance; their post on the Callidromus allowed itself to be surprised by Cato, and the Asiatic phalanx, which the consul had meanwhile assailed in front, dispersed, when the Romans hastening down the mountain fell upon its flank. As Antiochus had made no provision for any case and had not thought of retreat, the army was destroyed partly on the field of battle, partly during its flight; with difficulty a small band reached Demetrias, and the king himself escaped to Chalcis with 500 men. He embarked in haste for Ephesus; Europe was lost to him all but his possessions in Thrace, and even the fortresses could be no longer defended. Chalcis surrendered to the Romans, and Demetrias to Philip, who received permission—as a compensation for the conquest of the town of Lamia in Achaia Phthiotis, which he was on the point of accomplishing and had then abandoned by orders of the consul—to make himself master of all the communities that had gone over to Antiochus in Thessaly proper, and even of the territories bordering on Aetolia, the districts of Dolopia and Aperantia. All the Greeks that had pronounced in favour of Antiochus hastened to make their peace; the Epirots humbly besought pardon for their ambiguous conduct, the Boeotians surrendered at discretion, the Eleans and Messenians, the latter after some struggle, submitted to the Achaeans. The prediction of Hannibal to the king was fulfilled, that no dependence at all could be placed upon the Greeks, who would submit to any conqueror. Even the Aetolians, when their corps shut up in Heraclea had been compelled after obstinate resistance to capitulate, attempted to make their peace with the sorely provoked Romans; but the stringent demands of the Roman consul, and a consignment of money seasonably arriving from Antiochus, emboldened them once more to break off the negotiations and to sustain for two whole months a siege in Naupactus. The town was already reduced to extremities, and its capture or capitulation could not have been long delayed, when Flamininus, constantly striving to save every Hellenic community from the worst consequences of its own folly and from the severity of his ruder colleagues, interposed and arranged in the first instance an armistice on tolerable terms. This terminated, at least for the moment, armed resistance in Greece.

Maritime War, and Preparations for Crossing to Asia
Polyxenidas and Pausistratus
Engagement off Aspendus
Battle of Myonnesus

A more serious war was impending in Asia—a war which appeared of a very hazardous character on account not so much of the enemy as of the great distance and the insecurity of the communications with home, while yet, owing to the short-sighted obstinacy of Antiochus, the struggle could not well be terminated otherwise than by an attack on the enemy in his own country. The first object was to secure the sea. The Roman fleet, which during the campaign in Greece was charged with the task of interrupting the communication between Greece and Asia Minor, and which had been successful about the time of the battle at Thermopylae in seizing a strong Asiatic transport fleet near Andros, was thenceforth employed in making preparations for the crossing of the Romans to Asia next year and first of all in driving the enemy's fleet out of the Aegean Sea. It lay in the harbour of Cyssus on the southern shore of the tongue of land that projects from Ionia towards Chios; thither in search of it the Roman fleet proceeded, consisting of 75 Roman, 24 Pergamene, and 6 Carthaginian, decked vessels under the command of Gaius Livius. The Syrian admiral, Polyxenidas, a Rhodian emigrant, had only 70 decked vessels to oppose to it; but, as the Roman fleet still expected the ships of Rhodes, and as Polyxenidas relied on the superior seaworthiness of his vessels, those of Tyre and Sidon in particular, he immediately accepted battle. At the outset the Asiatics succeeded in sinking one of the Carthaginian vessels; but, when they came to grapple, Roman valour prevailed, and it was owing solely to the swiftness of their rowing and sailing that the enemy lost no more than 23 ships. During the pursuit the Roman fleet was joined by 25 ships from Rhodes, and the superiority of the Romans in those waters was now doubly assured. The enemy's fleet thenceforth kept the shelter of the harbour of Ephesus, and, as it could not be induced to risk a second battle, the fleet of the Romans and allies broke up for the winter; the Roman ships of war proceeded to the harbour of Cane in the neighbourhood of Pergamus. Both parties were busy during the winter in preparing for the next campaign. The Romans sought to gain over the Greeks of Asia Minor; Smyrna, which had perseveringly resisted all the attempts of the king to get possession of the city, received the Romans with open arms, and the Roman party gained the ascendancy in Samos, Chios, Erythrae, Clazomenae, Phocaea, Cyme, and elsewhere. Antiochus was resolved, if possible, to prevent the Romans from crossing to Asia, and with that view he made zealous naval preparations—employing Polyxenidas to fit out and augment the fleet stationed at Ephesus, and Hannibal to equip a new fleet in Lycia, Syria, and Phoenicia; while he further collected in Asia Minor a powerful land army from all regions of

Page 657

his extensive empire. Early next year (564) the Roman fleet resumed its operations. Gaius Livius left the Rhodian fleet—which had appeared in good time this year, numbering 36 sail—to observe that of the enemy in the offing of Ephesus, and went with the greater portion of the Roman and Pergamene vessels to the Hellespont in accordance with his instructions, to pave the way for the passage of the land army by the capture of the fortresses there. Sestus was already occupied and Abydus reduced to extremities, when the news of the defeat of the Rhodian fleet recalled him. The Rhodian admiral Pausistratus, lulled into security by the representations of his countryman that he wished to desert from Antiochus, had allowed himself to be surprised in the harbour of Samos; he himself fell, and all his vessels were destroyed except five Rhodian and two Coan ships; Samos, Phocaea, and Cyme on hearing the news went over to Seleucus, who held the chief command by land in those provinces for his father.

But when the Roman fleet arrived partly from Cane, partly from the Hellespont, and was after some time joined by twenty new ships of the Rhodians at Samos, Polyxenidas was once more compelled to shut himself up in the harbour of Ephesus. As he declined the offered naval battle, and as, owing to the small numbers of the Roman force, an attack by land was not to be thought of, nothing remained for the Roman fleet but to take up its position in like manner at Samos. A division meanwhile proceeded to Patara on the Lycian coast, partly to relieve the Rhodians from the very troublesome attacks that were directed against them from that quarter, partly and chiefly to prevent the hostile fleet, which Hannibal was expected to bring up, from entering the Aegean Sea. When the squadron sent against Patara achieved nothing, the new admiral Lucius Aemilius Regillus, who had arrived with 20 war-vessels from Rome and had relieved Gaius Livius at Samos, was so indignant that he proceeded thither with the whole fleet; his officers with difficulty succeeded, while they were on their voyage, in making him understand that the primary object was not the conquest of Patara but the command of the Aegean Sea, and in inducing him to return to Samos. On the mainland of Asia Minor Seleucus had in the meanwhile begun the siege of Pergamus, while Antiochus with his chief army ravaged the Pergamene territory and the possessions of the Mytilenaeans on the mainland; they hoped to crush the hated Attalids, before Roman aid appeared. The Roman fleet went to Elaea and the port of Adramytium to help their ally; but, as the admiral wanted troops, he accomplished nothing. Pergamus seemed lost; but the laxity and negligence with which the siege was conducted allowed Eumenes to throw into the city Achaean auxiliaries under Diophanes, whose bold and successful sallies compelled the Gallic mercenaries, whom Antiochus had entrusted with the siege, to raise it.

Page 658

In the southern waters too the projects of Antiochus were frustrated. The fleet equipped and led by Hannibal, after having been long detained by the constant westerly winds, attempted at length to reach the Aegean; but at the mouth of the Eurymedon, off Aspendus in Pamphylia, it encountered a Rhodian squadron under Eudamus; and in the battle, which ensued between the two fleets, the excellence of the Rhodian ships and naval officers carried the victory over Hannibal's tactics and his numerical superiority. It was the first naval battle, and the last battle against Rome, fought by the great Carthaginian. The victorious Rhodian fleet then took its station at Patara, and there prevented the intended junction of the two Asiatic fleets. In the Aegean Sea the Romano-Rhodian fleet at Samos, after being weakened by detaching the Pergamene ships to the Hellespont to support the land army which had arrived there, was in its turn attacked by that of Polyxenidas, who now numbered nine sail more than his opponents. On December 23 of the uncorrected calendar, according to the corrected calendar about the end of August, in 564, a battle took place at the promontory of Myonnesus between Teos and Colophon; the Romans broke through the line of the enemy, and totally surrounded the left wing, so that they took or sank 42 ships. An inscription in Saturnian verse over the temple of the Lares Permarini, which was built in the Campus Martius in memory of this victory, for many centuries thereafter proclaimed to the Romans how the fleet of the Asiatics had been defeated before the eyes of king Antiochus and of all his land army, and how the Romans thus "settled the mighty strife and subdued the kings." Thenceforth the enemy's ships no longer ventured to show themselves on the open sea, and made no further attempt to obstruct the crossing of the Roman land army.

Expedition to Asia

The conqueror of Zama had been selected at Rome to conduct the war on the Asiatic continent; he practically exercised the supreme command for the nominal commander-in-chief, his brother Lucius Scipio, whose intellect was insignificant, and who had no military capacity. The reserve hitherto stationed in Lower Italy was destined for Greece, the army of Glabrio for Asia: when it became known who was to command it, 5000 veterans from the Hannibalic war voluntarily enrolled, to fight once more under their beloved leader. In the Roman July, but according to the true time in March, the Scipios arrived at the army to commence the Asiatic campaign; but they were disagreeably surprised to find themselves instead involved, in the first instance, in an endless struggle with the desperate Aetolians. The senate, finding that Flaminius pushed his boundless consideration for the Hellenes too far, had left the Aetolians to choose between paying an utterly exorbitant war contribution and unconditional surrender, and thus had driven them anew to arms; none could tell when

Page 659

this warfare among mountains and strongholds would come to an end. Scipio got rid of the inconvenient obstacle by concerting a six-months' armistice, and then entered on his march to Asia. As the one fleet of the enemy was only blockaded in the Aegean Sea, and the other, which was coming up from the south, might daily arrive there in spite of the squadron charged to intercept it, it seemed advisable to take the land route through Macedonia and Thrace and to cross the Hellespont. In that direction no real obstacles were to be anticipated; for Philip of Macedonia might be entirely depended on, Prusias king of Bithynia was in alliance with the Romans, and the Roman fleet could easily establish itself in the straits. The long and weary march along the coast of Macedonia and Thrace was accomplished without material loss; Philip made provision on the one hand for supplying their wants, on the other for their friendly reception by the Thracian barbarians. They had lost so much time however, partly with the Aetolians, partly on the march, that the army only reached the Thracian Chersonese about the time of the battle of Myonnesus. But the marvellous good fortune of Scipio now in Asia, as formerly in Spain and Africa, cleared his path of all difficulties.

Passage of the Hellespont by the Romans
